George D. Macdougall, M.E.I.C. chief engineer of the British Empire Steel Corporation, was elected president of the Nova Scotia Mining Society at a meeting held at Sydney N.S., on May 30th. Among the other officers, who were elected are the following members of *The Institute*, C.M. Odell, M.E.I.C., T. J. Brown, M.E.I.C., R. E. Chambers, M.E.I.C., F. W. Gray, A.M.E.I.C., D. H. McDougall, M.E.I.C., and J. J. McDougall, A.M.E.I.C.

E. S. M. Lovelace, M.E.I.C., formerly of the firm of Ewing, Lovelace and Tremblay, has entered into partnership with Altheod Tremblay, A.M.E.I.C., and will carry on the practice of civil engineering and land surveying with offices in the Birks Building, 14, Phillips Square, Montreal. Mr. Tremblay, whose residence is in Quebec, is a professor at Laval University, a Dominion Land Surveyor and a member of the Board of the Quebec Land Surveyors.

G. Gordon Gale, M.E.I.C., and Fred D. Burpee, Associate E.I.C., the street railway magnates of Hull and Ottawa, respectively, attended the annual convention of the Electric Railway Association at Quebec. Honours are coming fast for Mr. Burpee. Just recovering from piloting the Ottawa Rotary Club through a strenuous year, he is elected to the board of directors of the Ottawa Electric Railway. He has now been elected president of the Electric Railway Association, at its recent convention at Quebec.

Ralph W. Downie, S.E.I.C., has been elected secretary-treasurer of the Niagara Peninsula Branch succeeding Rex P. Johnson, A.M.E.I.C., whose resignation was the result of his appointment to a new position in Chicago. Mr. Downie graduated from the University of Toronto last year and has been engaged in various engineering works for the last nine years, included in which are four and a half years overseas with the Canadian Engineers. He is at present engaged in connection with the Welland Ship canal as tester of building materials.

R. L. Dobbin, M.E.I.C., member of Council and vice-chairman of the Peterborough Branch of *The Institute*, has been elected chairman of the Canadian Section of the American Water Works Association. Mr. Dobbin has been actively engaged on water-supply engineering almost continuously since he graduated from the University of Toronto in 1910, first as resident engineer for the Walter J. Francis Company on the construction of the new system for the city of Moose Jaw, Sask., and later in 1914, as superintendent of waterworks for the Peterborought Utilities Commission, which position he still holds.

Rex P. Johnson, A.M.E.I.C., secretary-treasurer of the Niagara Peninsula Branch since 1919 and office engineer of the Hydro-Electric Power Commission, has joined the staff of the Forest Products Engineering Company of Chicago where his duties will be principally efficiency work in woodworking plants. Before taking up his new duties Mr. Johnson expects to visit the Atlantic coast for a month's holiday. With Mr. Johnson's removal, the Niagara Peninsula Branch loses a very active and energetic worker, and the congratulations and good wishes of the Branch, and *The Institute* as a whole, are extended to him in his new appointment.

C. R. McCort, A.M.E.I.C., has been appointed superintendent of construction for the Thompson-Starrett Company, Limited, in connection with the new mill being built at Three Rivers, Quebec, for the St. Lawrence Paper Mills, Limited. Mr. McCort graduated from the University of Toronto in 1915 and spent nine months of that year on research work, investigating the strength of structural timbers at the Forest Products Laboratories of Canada, at McGill University. On returning from overseas at the end of the war Mr. McCort was appointed field engineer on construction for the Laurentide Company, Limited, at Grand Mere, on which work he was superintendent of construction prior to his recent appointment.

EMPLOYMENT BUREAU

AND

MEMBERS' EXCHANGE

To make this department more valuable it is proposed that in future advertisements of situations vacant should state salary, and give details of requirements.

Situations Wanted

Civil and Mechanical Engineer

Position desired by civil and mechanical engineer with some experience in electrical and mining engineering and eleven years' experience on railway work including surveys and construction as draughtsman, instrumentman and resident engineer; can speak French and German and has a knowledge of Spanish and Italian. Apply Box No. 107.

Civil and Electrical Engineer

Recent graduate in electrical engineering from Nova Scotia Technical College, age 26, three years service overseas, two summers on instrument work in connection with power development in Nova Scotia. Desires employment on any type of engineering work. Apply Box No. 105.

Civil Engineer

Recent graduate of University of Toronto, Faculty of Applied Science, at present employed as instrumentman with the Surveys Branch of the Federal Government, is desirous of obtaining a position on a municipal engineering staff. Apply Box No. 104.

Civil Engineer

Engineer, Jr.E.I.C., desires position on the engineering staff of a municipality or with contractors. Ex-

perienced in design and construction of sewers, supervising construction of reinforced concrete work, pavements, surveys. Excellent draughtsman, expert on quantities. Salary $160.00 to $180.00 per month. Apply Box. No.106.

Situations Vacant

Engineer with knowledge of Portugese

Contracting company requires the services of a competent engineer having a knowledge of the Portugese language. Apply Box 216.

Mining Inspector

A mining Inspector for the Provinces of Alberta and Saskatchewan, Department of the Interior, with headquarters at Calgary, Alta., at an initial salary of $2,100 per annum, which will be increased upon recommendation for efficient service at the rate of $120 per annum until a maximum of $2,580 has been reached. This initial salary will be supplemented by whatever bonus may be provided by the law.

Duties.—To inspect mining operations under the direction of the Mining Engineer in order to determine the amount of royalties to be paid the Government; to consult with mine managers with a view of securing a maximum recovery of coal and of determining whether proper conservation measures are in use; to make underground and surface surveys of coal mines; to compute the quantity of coal mined at regular intervals; to make special investigations and reports regarding the development of natural resources; to see that the mining regulations are strictly complied with and to perform other related work as assigned.

Qualifications.—Education equivalent to high school graduation, either graduation in engineering from a recognized school of applied science with three years' experience in the practical development and operation of coal mines, or, the holder of a first class certificate of competency with five years' additional experience in the practical development and operation of coal mines; thorough familiarity with Departmental Mining regulations; knowledge of the theory and practice of coal mining and of the Dominion Land System of Surveys; ability to make investigations and prepare reports; good judgment, firmness and tact. While a definite age limit has not been fixed, age may be a determining factor when making a selection.

Application forms properly filled in must be filed in the office of the Civil Service Commission not later than July 13. Application forms may be obtained from the offices of the Employment Service of Canada, from the Postmasters at Prince Rupert, Vancouver, Victoria, Edmonton, Calgary, Regina, Winnipeg, Quebec, Charlottetown, Halifax, Fredericton, and St. John, or from the Secretary of the Civil Service Commission.

By order of the Commission.

W. FORAN,
Secretary.

Members' Exchange

Back Numbers of The Journal Wanted

The Librarian of the University of Cape Town wishes to secure the May, July and August numbers of The Engineering Journal of the year 1918, (Vol. 1, Nos. 1, 3 and 4) in order to complete the set for the University library. A request has also been received for a copy of *The Journal* of October 1920 (Vol. 3, No. 10). The Secretary will be pleased to receive these from any members who may have copies to spare.

ELECTIONS AND TRANSFERS

Elections and Transfers

At the meeting of Council held on June 27th, 1922, the following elections and transfers were effected:—

Members

Bladon, James Buckley, chief engineer, Darling Brothers Limited engrs. and mfrs., Montreal, Que.
Cartmel, William Bell, M.A. (Univ. of Nebraska), transmission engr., Northern Electric Co., Ltd., Montreal, Que.
Casey, William, vice president and genr. mgr., Canadian Locomotive Company, Kingston, Ont.
Gillis, Hugh Bernard, B.Sc. (McGill Univ.), supt. in chg. of ore mines and quarries dept., Dominion Iron & Steel Co., Sydney, N.S.
Wright, James Alpheus, chief engr., Parker Motor Car Co., Ltd., Montreal, Que.

Associate Members

Bishop, Willis D., designing and estimating engr., Northern Electric Co.. Ltd., Montreal, Que.
Bone, Allan Turner, B.Sc., (McGill Univ.) of Montreal, Que.
Clarke, John Leonard, B.Sc. (London Univ.), Bell Telephone Co. of Canada, Montreal, Que.
Cole, Donald, consulting engr., Detroit, Mich., U.S.A.
Davis, William Boyd, B.A.Sc. (Univ. of Toronto), in charge of construction at Lakefield Dam.
Donald, Alexander Stuart, res. engr., N.B. Electric Power Comm., Musquash, N.B.
Fraser, John Alfred, ventilation engr., and chief inspctr. on airway constrn., Dominion Coal Co., Glace Bay, N.S.
Nelson, James Barron, struct'l. designer and checker on super-structures for power houses, H.E.P.C., of Ont.
Paterson, Graham Ferguson, designer, sewer section, works dept., City of Toronto, Ont.
Reid, Brian Lee, res. engr., in charge of operation and constrn., Peace River Extension, Central Canada Rly.
Smith, Ernest, of Edmonds, B.C., engr., for the Corpn. of the district of Burnaby.
Spark, Harry S., asst. to G. E. Vogt, consltg. engr., Baltimore, U.S.A.

Juniors

Barlow, Arthur, mining engr's. dept., Dominion Coal Co., Glace Bay, N.S.
Gates, Grant Gordon, of Hamilton, Ont.
Hobart, George Maxwell, B.Sc., (McGill Univ.), industrial and chemical engr., Somerville Paper Boxes, Limited, London, Ont.
MacKay, Clarence, dftsman., Dominion Iron & Steel Co., Sydney, N.S.
Wimberley, Arthur Cecil, engr'g. clerk, irrig. branch, Dept. of the Interior, Ottawa, Ont.

Transferred from the class of Associate Member to that of Member

Kerr, Adam Thomas, divn. engr., Board of Railway Commission for Canada, Calgary, Alta.
Rannie, John Leslie, B.A.Sc., (Univ. of Toronto), D.L.S., D.T.S., supervisor of triangulation for Geodetic Survey of Canada, Ottawa Ont.
Seibert, Frederick Victor, B.A.Sc. (Univ. of Toronto), O.L.S., D.L.S., A.L.S., S.L.S., of Ottawa, Ont.

Transferred from the class of Junior to that of Associate Member

Milot, Camille, B.A.Sc., (C.E. Laval Univ.), Dept. Public Works and Labour, Bridge Division, Quebec.
Smith, Ernest E., B.A.Sc. (Univ. of Toronto), chief asst. to R. W. Code, Windsor, Ont.

Transferred from the class of Student to that of Associate Member.

Chambers, Hugh Dalford, B.Sc. (McGill Univ.), of Montreal, mgr., Canadian Office, G. D. Peters & Co., Ltd., of London, England.
Desjardins, Olivier, B.A.Sc. (Ecole Polytechnique), civil engr., Quebec Provincial Govt. Dept., Public Works, Bridge Division, Quebec.
Downie, Ralph Waldo, B.A.Sc. (Univ. of Toronto), tester of building materials, Welland Ship Canal, Thorold, Ont.

BRANCH NEWS

Hamilton Branch

W. F. McLaren, M.E.I.C., Secretary-Treasurer.

The annual meeting of the Branch, was held at 12.15 p.m. Monday, 22nd May 1922, at the Arcade. After enjoying an excellent lunch the chairman, E. H. Darling, M.E.I.C., called upon the secretary to read his report, which read as follows:

During the year nine Branch meetings were held, besides this annual meeting, all of which were reported in the Branch news of *The Journal.* The speakers and subjects were as follows:—

Nov. 1st. H. Harriman,— "St. Lawrence Power".
" 24th. Brig.-Gen. C. H. Mitchell,— Annual dinner.
Dec. 16th, Prof. Peter Gillespie, M.E.I.C., "Sir. Sanford Fleming".
Jan. 13th, Prof. C. R. Young, M.E.I.C., "Detroit-Windsor Bridge".
" 27th, T. H. Hogg, M.E.I.C., "St. Lawrence Power".
Feb. 16th, R. J. Durley, M.E.I.C., "Standardization".
Mar. 3rd, F. H. Farmer, M.E.I.C., "Installing Electric Apparatus".
" 24th, J. F. Peters — "220,000 Volt Transmission".
May 16th, Fryer & Darling — Architects Lunch.

The average attendance at these meetings was 85. Our executive committee held nine meetings, with an average attendance of four out of nine members. The following table shows changes of membership during the year:

Class	June 1, 1921	Resigned or transferred	New Members Joined	New Members Transferred	Total May, 31st, 1922
Members	17	0	0	3	20
Assoc. Members	54	8	2	12	60
Juniors	7	1	0	4	10
Students	29	5	0	3	27
Affiliates	55	8	7	0	54
Totals	162	22	9	22	171

There are many affiliates who are engineers and it is much to be regretted that they do not see fit to become corporate members. There is an opportunity for every member to become a canvasser.

Messrs Ford and Hubbard were elected auditors. The financial statement showed:

Receipts	$402.12
Expenses	344.54
Excess receipts	57.58
Last year's balance	144.80
Balance in bank	$202.38

The scrutineers' report showed the following elected as next year's executive:—Honorary Chairman, H. U. Hart, M.E.I.C.; Chairman, F. W. Paulin, A.M.E.I.C.; Vice-Chairman, J. W. Tyrrell, M.E.I.C.; Secretary-Treasurer, W. F. McLaren, M.E.I.C.; Executive Committee, H. G. Bertram, M.E.I.C., (1 year); P. M. Smith, M.E.I.C., (1 year); J. J. Mackay, M.E.I.C., (2 years); C. H. Marrs, M.E.I.C., (2 years); Past Chairman, E. H. Darling, M.E.I.C.; Councillor, E. R. Gray, A.M.E.I.C.

The proposed amendments to by-laws failed to carry, due to lacking a two-thirds majority for either.

The retiring chairman, E. H. Darling, M.E.I.C., then reviewed the year's work referring to the joint meetings held with the Chamber of Commerce and the Architects. The city had on two occasions asked the co-operation of the engineers. In closing, he urged all engineers to become members, as an organization could obtain results where an individual was helpless. The new chairman, F. W. Paulin, A.M.E.I.C., was then called upon. In speaking of the value of *The Engineering Institute* to the profession, he pointed out that he had quite frequently been asked to name an engineer for some particular undertaking but was often unable to do so, through not knowing of an available man. *The Institute* helps us to know each other. Mr. Gray moved a vote of thanks to the retiring executive, to which the secretary responded. The meeting then adjourned.

Peterborough Branch

R. C. Flitton, A.M.E.I.C., Secretary.

Visit to Hydro-Electric Power Station at Ranney Falls, Campbellford, Ont.

On June 3rd about forty-five members and guests from the Peterborough Branch proceeded by motor to Campbellford, Ont., where an inspection was made of the Hydro-Electric Power Commission's new 10,000-h.p. development at Ranney falls. It was a unique opportunity to see the entire plant and the visitors were shown all the interesting features from the roof of the power-house to the bottom of the tail-race. This plant is the largest work which the commission has on hand at the present time, with the exception of the Queenstown-Chippawa development. All who were fortunate enough to participate in this inspection were unanimous in their expressions as to the high standard of workmanship which had been maintained throughout.

After the inspection of the plant had been made the engineers congregated at the Windsor Hotel where they were the guests of the Hydro Commission at a somptuous repast. L. G. Ireland, chief municipal engineer for the Commission, who presided at the table expressed the pleasure of the Hydro at having the party visit the plant, pointing out that they had picked an opportune time, as in a few weeks the water would likely be let in.

A vote of thanks to the Hydro was moved by P. P. Westbye, M.E.I.C., chairman of the Peterborough Branch and was seconded by R. Hicks, chairman of the Peterborough Utilities Commission. The guests were welcomed to Campbellford by Mayor A. J. Meyers, who also spoke of the excellence of the work which had been done at the Ranney Falls plant. Deputy Reeve Nelson Stone spoke along similar lines. Other speakers were A. E. Caddey, M.E.I.C., engineer of the Trent Valley canal at Campbellford; Leon Frazer, secretary of the Peterborough Chamber of Commerce; H. C. Don Carlos chief of operation of the Hydro; P. L. Allison, M.E.I.C., honorary chairman of the Peterborough Branch; F. H. Dobbin, Sr.; R. L. Dobbin, M.E.I.C., and G. B. Smith of Belleville,

superintendent of operation of the Central Ontario System of the Hydro.

During the programme the guests were entertained by Mr. Fred Woolnough of New York who gave some humourous stories. The function ended with three cheers for the Hydro and the singing of "Auld Lang Syne", and the party was soon on its way after having spent a very enjoyable and interesting time in Campbellford. The arrangements for the outing were in the capable hands of James Mackintosh, A.M.E.I.C., and E. R. Shirley, M.E.I.C., of Peterborough who were assisted by A. E. Caddy, M.E.I.C., of Campbellford, G. B. Smith of Belleville, Fred A. Burgar, A.M.E.I.C., superintendent of construction and A. L. Malcolm, A.M.E.I.C.

Peterborough Branch visits Campbellford, Ont., and inspects Hydro-Electric Power Commissions' Ranney Falls Development

Border Cities Branch

J. Clark Keith, A.M.E.I.C., Secretary-Treasurer.

The regular May meeting of the Border Cities Branch was held in the Windsor Collegiate on May 19th when Colonel Boyden of the Portland Cement Association addressed an open meeting.

There was a small attendance due to counter attractions for many members on that evening. Those present heard a very instructive address and it was unfortunate that many more were not present. The lecture was illustrated by slides and those who desired a copy of the subject matter of the address received it upon request.

The common conception of concrete is that we can take cement sand, stone and water and put concrete making ability into them. The development of concrete until recent years was very much without laboratory research due to lack of funds and such research dealt with reinforced concrete more than with actual mixtures. One billion dollars worth of concrete in United States last year might have affected a saving of 25 per cent if fundamental laws had been understood. Because of this lack of knowledge, a laboratory was established in 1914 at the Lewis Institute by the Portland Cement Association, representing 95 per cent of the cement manufacturers of America. In this laboratory, 75,000 tests are made annually. The first report was made by Professor Duff Abrams after five years work, the facts established being proven by thousands of tests. These tests covered: (1) Study of characteristics of ingredients; (2) Study of combination of ingredients; (3) Study of manipulation of concrete.

There are just three ingredients to be considered — cement, aggregate and water. All cement is made to a minimum specification and must pass the standards of the American Society of Testing Materials in order that the manufacturer may be admitted to membership in the Portland Cement Association. Sand must be clean, hard and not too fine. Rounded particles find their way more readily into open spaces than sharp particles and require less water to produce a given result. It must be clean — 1/1000 part of organic impurity reduces the strength of the mixture 25 per cent and impurities are hard to wash out. Fine sands produce the same results as coarse sands. In coarse aggregates, the hardness is secondary in abrasion. Light aggregates give high abrasive qualities dependent upon the relative quantity of the mixing water. Water content is equally as important as cement. The physical qualities of water, excepting alkaline or saline elements have little effect upon concrete unless humus is contained. The temperature of the water between freezing and boiling has no effect on concrete. The water cement ratio is the most important factor in concrete, the proportioning by arbitrary volume is wrong, the lower the water-cement ratio, the stronger the mixture.

The strength of concrete is found to have a direct relation to the "fineness modulus" which is a function of the sieve analysis of the aggregate used for any particular concrete. As a practical application of the "fineness modulus" in order to be assured of quality in concrete, specifications are now drafted in which the finished product must have a definite compressive strength in twenty-eight days.

The slump test, mixing, and protection of concrete were covered in much detail and two conclusions were deduced as a result of laboratory research. (1) Each mixture should be designed to produce a concrete of a certain desired strength with the ingredients available. (2) The important features in the making of good concrete should be emphasized.

There was much useful discussion at the close of Colonel Boyden's address, almost everyone in the hall being interested in some particular phase of concrete construction.

Ottawa Branch

F. C. C. Lynch, Associate E.I.C., Secretary-Treasurer.

Accuracy in the mixing of cement is absolutely essential, if satisfactory results are to be obtained, according to Col. H. L. Boyden, special engineer of the Portland Cement Association. Col. Boyden was speaking before the Ottawa Branch, at the University Club, and gave to the large number of engineers present much valuable information on the modern uses of cement and the results of experiments under varying conditions. He strongly advised engineers to carefully study the various requirements of specifications and, instead of specifying proportions of ingredients, to require results from contractors and builders. In this way much less trouble would be encountered and more satisfactory work would be produced. Col. Boyden said that far too much importance is attached to the quality of stone used, stating that often, owing to precedent, a certain kind of stone is specified, which has to be brought to the work at heavy cost, while a local stone is often available. Correct proportions of cement and water are the chief requirements.

The Hudson Bay Railway

Engineers will be interested in the discussion on the Hudson Bay railway which took place in the House of Commons on Saturday, June 10th. In reply to enquiries Hon. Mr. Kennedy, Minister of Railways, replied that the government would shortly make an announcement regarding the Board of Directors of the Canadian National Railways, and that the question of the completion of the Hudson Bay railway would be referred to the new board. It was stated that the road up to the present had cost about $20,000,000, and that it would take about $5,000,000 more to complete the railway and $10,000,000 for the terminals.

Interest in proposed Graduate School.

Ottawa engineers are greatly interested in the proposals for a graduate school advanced by Dr. F. D. Adams, Hon. M.E.I.C., at the inter-university congress recently held in Winnipeg. There is great need for a more effective co-operation between Canadian universities in furnishing facilities for graduate work. Especially is this so in engineering and cognate science. The suggestion of Dr. R. W. Brock, Dean of the Engineering Faculty at the University of British Columbia, that Canadian univer-

sities immediately pool their facilities to establish a graduate school at Ottawa, the capital of the Dominion, offers a very happy and satisfactory solution to the general problem.

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

The report of the Executive committee, as presented at the annual meeting of the Branch, was published in last month's news and in it were outlined the activities during the past year. At the same meeting the retiring chairman, J. D. McBeath, M.E.I.C., reviewed the progress of the Branch as follows:

Retiring President's Address

Gentlemen:

As this is the last meeting at which it will be my pleasure to act as your chairman, a short review of our activities during the year 1921-22, with a few impressions and suggestions, will probably not be misplaced.

The Branch started the year with a total membership of 44 which has since increased to 66, a gain of 50 per cent.

We might be pardoned in saying that we are proud of this showing, especially when several of the other Branches have not shown a very large percentage of increase.

Meetings at Sackville

I am of the opinion that the holding of two meetings at Sackville with the Engineering Society of Mount Allison University has resulted in a benefit to all concerned, and its continuation is recommended to the executive for next year.

Papers

Some very excellent papers were submitted during the past year, a detailed statement of which appears in the report of the secretary. I consider we are indebted to the chairman of the Papers committee for his energy and hard work during the time this office was entrusted to him. I would suggest that the papers in the future be made as interesting and practical as possible, giving more attention to local engineering questions and constructive work. It would appear that papers of this nature would be more satisfactory than more theoretical ones.

Policy

Your chairman is strongly of the opinion that this Branch should take a decided step and make definite recommendations to the parties concerned in local public engineering questions. For example, I believe they should submit to the public well defined recommendations on the hydro-electric question, both from a development and distribution standpoint; recommendations should be made on the conservation of natural gas; on the elimination of wooden poles from our main thoroughfares; on the elimination of grade crossings; on the establishment of parks and playgrounds, and on street illumination, etc. These are questions which affect us not only as citizens but as engineers, and our fellow citizens should have the benefit of the training of the engineer to help them solve these public questions. Special committees from our organization might be appointed to consider each one of these subjects. It is only in this way that the full worth of the engineer will be realized and the profession occupy the place which it deserves.

Meetings

The policy adopted of having one of our monthly meetings take the form of a supper meeting is a good one and I think should be continued. It may be said without contradiction that we have without exception enjoyed our meetings during the year. Not only have we been benefited from an engineering standpoint, but we have learned to know one another better and have come to recognize the peculiar problems with which each one is confronted.

Co-Operation

In conclusion I wish to thank the secretary and all other officers and members for their very hearty co-operation during the year, and if each one realizes that our organization is just what we ourselves make it and does everything in his power to promote its interests, I am sure that the Moncton Branch of *The Engineering Institute of Canada* will not only be an invaluable organization in the community but will be one of the best Branches in Canada. I trust that you will give to the officers for 1922-23 the same support as you have given to the officers for 1921-22.

J. D. McBeath,
Chairman, Moncton Branch, E.I.C.

Election of Officers

The scrutineers, A. E. Oulton, Jr.E.I.C., and H. F. Finnemore, A.M.E.I.C., announced the following officers elected for the ensuing year,—Chairman, F. B. Tapley, M.E.I.C., engineer of maintenance, Canadian National Rlys.; Vice-Chairman, F. B. Fripp, A.M.E.I.C., harbour engineer, C.N.R.; Secretary-Treasurer, M. J. Murphy, A.M.E.I.C., asst. engineer, C.N.R.; Executive Committee,—G. C. Torrens, A.M.E.I.C., division engineer, C.N.R., C. S. G. Rogers, A.M.E.I.C., asst. engineer of bridges, C.N.R., A. S. Gunn, A.M.E.I.C., asst. engineer, C.N.R., J. G. Dryden, A.M.E.I.C., asst. engineer, C.N.R., Prof. McKiel, A.M.E.I.C., Mount Allison University, K. Gordon, A.M.E.I.C., asst. engineer, C.N.R., A. F. Stewart, M.E.I.C., chief engineer, C.N.R., (Ex-Officio), J. D. McBeath, M.E.I.C., city engineer, Moncton (Ex-Officio).

The chairman called on the newly elected officers for a few remarks, Messrs. Gunn, Rogers, and Gordon responded with a few well chosen remarks thanking the members of Moncton Branch for the confidence shown in electing them to the several offices and assured the members present that they would do everything in their power to promote the good work and welfare of *The Institute* in general and the Moncton Branch in particular, during the coming year.

A vote of thanks was tendered the retiring chairman and vice-chairman, J. D. McBeath, M.E.I.C., and S. B. Wass, A.M.E.I.C., with congratulations on the success attained during their term of office.

Vancouver Branch

P. H. Buchan, A.M.E.I.C., Secretary-Treasurer.

Paper on the Gas Industry.

On Tuesday evening, May 9th, a general meeting of the Vancouver Branch was held in the Board of Trade building for the purpose of hearing an address by John Keillor, gas engineer of the Vancouver Gas Company on the "History and Development of the Gas Industry". A large number of lantern slides were shown, which very clearly illustrated the important steps in the advancement of the manufacture of coal gas, since the first practical attempt at gas-lighting in 1797, by that indefatigable experimenter James Murdoch, who succeeded in illuminating his house and office at Old Cumnock, Ayrshire, Scotland, with gas distilled from coal in an iron retort.

The first gas mains in a public street were the lead pipes laid in Pall Mall in December 1806, and the first gas-lighting of public streets occurred on January 28th, 1807. In 1810, the first company was incorporated by the British Parliament for the manufacture and sale of gas and coke, known as the London and Westminster Gas Light and Coke Company. The gas meter was invented by Clegg in 1815, but was not adopted by this company until 1840. Broadmeadow patented the exhauster in 1824 and in 1825, Samuel Crossby invented the gas governor. The first gas lighting in the United States occurred in Baltimore in 1816, and the first in Canada was in Montreal in 1840.

Mr. Keillor dwelt at some length on the early experiments, the first being conducted by James Murdoch in an old teapot. He made many references to the popular disapproval of the invention, a good illustration of which may be joined in the following lines which were current in Glasgow during that period:

"We thankful are that sun and moon,
Were placed so very high,
That no tempestuous hand might reach,
To tear them from the sky.
Were it not so, we soon should find
That some reforming ass,
Would straight propose to snuff them out,
And light the world with "GAS".

After outlining the history of the industry, Mr. Keillor exhibited numerous slides illustrating the various steps in the improvement of retorts, purifiers, coking plants, etc. He dealt with the problems involved in the saving of by-products, which were formerly lost, and illustrated the newest departuie in England, where it is now legal to completely gasify coal, leaving practically no coke or other by-products.

The Vancouver Branch invited the Canadian Pacific Section of the Society of Chemical Industry to the meeting to hear this most interesting paper. We believe that the practice of extending such courtesies to other organizations, when opportunities arise, will enhance the usefulness of *The Institute* in a way which is both a pleasure to ourselves and a benefit to our friends.

Association of Professional Engineers' Notes.

At a Council meeting of the Association of Professional Engineers of B.C. held on Saturday night, May 13th, a suggestion was received from various members to the effect that on account of the constitution only calling for one meeting a year, many members feel that the moment the meeting is over they have no further interest in the Association for another period of twelve months. They suggested that in connection with other bodies a monthly or two-monthly luncheon would serve the double purpose, of being able to discuss Association matters or engineering works of interest, and perhaps socially to create an opportunity of meeting brother engineers. It was therefore decided that the secretary of the Association should arrange the first luncheon, which it is hoped will be held towards the end of this month, and that thereafter a committee of members will take care of this activity in order that these luncheons may become a permanent function.

Information has been received that the Board of Examiners of the Association of Professional Engineers is drawing up the syllabus for the forthcoming examinations and it is hoped that shortly the syllabus in full will be available to those desiring entrance by examination. Mr. Bertram Chase Footner of Wallachin, B.C., and William Lloyd Affleck, B.C.L.S., of Nelson, B.C., were admitted to membership in the Association by examination of the credentials.

The registrar is in receipt of a letter from C. R. Crysdale, M.E.I.C., addressed from the Gold Coast Harbours, Seccondee Gold Coast, British West Africa, of April 7th in which Mr. Crysdale acknowledges the receipt of the minutes of the general meeting of the Association and indicates his pleasure at the successful work accomplished by the Association. He states that his work up to date has been most interesting, instructive and enjoyable and he hopes in the near future to send us some information and particulars regarding the same.

Calgary Branch

J. A. Spreckley, A.M.E.I.C., Secretary.
Floyd K. Beach, A.M.E.I.C., Branch News-Editor.

On June 5th, Professor Duff A. Abrams, M.E.I.C., M. Am. Soc. C.E., Professor in charge Structural Materials Research Laboratory, Lewis Institute, Chicago, addressed the Calgary Branch, on improved methods of designing and making concrete. The public were invited to attend the meeting and a large turnout of *Institute* members and of contractors and others interested in concrete listened with great interest to the lecture. As he is giving the same talk to other branches, and is supplying his manuscript for publication in full in *The Journal*, a summary is not given here, but the discussion is of interest generally.

The question was raised as to whether any steps are being taken to draw up specifications which can be used in the place of the old 1: 2: 4 or similar ratio clauses. The inquirer felt that if ratio clauses are to be dropped, some other form of specification must be substituted. Professor Abrams was not inclined to commit himself as to the desirability of long drawn specifications. He pointed out that aggregates differ so widely in different localities that specifications drawn for one locality or job might be very undesirable elsewhere, and suggested that the farthest a general specification could go, would be to fix certain compressive strengths for finished concrete. Beyond this it was implied that the specifications must be drawn to fit local conditions and the requirements of the job, and great dependence placed on the inspection and testing of the work as it proceeded.

The committee of *The Institute* investigating the effect of alkali on concrete was in session in Calgary during the day and they were present at the lecture. As their deliberations were not complete, various questions by interested engineers, leading to the solution of alkali difficulties, were left unanswered by the speaker. Questions as to the effect of low temperatures on fresh concrete and methods of securing good concrete poured under low temperature conditions were left without much discussion, as they did not come under the immediate research of Professor Abrams.

After the discussion a number of visiting engineers were called on for brief remarks. Among the visitors who were welcomed were:—Fraser S. Keith, M.E.I.C.; C. J. Mackenzie, M.E.I.C.; G. M. Williams, A.M.E.I.C.; W. P. Brereton, M.E.I.C.; J. N. Finlayson, M.E.I.C., W. McI. Weir; R. S. Stockton, M.E.I.C.; A. W. Haddow, A.M.E.I.C.; Dr. J. W. Shipley; T. Thorvaldson; A. G. Blackie; J. A. Kelso; A. Griffin; C. M. Arnold, M.E.I.C.; S. G. Porter, M.E.I.C.; and H. B. Muckleston, M.E.I.C.

Publicity Work in Alberta.

The work of the Publicity Committee of the Alberta Association of Professional Engineers is worthy of note by engineers in other parts of the Dominion. It is easy to say that the engineer should enter more fully into the life of the community and keep the public in touch with what he is doing. It is quite a different matter to achieve this. Many engineers are engaged in work for clients who may not wish their private affairs made public. Others are in the employ of corporations government departments and are not at liberty to make their work public, except through formal reports published by their respective departments. For these and other reasons it is only by great effort that any news of current engineering work finds its way to the press direct from the engineer. It is, therefore, felt that considerable credit is due to Major Frank Emery, A.M.E.I.C., chairman of the Publicity Committee of the Alberta Association. Due to his efforts, a series of articles readable by the general public, have been appearing in the Calgary Herald. Each "story" has appeared under the name of the particular writer as *Member of Alberta Association of Professional Engineers*, and somewhere in the article, the point is made that the public is protected where a professional engineer is responsible for the kind of work described. In addition, editorials have appeared in the local press, commenting favourably on the appointment of professional engineers to certain provincial government posts.

Presentation to the Past Branch Secretary-Treasurer.

At a general meeting of the Branch, held on Friday April 28th, A. L. Ford, M.E.I.C., past secretary-treasurer, was presented with a silver wrist watch in appreciation of his services in that office. The presentation was made by P. J. Jennings, M.E.I.C., chairman, who spoke of the excellent condition of the Branch, both financially and in membership during Mr. Ford's tenure of office.

Saskatchewan Branch

D. A. R. McCannel, A.M.E.I.C., Secretary-Treasurer.

On June 14th a meeting of the Papers and Library Committee was held to prepare plans for the fall and winter meetings. It was decided to recommend that two meetings a month be held commencing in October. The selection of subjects for papers was then considered. This was facilitated by the action of the convenor, Lieut.-Col. A. C. Garner, M.E.I.C., who some weeks ago had S. R. Parker, A.M.E.I.C., submit to him a list of subjects, (thirty-six in number), which were sent out to each member of the committee with a request for written comments and suggestions. These replies were gone over first and the list was then boiled down to seventeen which were considered to be of special interest to the members. It is the intention of the committee, as soon as contributors for the proposed papers are definitely secured, to have the completed programme printed and forwarded to every member of the Branch.

Plans were also formulated for the summer meeting to be held in Moose Jaw on July 14th. J. D. Peters, A.M.E.I.C., the Moose Jaw member of our committee was present and gave assurance of hearty co-operation from the members residing in his city to make this meeting a valuable one.

Halifax

O. S. Cox, A.M.E.I.C., Secretary-Treasurer.

At a special meeting of the Halifax Branch held on May 10th, Col. H. C. Boyden delivered an address on the above subject. The meeting was called to order at 8.15 p.m. and the Chairman introduced the speaker as one eminently fitted to deal with the subject, owing to his long practical experience in the use of concrete and to his connection with the Research Department of the Portland Cement Association.

Annual Meeting of the Branch

The annual meeting of the Branch was held in the Green Lantern on May 30th, 1922, at 6.15 p.m., chairman C. E. W. Dodwell, M.E.I.C., presiding. The minutes of the previous annual meeting were read and approved. The report of the secretary-treasurer for the Branch year was then read as follows:—

Secretary-Treasurer's Report for 1921-22

Mr. Chairman and members of the Halifax Branch.—

During the year 1921-22 the Branch has held nine meetings, as follows:—

Annual Meeting of Branch, May 17th, 1921, at which the regular business was transacted and the officers for the year elected. Attendance, 27.

October 20th—Address by Prof. F. H. Sexton who gave an account of his trip overseas, with special reference to reconstruction in France. Attendance, 46.

Nov. 18th— Paper by I. P. Macnab, M.E.I.C., on "General Tramway Engineering." Attendance, 42.

Dec. 19th—Paper by H. W. Johnson on "Town Planning". Attendance, 42.

Jan. 17th—Paper on "Problems encountered in Local Building Construction" by C. St. J. Wilson, A.M.E.I.C. Attendance, 46.

Feb. 16th—Paper by K. L. Dawson, A.M.E.I.C., on "A Lump of Coal". Attendance, 30.
March 29th—Paper by W. G. Hardy, A.M.E.I.C., on "Engineering underground in France." Attendance, 35.
April 26th—Paper by H. B. Pickings, A.M.E.I.C., on "Some Problems met in surveying."
May 10th—Special meeting at which an address was given by Col. H. C. Boyden on "Recent Development in Concrete."

The membership of the Branch is as follows:—

Members	26
Assoc. Members	46
Juniors	16
Students	12
Br. Affiliates	5
Total	105

This is a loss of ten from last year's total when there were 115 members. The majority of these losses have been occasioned by the removal of members from within the jurisdiction of the Branch.

Receipts		
Rebates from Head Office and Branch News	$309.94	
Fees from Branch Affiliates	25.00	
Bank Interest	4.62	
Balance on hand May 17th, 1921	91.07	
		$430.63
Disbursements		
Clerical help	$60.00	
Stamps and Post Cards	26.66	
Journal Subs. for Br. Affiliates	6.00	
Entertainment of Guests	2.60	
Telegrams	.91	
Printing	18.35	
Expenses of Meetings	4.00	
Expressage	3.20	
Expenses Secty's meeting at Montreal	45.00	
Honorarium to Secty's	50.00	$216.72
Balance on hand		$213.91

The adoption of this report was carried on motion of F. A. Bowman and L. H. Wheaton. The report of the scrutineers was then read and the following declared elected as Branch officers for the ensuing year:—Chairman, F. R. Faulkner, M.E.I.C.; Secty-Treas., O. S.Cox, A.M.E.I.C., Exec. Committee, I. P. Macnab, M.E.I.C., C. A. Fowler, A.M.E.I.C., A. F. Dyer, A.M.E.I.C., K. H. Smith, M.E.I.C.

The retiring chairman then gave his valedictory address as follows:—

Address of Retiring President

In handing over the chairmanship of the Branch to my successor, I wish to thank you very warmly, and to express my high appreciation of the honour that you did me a year ago in giving me a second term in this honourable position.

I wish also to extend my most cordial thanks to the other members of the Executive Committee to whose active interest and hearty co-operation and assistance in every feature of our activities the successful work of the Branch during the past year is due; to the secretary especially my thanks are tendered for his unremitting zeal and thoroughly efficient services.

Let me now congratulate the members of the Branch on their selection of a chairman for the coming year. Being a younger and more vigorous man than his predecessor, I may safely predict, and express the confident hope, that the coming year will be a better and a more successful one than the past in everything that makes for the usefulness of the Branch and the interests of its every member.

In casting about for a specific subject for my valedictory address it occurred to me that it would not be uninteresting, and possibly not wholly uninstructive, to give you a sort of bird's eye survey of the profession as a whole with its various and numerous branches, specialties and ramifications.

First, let me say a word about that much abused and wrongly used adjective, "Civil", as applied to the Engineer. It came into general acceptation about the middle of the eighteenth century, its obvious use being to distinguish an engineer who is not a military engineer, and who conducted works of a non-military character. At or prior to that time the term engineer connoted either a military engineer, whose works embraced the design and construction of fortifications and their concomitants, besides weapons of offense and defence. Many works, however, now carried on by the "civil" engineer were done by the military engineer, such as roads, canals and bridges. The adjective civil was also applied to the engineer who designed and built engines and machinery of various kinds. He is now called a "mechanical" engineer. It is obvious that at the time of the foundation of the Institution of Civil Engineers of London in 1818, the activities of civil engineers embraced the construction of practically every engineering work that was not of a military character, for the charter of the Institution, (dated 1828), defines the aims and functions of the civil engineer as "...the art of directing the great sources of power in nature for the use and convenience of man, as the means of production and of traffic in states, both for external and internal trade, as applied in the construction of roads, bridges, aqueducts, canals, river navigation and docks for internal intercourse and exchange, and in the construction of ports, harbours, moles, breakwaters and light-houses,

F. R. FAULKNER, M.E.I.C.
Chairman of the Halifax Branch.

and in the art of navigation by artificial power for the purposes of commerce, and in the construction and adaptation of machinery, and in the drainage of cities and towns." Thus embracing the works of the mechanical, naval and marine, besides those of what we call the civil engineer.

Curious evidence of the fact that several centuries ago the word engineer meant a military engineer is afforded by Shakespeare:—

" Let it Work
For 'tis the sport to have the Engineer
Hoist with his own petard; and it shall go hard
But I will delve one yard below their mines
And blow them at the moon.
Shakespeare, Hamlet 111, 4"

I wish we could discover or invent a new adjective that would supersede the word "civil" in its application to the engineer, but as this seems hopeless, I suppose we must accept and continue the use of the word as now generally applied.

The whole domain of our profession then is divided into numerous fields to which we give the broad and comprehensive names, civil, mechanical, mining, electrical, military and naval. These fields again are divided into still smaller fields or garden plots. Indeed, it is not easy to define or to limit the specialization and "splitifications" into which the profession is cut up in these modern days. Agreeing perforce to the popularly accepted meaning, the civil engineer is one who is engaged in the design and construction of —

(a) Transportation routes, such as railways, tramways, highways, canals, bridges and tunnels.

(b) Harbours and all their accompaniments, wet docks, and dry docks, wharves, piers, breakwaters, beach protection works, levees, groynes, training weirs and moles for the control and improvement of rivers, whether in the interests of navigation, or the prevention or mitigation of floods.

(c) Systems of water supply and the drainage and sewerage of cities anf towns. Irrigation works.

(d) The development of hydraulic power with all its accessories, such as dams, flumes, conduits, turbines and power wheels of a dozen kinds.

So you see the civil engineer may devote his whole time, energy and skill to any one of a score of specialties each demanding special knowledge, skill and training.

The field of the mechanical engineer is scarcely less wide, his work is the design and construction of machines and machinery of infinite kinds, uses and purposes throughout the whole industrial world, from the ponderous machines that cut and bend, punch and forge the plates and shapes in a rail or rolling mill or shipyard, to the amazingly ingenious and delicate implements that turn out those exquisite fabrics of silks and satins that adorn the so-called weaker sex. One of the most interesting specialities of the mechanical engineer, and one in which he no doubt takes a peculiar pride and pleasure, is the design and construction of airships. Twenty years ago these were scientific freaks or toys, now practical and commercial modes of transport of which it is hard to underestimate the potentialities.

The mining engineer labours in a basement rather than a field. His it is to find and bring to the surface of the earth the treasures hidden below it, the ores, minerals and metaliferous rocks that provide us with a score or two different metals, metallic and metalloid substances, the coal to smelt them and incidentally to fill our furnaces and the coffers of our coal dealer. The successful exploration of his field or basement requires a knowledge of several subjects that are not engineering. He must have a fairly thorough grasp of geology, mineralogy and metallurgy, with at least a smattering of inorganic chemistry and chemical analysis for the identification of metals.

The electrical engineer is a late arrival in the professional arena, but he is getting more important every day. To him we look to produce and deliver the electric current that lights us to bed and which, in the advanced household, cooks our eggs or rasher, makes our toast and boils our coffee in the morning, that irons our shirt and drives our sewing machine, that puts us into instant communication with distant friends and enemies by telephone or telegraph.

On a larger scale and aided by the mechanical engineer he delivers the energy that drives the dynamo that operates the tram that takes us to our office. The electric locomotive, scoffed at in the earlier stages of its development, has come to stay and to multiply. It has solved the difficulty that was rapidly becoming a very serious one, of the smoke and heat in subways, underground railways and tunnels.

I think that now-a-days the field of the electric engineer is almost, if not quite, the largest and most interesting and important in the whole domain of the profession. He has not yet even seen the half of it. Indeed, he may be said to have only just got through the gate. What he will discover and invent, and what he will find to exploit and adapt, when he has explored the further limits of his wonderful specialty, and how and in what ways he will revolutionize many phases of our complex civilization, it simply staggers the imagination to attempt to conceive. The electrical engineer in his constructive activities, and in his applications and adaptations of further wonders and properties of that mysterious something which we call electricity, must follow and wait on the researches and discoveries of the pure scientists, physicists, and electricians. The most astounding of recent marvels in the line of electricity, but due rather to the scientist than to the engineer, is no doubt radio-activity and its development in wireless telegraphy and telephony. In this feature discovery follows discovery in bewildering sequence and frequence. Where will it stop, or rather whither will it lead? For it certainly will not stop. The latest theory of the physicist is that all force and matter are, in the last analysis, mere expressions of electricity.

The military engineer made good his claim to a conspicuous place in the sun during the great war, for during those four awful years he won *kudos* beyond all his former achievements. His special work in the design and construction of fortifications and of engines of destruction was extended to the digging of mines, of trenches and tunnels, the former for defence or shelter and the latter for operations of offense in the laying of mines of high explosives for the discomfiture of the noisome Hun. For many years the engineers of the British army were

called "sappers and miners", because their chief offensive operations in time of war were the sapping and mining of the ennemies' positions. In collaboration with the mechanical engineer he invented and developed the tank, which like some fabled dragon, paralysed the enemy and created such havoc and panic in his ranks. Of it the modern Horace sang:—

> "Victrix per Campos Cisterna vagatur et ecce!
> Viventes pilulos capsula capta vomit."

which may be rendered:—

> "The tank triumphant wanders o'er the fields
> And living pills the captured capsule yields."

Urged by necessity also, the mechanical and the military engineer wonderfully advanced the offense-proficiency of the aeroplane or "dove" as it was playfully called by our friends, the enemey. The general public has but scant knowledge of the tremendously important and valuable part that was played by the military engineer during the war. Our Branch learned something of this from an excellent paper by R. R. Murray, A.M.E.I.C., read at one of our meetings. Among the most important duties of military engineers in peace time is the cadastral, or ordnance, survey of Great Britain, a work of great interest and importance.

The naval or marine engineer, is cousin or half brother to the mechanical engineer. His special and most important job is, of course, the design of engines for the propulsion of vessels afloat, and when you review the progress that he has made since the first steamer of less than 1,000 tons crossed the Atlantic eighty years ago at eight knots, to the present day when "Aquitanias" and "Olympics" of thirty thousand tons do it at twenty-five knots, you will agree that the naval engineer has not lagged behind in the march of professional achievement. The naval engineer also, with the aid of the mechanical and military, has to do with the design of naval artillery and in this specialty remarkable development is seen from the old smooth bore of Nelson's day, that cumbrous, manhandled piece that threw a sixty-four pound round shot nearly a mile, to the fourteen- sixteen- and even eighteen-inch breech loading rifle that projects a high explosive shell weighing nearly a ton for twenty-five to thirty miles. But the naval engineer has other lines of activity besides his propulsive engines and his big guns. The modern Leviathan is full of machinery and mechanical devices, not only in the heating and lighting for the comfort and convenience of the passengers, but for the stowage and handling of cargo, the raising and lowering of anchors, and the warping to a berth. On the general design of the whole complex fabric and the ship the naval or marine engineer and the naval or marine architect and the electrical engineer or electrician are mutually dependent for the elaboration of the complete plan.

But each of the six main branches into which I have attempted crudely to divide our profession, has many sub-specialities, off-shoots or hybrids.

The municipal engineer looks after the comfort and convenience of the dwellers in cities and towns, by seeing that their contributions to the civic exchequer are wisely expended in the construction of streets and roadways, sidewalks and pavements, tracks and facilities for inter-urban traffic by tramways operated by electricity, cable, or the almost forgotten horse. With the aid of the electric engineer or electrician he sees to it that our streets and houses and public buildings are properly lighted; that an efficient system of water supply delivers an adequate quantity of oxide of hydrogen for domestic and manufacturing purposes, and for the extinguishing of fires, to reduce our fire premiums. He designs and builds sewers and drains for the rapid and thorough removal of all liquid residua and crematories and garbage incinerators for the reduction to innocuous ash of all solid refuse.

The chemical engineer is perhaps a more highly scientific man than many of his professional confreres. His interesting duty is, in conjunction with the chemist and the mechanical engineer, to design and build works and plant and machinery for the manufacture of the innumerable chemical substances and products that enter so largely not only into our industrial life, but also into other phases of our complex modern existence. His growing importance as a promoter of agricultural process is very strikingly shown by an electro-chemical industry that has sprung up within the past quarter of a century and which is of such scientific and commercial interest that it deserves at least a passing notice.

In 1892, Sir William Crooks showed that by passing a strong induction current between terminals, the air took fire under the intense heat of the electric arc and continued to burn with a powerful flame, producing nitrous and nitric acids. In his address to the British Association in 1898 he said, "This inconsiderable experiment may not unlikely lead to the development of a mighty industry destined to solve the great food problem." He was a prophet. A few years later the first successful nitrate factory was established at Notodden in Norway, on the banks of a powerful stream which actuated a battery of electric furnaces of 800 h.p. each. An alternating current of 3,000 to 5,000 volts is passed through the electrodes and a powerful electro-magnet blows the arc into a rotary disc of flame, six feet in diameter, consisting of burning nitrogen and oxygen. The resulting gases, which contain two-thirds of one percent of nitrous oxide, are pumped off, and through a further series of processes, there is formed calcium nitrate and nitrite, which can be used directly as fertilizer. Sir Wm. Crooks' experiment was an imitation of the lightning flash by which throughout the world more than four hundred million tons of nitrogen are yearly combined and washed into the surface of the earth by rain. In this way most of the combined nitrogen in the soil and in all living things has been obtained from the air.

The sanitary engineer has to do with the works and structures and appliances and mechanical devices that make for and safeguard the health of the community. The scientific disposition or treatment of sewage or refuse by converting it into something either useful or harmless, fertilizer, inert ash or sterilized effluent, by the use of sedimentation tanks, sludge compressors and driers or incinerating furnaces. He designs, on scientific principles, the whole elaborate system of plumbing for very large buildings of many kinds and uses.

The hydraulic engineer, as his adjective implies, has to do with running water, whether in rivers, aqueducts, flumes, conduits or pipes. His works, which, however, are for the most part carried on by the civil engineer, who rarely specializes himself by the title hydraulic, are the regulation and adjustment of the regimen of rivers and streams with a view to the improvement of navigation or the prevention of floods by means of dams, weirs or levees. He develops the power of falls and rapids by turbines and other wheels. To him we owe the evolution of the modern high efficiency unit of 75 to 80 percent with its ten to twelve thousand h.p. from the ancient, cumbrous, over- or undershot wheel with its 10 to 12 percent efficiency and twenty or thirty horse power.

The heating engineer and the ventilating engineer, generally and properly in one person, is a man of no little importance in the design and operation of large city edifices, such as hotels, office buildings, and theatres.

The steam engineer is a sub-specialist of the mechanical. He is supposed to design and operate engines driven by steam, with their attendant boilers; to study and experiment on their mutual relationships, to record diagrams and full and minute operative particulars with a view to the increased efficiency of the engine, using a given quantity and pressure of steam, and the minimum cost of fuel and attendance. It is in this line of mechanical activity that we often come across an improper use of the title engineer. The man who drives a locomotive or even a little 3 or 4 h.p. steam or gasoline engine, or he who looks after the furnaces in large buildings, is in popular parlance, an engineer. It is easier to draw the line between the engineer and the non-engineer — though this is often difficult — than it is to get the public to see it. I take it that the man who can design and build an engine, understand the scientific principles underlying its construction and operation, is an engineer, and the man who merely manages, operates or repairs it is a mechanic, machinist or mechanician.

The forest engineer's function is to provide one of the most indispensable materials, and his work and usefulness are coming into deserved recognition by the establishment in many countries of departments and bureaus of forestry, and of schools and colleges for the study of the best methods of preserving our forests and of stimulating tree growth in arid and other hitherto unsuitable soils and situations.

Thus we see that the many fields into which the whole profession is divided have no clearly defined boundaries or barbed wire fences separating each from the other. They all lap or interlock more or less, and are surrounded on all sides by strips or common margins of professional and technical activities where two or often several specialists meet for their mutual aid and advantage.

I have described at somewhat greater length than may have interested you the various leading types and classes of professional engineers and their respective and particular lines of work. I have done so because I think it important, or anyhow desirable, that at this juncture in the progress and status of our profession, we should have a clear idea, as to what an engineer is, and also as to what he is not.

The public has never had much trouble in distinguishing between doctors and laymen, or between lawyers and laymen, because for centuries their respective occupations have been clearly defined and universally recognized as learned professions. Before doctors and lawyers are admitted to practise they are compelled to pass through protracted and well defined courses of study, and they must produce certificates or diplomas of knowledge and proficiency. Once admitted they are protected by law from the rivalry of unqualified men. It is only within the past three or four years, after twenty odd years of effort, that we have won this last advantage. It may also be noted in this connection that you can make a doctor or a lawyer within the four walls of a building, but in the making of an engineer, after he has had four or five years of special education, theoretical and technical, he must spend an equal period in the field before he can be recognized or admitted to practise as a full-fledged practitioner. Incidentally it may be noted that doctors and lawyers have certain advantages over us. A lawyer's mistakes generally serve but to make more litigation, to bring more grist to the legal mill. The doctor's mistakes are generally buried five or six feet under-ground. If an engineer makes a mistake, especially if it results in loss of life or money, his professional career is either seriously prejudiced or at an end.

The Engineering Institute of Canada was established thirty-five years ago but it is only within the past six or seven years that local and provincial Branches have been formed. This policy has, up to the present time, at any rate, abundantly proved the wisdom of its adoption, for in the twenty-two cities and towns, from Sydney to Victoria, in which Branches have been organized, every engineer within the radius of activity of each Branch is made to feel that he has a direct personal interest in *The Institute*, and that *The Institute* has a direct interest in him. There is no doubt that the formation of Branches has been of enormous advantage, not merely to the profession at large, but to every member of *The Institute.*

The most portentous step in advance that has ever been made by the profession in Canada was the creation and incorporation in nearly every Province, by acts of legislature, of Associations of Professional Engineers to prevent, by legal enactment, the practice of engineering by incompentent and unqualified men, but while these Associations are expected to be of material benefit to every engineer in the country — and bear in mind that they have not yet passed the experimental stage — their establishment brings corresponding responsibilities. The proper, but not sole or compulsory avenue to membership in an Association, and so to the legal right to practise engineering, is through the E.I.C. It would be difficult and, in most cases, improper for an association to refuse registration to a member of the E.I.C., therefore, it is the serious and obvious duty of the E.I.C. and of its every Branch and every member to see to it that no man is admitted to any class of *The Institute* unless, or until, he is possessed of all the qualifications laid down in our Constitution and By-Laws. It is only by loyal and whole-hearted co-operation in the functions and activities, and by sharing and bearing the responsibilities, of both the Branch and the Association in our respective Provinces that we shall advance our collective or indivudual interest or be worthy members of the best of all professions.

A hearty vote of thanks was moved by Messrs. Bowman and Allen for the splendid service and untiring effort on the part of Mr. Dodwell in the interests of the Branch ever since its inception. Various points in the chairman's excellent address gave rise to considerable discussion, and a very profitable and enjoyable hour was spent in discussing engineering problems and ways and means of furthering the interests of the Branch and the profession at large.

Victoria Branch

Horace M. Bigwood, A.M.E.I.C., Secretary.

Probably the most interesting paper read before the Branch during the season was the one on "The Scientific Making of Concrete" by Professor Duff A. Abrams on Wednesday, May 31st.

Professor Abrams who is director of the Structural Materials Research Laboratory, of the Lewis Institute, Chicago, dealt fully with the work done at the laboratory in the direction of determining the most suitable combination of cement and aggregates to obtain the best results. Several curves and charts were shown as indicating the results attained with various mixtures and with varying proportions of water, which latter the lecturer stated had a very great influence on the resulting concrete; as little water as possible to obtain a plastic mixture being most desirable. The meeting was well attended by *Institute* members and several contractors and architects well known in Victoria were also present. A number of lantern slides of examples of concrete construction were also shown.

As a sequel to the lecture and to follow the principle of visiting work closely connected with the same subject as previously discussed, a visit was made to the works of the B.C. Cement Company at Bamberton on June 2nd, the party being conducted over the plant by the manager, Mr. Tomlin, and the superintendant, Mr. Anderson. The method of manufacture, by the wet process, was fully explained and demonstrated. Before proceeding to the works lunch was partaken of at the Brentwood hotel, when, while lighting up afterwards, Capt. Everall recalled his trenches days by sending up a "flare" in the shape of a match holder full of matches, head up, which he touched off by drawing the one he intended to use, upwards. The result was most effective. No casualties.

Victoria Branch visits Bamberton Cement Works.

Canadian Good Roads Association Convention.

The ninth annual convention of the Canadian Good Roads Association, of which a more detailed account appears elsewhere in *The Journal* is in full swing, at time of writing, in Victoria and there are many *Institute* members in attendance. From Victoria the majority of the visiting members are expected to go on to Vancouver to attend the Western Professional meeting of *The Institute*, together with many local members.

Edmonton Branch

R. H. Douglas, A.M.E.I.C., Secretary-Treasurer.

A meeting of the Branch was held in the Board of Trade rooms at 5 p.m. on Tuesday May 23rd, for the purpose of completing the election of officers of the Branch for the season of 1922-23. The result of the ballot was as follows:—Chairman, J. G. Reid, M.E.I.C.; Vice-Chairman, E. Stansfield, M.E.I.C.; Sec.-Treas.' R. H. Douglas, A.M.E.I.C.; Executive: W. R. Mount, A.M.E.I.C., J. D. Robertson, A.M.E.I.C., R. W. Ross, A.M.E.I.C., A. Stewart, A.M.E.I.C.; (*Ex-Officio:*) C. A Robb, A.M.E.I.C., R. S. L. Wilson, A.M.E.I.C.

On June 8th the Branch held a joint meeting with the Engineering Section of the Board of Trade at which Professor Duff Abrams of the Lewis Institute gave his illustrated lecture on "Scientific Methods of Making Concrete". Over a hundred attended and received much valuable information from Professor Abrams' talk.

* * *

"*Moments and Stresses in (concrete) Slabs*" a valuable report contributed by H. M. Westergaard, Assistant Professor of Theoretical and Applied Mechanics, University of Illinois, and W. A. Slater, Engineer Physicist, United States Bureau of Standards, to the Proceedings of the American Concrete Institute, vol. 17, 1921, 124 pp. has just been made available to those who desire separate copies. The National Research Council, on request, has reprinted the report as Number 32 of its *Reprint and Circular Series.*

This report contains so much information of value to engineers designing and building reinforced concrete structures that a number of men who are authorities in this field recommended that the report be given wider circulation than the limited small edition of the Proceedings. Further information regarding this publication may be secured from the Publication Office, National Research Council, 1701 Massachusetts Avenue, Washington, D.C.

OTHER SOCIETIES NEWS

Canadian Good Roads Association

The ninth annual convention of the Canadian Good Roads Association, being the Pacific Coast Goods Roads Convention, was held at the Empress Hotel, Victoria, B.C., June 12th to 15th inclusive, in co-operation with the Good Roads League of British Columbia and other western Good Roads associations. As is usual at such conventions, *The Institute* was largely represented by those present and members of *The Institute* took a prominent part both on the organization and entertainment committees, while in the papers and addresses given they were the dominating feature. Among the papers presented by members were,—

"Drainage Methods for Prairie Roads" by H. R. MacKenzie, A.M.E.I.C., Chief Field Engineer, Province of Saskatchewan;

"Federal Aid, its Implications and Results" by A. W. Campbell, M.E.I.C., Chief Commissioner of Highways, Dominion Government;

"How to Improve Earth, Clay and Sand Roads" by J. D. Robertson, A.M.E.I.C., Deputy Minister of Public Works, Province of Alberta;

"Cement Concrete Roads"—Discussion by A. E. Foreman, M.E.I.C., District Engineer, Portland Cement Association, Vancouver;

"Road Machinery" by A. L. MacPherson, A.M.E.I.C., Department of Public Works, Victoria;

"Colonization Roads" by W. F. Fullerton, M.E.I.C., Superintendent of Colonization Roads, Province of Ontario.

"Provincial Highways" by Patrick Philip, M.E.I.C., Chief Engineer of Public Works of B.C.

"Asphaltic Concrete Pavements"—Discussion by Charles Mullen, Consulting Paving Engineer, Montreal.

"Foundations" by J. A. Duchastel, M.E.I.C., Manager and City Engineer, Outremont, with discussion by A. F. McCallum, M.E.I.C., Commissioner of Works, City of Ottawa.

"Surface and Sub-soil Drainage" by W. A. McLean, M.E.I.C., Deputy Minister of Highways, Province of Ontario.

"Road Dragging and Maintenance Competition" by H. S. Carpenter, M.E.I.C., Deputy Minister of Highways, Province of Saskatchewan.

As a means of furthering the stated objects of the Canadian Good Roads Association, a resolution introduced by Captain Duchastel was adopted, requesting the co-operation of the Canadian Engineering Standards Association in collecting information and data dealing with roads and road improvements and in recommending standards both of materials and practice for the benefit of the municipalities and provinces of the Dominion.

The Honourable Joseph L. Perron, K.C., of Montreal, Minister of Roads of the Province of Quebec, was elected president of the Association. Other officers elected were:—

Honorary president, S. J. Latta, Regina; first vice-president, Russell T. Kelley, Hamilton; second vice-president, F. L. Fellowes, Vancouver; secretary-treasurer, G. A. McNamee, Montreal; directors, Mayor Jos. Beaubien, Outremont; H. S. Carpenter, A.M.E.I.C., Regina; Wm. Findlay, Toronto; Geo. Hogarth, M.E.I.C., Toronto; J. D. Robertson, A.M.E.I.C., Edmonton; P. Philip, M.E.I.C., Victoria; S. H. Henderson, Winnipeg; G. F. Pearson, Halifax; R. D. Patterson, St. John; A. M. Rankin, M.P.P., Collins Bay, Ont.; T. J. Mahoney, Hamilton; H.H. Shaw, A.M.E.I.C., Charlottetown; J. A. Duchastel, M.E.I.C., Outremont, Que; P. Gommery, Vancouver; R. H. Murray, Halifax.

The following corporate members of *The Institute* were registered in attendance:—

F. W. Anderson, M.L.A., Kamloops, B.C.; C. Brackenridge, Consulting Engineer, Vancouver, B.C.; H. M. Bigwood, Chief Dftsman., P.W. Dept., Victoria, B.C.; J. W. B. Blackman, City Engineer, N. Vancouver, B.C.; C. E. Cartwright, Civil Engineer, Vancouver, B.C.; M. T. Cotton, Engineers and Contractors, Vancouver, B.C.; A. L. Carruthers, Dist. Engr., Prov. P. W., Prince Rupert, B.C.; H. S. Carpenter, Deputy Minister of Highways, Regina, Sask.; A. W. Campbell, Dom. Commissioner of Highways, Ottawa, Ont.; A. Dixon, Dist. Engr. D.P.W., South Fort George, B.C.; J. A. Duchastel, Chief Engr., and Manager, Outremont, Que.; A. E. Foreman, Dist. Engr., Portland Cement Assoc., Vancouver, B.C.; C. F. P. Faulkner, Victoria, B.C.; J. P. Forde, Dist. Engr., Dept. P.W. Canada, Victoria, B.C.; R. Fowler, Municipal Engr., Oak Bay, Victoria, B.C.; C.H. Fullerton, Supt. of Roads, Toronto, Ont.; J. M. Finlayson, Prof. of C.E. University of Manitoba, Winnipeg, Man.; P. Gillespie, Prof. of C.E., University of Toronto, Toronto, Ont.; W. B. Greig, Municipal Engr., Point Gray, Vancouver, B.C.; W. K. Gwyer, Dist. Engr. Dept. P.W., Penticton, B.C.; Col. A. E. Hodgins, Dist. Engr. Dept. P.W., Victoria, B.C.; J. B. Holdcroft, Rep. Contract Record, Victoria, B.C.; Fraser S. Keith, Gen. Secy., *The Engineering Institute of Canada*, Montreal, Que.; P. J. Jennings, Asst. Commissioner of Irrigation, Dept. of Interior, Calgary, Alta.; H. R. MacKenzie, Highway Engr., Regina, Sask.; W. A. McLean, Deputy Minister of Highways, Toronto, Ont.; F. L. MacPherson, Official Engr., Dept. P.W., Victoria, B.C.; Chas. A. Mullen, Consulting Engr.,; Montreal, Que.; E. G. Matheson, Prof. of C.E., University of B.C., Vancouver, B.C.; A. F. Macallum, Commissioner of Works, Ottawa, Ont.; Wm. Pearce, Dept., of Colonization and Development, C.P.R., Calgary, Alta.; P. Philip, Public Works Engineer, Victoria, B.C.; T. Rognaas, Resident Engr., Road Assoc., Victoria, B.C.; J.D. Robertson, Deputy Minister of P.W., Edmonton, Alta.; Wm. Ramsay, Dist. Engr., Dept. P.W., Nelson,

B.C.; J. M. Rolston, Vancouver, B.C.; H. Stewardson, City Engineer, New Westminster,; G. W. Tornroos, Civil Engr., Vancouver, B.C.; T. H. Tracey, Alderman, Vancouver, B.C.; H. S. Van Scoyoc, Canada Cement Co., Montreal, Que.; J. M. Wardle, Chief Engr., Can. Nat. Parks, Ottawa, Ont.; A. A. Young, Engr., Winnipeg, Man.

Canadian Institute of Chemistry

The first book of the Canadian Institute of Chemistry, containing the Constitution, By-laws and List of Members, bears record to the splendid progress resulting from the untiring efforts of those men of Science who conceived the idea and made possible this much needed organization. To this new Institute and to its members, *The Engineering Institute of Canada* extends its most hearty good wishes and congratulations.

The first attempt to secure co-operation between chemists in Canada was made some thirteen years ago by the late Dr. J. P. Girwood, F.I.C. but without definite results. In 1918, following an address by Professor Matthew A. Parker, of the University of Manitoba, before the annual meeting of the Canadian Section of the Society of Chemical Industry, a lively discussion took place as a result of which the chairman of the Canadian Section of the Society of Chemical Industry appointed a committee known as the Chemists Organization Committee, with Professor Parker as chairman and Harold J. Roast as secretary. After a year of steady work, the preliminary report of this committee was made public and correspondence invited. With slight changes and additions, this report was presented as a final report to the Convention of Chemists held in May 1919, at Montreal, under the auspices of the Canadian Section of the Society of Chemical Industry, the local chairman of the Society, Dean Goodwin, of Kingston, being in the chair. With slight modifications, the report was adopted; a nucleus of members elected; and subsequently the first Council elected. In May 1920, at the first annual meeting, held in Toronto, the By-laws were adopted and on August 15th, 1921, the Institute was incorporated as a Dominion Body. At the first of the present year, the Institute had a total membership of 257 as follows:— Honorary Fellows 2; Fellows 166; Associates 39; Students 50.

Chemists in Annual Meeting

At the annual convention of Chemists, held in Ottawa the registration numbered 100 and the meetings of both the Society of Chemical Industry and of the Canadian Institute of Chemistry were all attended.

At the annual meeting of the Society of Chemical Industry, the president, Dr. R. F. Ruttan and vice-president, Theo. H. Wardleworth, were present. Dr. Ruttan is the first Canadian to have been elected to the presidency of the Society of Chemical Industry which organization has on its rolls more than 6,000 members resident in all parts of the world.

The Canadian Institute of Chemistry was incorporated under Dominion Letters Patent in 1921. It is a purely professional organization, created for the purpose of providing machinery whereby the status of the profession of chemistry in Canada might be improved. At the annual elections Professor J. Watson Bain of the University of Toronto retired after two years in office and Dr. John S. Bates, A.M.E.I.C., of the Bathurst Lumber Company, Bathurst, N.B. was elected. Harold J. Roast, secretary since the inception of *The Institute*, retired and was succeeded by L. E. Westman, editor of Canadian Chemistry and Metallurgy, Toronto.

The programme included many papers of interest to the profession among, which were, "The Operation of Koppers By-Produce Oven Plant" by C. E. Wallin, B.A., of the Dominion Iron and Steel Company., Sydney, N. S.; "Analytical Problems in the Metallurgy of Nickel" by E. E. Lathe, M.Sc., of the British America Nickel Corporation, Deschenes, P.Q.; "Soil Corrosion of Iron and Lead" by Dr. J. W. Shipley, University of Manitoba, Winnipeg; "Chemical Products from Natural Gas" by R. T. Elworthy, B.Sc., Department of Mines; "The Constitution of Rubber" by Dr. M. C. Boswell, University of Toronto; "The Education of the Chemist from the stand-point of The Institute" by Dr. L. F. Goodwin, Queens University, Kingston; "How The Institute can best serve the Canadian Chemist" by Dr. J. S. Bates, Bathurst, N.B.; "The Best Method of Handling Publicity for the Chemical Profession" by W. C. Lodge, Montreal.

Canadian Electrical Association Annual Convention

The Canadian Electrical Association held their thirty-second annual convention in Ottawa, on June 15th, at which many members of *The Engineering Institute* were present. In his address, as president, Julian C. Smith, M.E.I.C., stated, as evidence, of the material good resulting to the nation from electrical development, that each year Canada was adding 200,000 horse-power to that already in use. This meant a capital expenditure of $40,000,000 per year. He was hopeful that within a year the question of financing would be relieved.

The industrial strength of any nation was to be judged by the per capita use of power and Canada was fast changing from an agricultural country to a nation of industries, and on that ground the use of power and its development should be encouraged.

Short talks were also given by John Murphy, M.E.I.C., Ottawa; J. B. Woodyatt, A.M.E.I.C., Montreal; and K. Pyke, Montreal.

At the luncheon, which was presided over by the president,.the speaker was, A. Munro Grier, K.C., and his remarks were listened to with interest whenever, through the applause, they could be heard. Mr. Grier is a past president of the association, and in choosing a subject for his address he decided to call it "Loyalty," although, as he said, it might carry many names. "The most loyal man to the association," said the speaker, "was not the man who thought all the virtues were resident in the association. Those who best served were those whose heart and soul were alive to the virtues of others.

The man who loved his country because he hated all others was not the best citizen." Loyalty was something that came down from the top to the bottom, and then spread up to the top again. He spoke of the importance of personal loyalty in business, and this carried out meant a great increase in business efficiency. "We in Canada," he said, "have no right but to do our best." The man who thought his country fine and noble would not only boost, but would do his best. The heritage handed down to us and shared by the American people from the same stock, the heritage of fineness of character, is such that we have no right to be small and mean; we must be worthy of the Empire to which we belong.

In the evening D'Arcy Ryan gave a very interesting address on "Illumination," reviewing the subject from its earliest known history, — the crude lamps of the cave dwellers to the magnificent lighting of the San Francisco Exposition, of which latter Mr. Ryan was the engineer. Mr. Ryan is a Canadian by birth and has devoted his life's effort to study and research in the science of illumination. The results of his creative genius in lighting are in nearly every great city of the world and in the new world, particularly. He has just recently returned from Rio de Janeiro, where he has installed the illumination system for the Brazilian Exposition.

Corporation of Professional Engineers of Quebec

The official list of members of the Corporation of Professional Engineers of Quebec for 1922, which contains about eight hundred names, is at present being printed and will be distributed to all Courts of Justice, the secretaries of all towns and cities in the Province, the railways and the larger corporations, as well as to each member.

Canadian Engineering Standards Association.

Seventh Meeting of the Main Committee.

The seventh meeting of the Main committee of the Association was held in Ottawa at the offices of the Association on the 24th of April, H. H. Vaughan, M.E.I.C., in the chair. This meeting being the first held since the death of Sir John Kennedy, Hon. M.E.I.C., the resolution of condolence which was passed by the committee in November last was reported as having been forwarded to Lady Kennedy, and the chairman and other members of the committee spoke feelingly of the loss sustained by the Association through Sir John's death.

The following changes in the personnel and renominations of members of the Main committee were reported:— Sir Alexander Bertram, M.E.I.C., nominated by *The Engineering Institute of Canada*, replacing W. F. Tye, M.E.I.C.; O. W. Lefebvre, nominated by the Ecole Polytechnique, replacing A. Surveyor, M.E.I.C.; Dr. L. A. Herdt, M.E.I.C., renominated by McGill University; Dr. R. A. Ross, M.E.I.C., renominated by the Research Council; Prof. P. Gillispie, M.E.I.C., renominated by the University of Toronto; T. F. Sutherland, renominated by the Canadian Institute of Mining and Metallurgy; A. R. Goldie, renominated by the Canadian Manufacturers' Association. W. A. Bowden, M.E.I.C., having been nominated as a member of the Main committee by the Department of Railways and Canals, replacing Colonel Monsarrat, M.E.I.C., it was decided to co-opt Colonel Monsarrat as a member so as to retain his services on the committee.

The following were unanimously elected as the officers of the Association for the coming year, and as such, constitute the Executive committee; Chairman, H. H. Vaughan, M.E.I.C.; Vice-Chairman, T. A. Russell and D. H. McDougall, M.E.I.C.; Honorary Secretary-Treasurer, Dr. J. B. Porter, M.E.I.C.

Standard Specifications for Steel Railway Bridges.

The Association has recently added another valuable volume to its list of publications in the new Standard Specifications for Steel Railway Bridges, which is now available for distribution. The first edition of these specifications was issued in 1920 and has since been exhausted. The present edition embodies certain changes in the revision, re-arrangement and expansion of a number of clauses, while the section dealing with moveable bridges, which appeared in the former edition, has been withdrawn and is at present being prepared as a separate specification for moveable bridges.

Town Planning Notes and Comments

Horace L. Seymour, A.M.E.I.C.

NOTE. — *In order to make this column of wide interest to members of The Institute, personals and items of town planning interest will be appreciated. Address: Horace L. Seymour, A.M.E.I.C., 40 Jarvis Street, Toronto.*

The fourteenth annual meeting of the National Conference on City Planning was held this year from June 5th to 7th., at the city of Springfield, Mass. Of the various Town Planning organizations in North America, this National Conference on City Planning is undoubtedly the most important. Canada's quota this year was a small one but included A. E. K. Bunnell, A.M.E.I.C., managing engineer of the Toronto Civic Guild and A. V. Hall, landscape architect, Toronto.

In the advance notice of the meeting there were mentioned several matters that are of particular importance. One is, that every city in the United States with a population of over 300,000 has adopted city planning as a part of its official program. The other matters deal with those features of recent development in town planning — the garden city and regional planning.

Mariemont, a complete town, is to be built near Cincinnati, Ohio, as an exemplar of planning ideals after the fashion of Letchworth, England, but with American adaptations. "Its success," says the circular on National Conference on City Planning, "will revolutionize city living." The same circular draws attention to the development in regional planning.

In view of the importance attached to the garden city and to regional planning, it is considered that some information might be given in these pages.

The Garden City

The June issue of "Garden Cities and Town Planning," (England), states in the "Editorial Comments" under the caption of "The Importance of the Man in the Street":

"The future of the town planning movement — which is full of hope — depends upon the man in the street. He, at last, is formulating some sort of opinion on town planning; he knows now that it is not a political dodge, nor an aesthetic fad, but a practical proposition, which will pay dividends, partly in human happiness — the possibility of which always interests him — and partly in hard-cash rebates on rates and taxes — the necessity of which comes second only to that of personal liberty as his most deeply-rooted conviction. In spite of all the discouragements of this post-war period, he is advancing rapidly on a line of thought which might be termed "**the road to Letchworth.**" Foreign travel — the Kaiser became in 1914 the greatest tourist agent in history — taught him that civilization can express itself in terms other than town agglomerations; the talk of reconstruction made him conscious that there was much to reconstruct; his very disappointments have made him realize that, if reconstruction be so difficult, fresh construction must be regulated to prevent any early necessity of its being done all over again."

In the same issue of this magazine there is an article entitled, "How to get Garden Cities established throughout the World". This is taken from a paper presented to the Conference of the International Garden Cities and Town Planning Association at Olympia, England, March 15th, 1922. Some extracts from this article are of exceeding interest:

"The garden city movement is different from all other movements for the improvement of cities and the revival of rural life, in that it rests upon the conception of a new form of town structure with a definite economic basis. The garden city is a town — not a village or a suburb or a housing scheme — functioning as a social organism, the economic foundation of which is control of its own land values."

"The garden city movement would not have survived in England had Letchworth not been founded; and the movement has greatly revived since Welwyn Garden City was started eighteen months ago. Examples of garden cities in the various counties of the world would do more to bring the movement into the first place as an international force than anything else. These examples should not be expected to follow the exact pattern of Letchworth or Welwyn Garden City. There is no set type of garden city plan. Each national garden city should be designed in accordance with national taste and economic needs. But it is important, if the example is to have any value, that a true garden city should be aimed at. It must, at least, fulfill the following conditions:

"It must be a town, large enough to have all the features of a town characteristic of the country in which it is placed. It must provide for all classes of the community, so that it may possess a sound civic being. It must provide for industry to be carried on. It must be planned as a whole. It must combine rural interests with urban interests. Finally it must **control** the whole of the land which it is built and surrounding it."

It might be mentioned that a garden city is one that is definitely limited in extent, its boundaries being determined by a permanent agricultural belt or zone of land surrounding the city. The only way it can be enlarged is by the creation of another unit. To those who see the menace to health and happiness of the big city, the garden city will no doubt appeal. A Premier of one of our provinces recently remarked that he would rather have fifty cities of 10,000 each than one city of 500,000.

The article, referred to above, mentions that "At present there are two garden cities in progress in England, there are none elsewhere." In view of this, the announcement in regard to Mariemont is interesting, also the fact that the garden city idea is to be adapted in part at least to an existing town in Florida — Coconut Grove. There is proposed a productive park strip owned by the municipality, surrounding the heart of the town.

Regional Planning.

The proceedings of the First Regional Planning Conference of Los Angeles County, California, held at Pasadena, January 21st., 1922, are worthy of study:

"In the city planning work of Los Angeles city, and presumably in surrounding cities, it was early recognized that large though the city was the efficacy of its planning work was largely interfered with through limitations imposed by the existence of arbitrary municipal boundaries. Consideration of city planning problems at once evidenced the fact that the origin of some problems was to be found largely in communities or areas beyond the corporate limits of the city and outside of the munucipality's jurisdiction. It was obvious that the solution of problems thus arising was dependent largely to the degree that co-operation could be effected between the communities jointly contributing to or suffering from the problems. Prominent among the subjects thus considered was that of transportation, with reference both to rapid transit by rail and the ever increasing utilization of the motor vehicle over the boulevards. Another subject of primary importance was the supervision of new subdivisions through the means of which not only Los Angeles but the whole metropolitan area is rapidly being converted from raw country land into city property. The need for a unification in standardized requirements and standardized procedure in this subject was early manifested. A third subject of the many, and of primary importance, was the matter of sanitation as applied especially to sewage disposal. The interdependence of municipalities in this respect has been, and is increasingly becoming, especially apparent."

The proceedings of this conference include reports on the following subjects: Highways, Subdivisions, Transportation, Sanitation, Flood Control, Parks and Boulevards, Zoning, Legislation, Finance, Water Supply and Topography, which were contributed by prominent engineers. The Special Sewage Disposal Commission numbers amongst its members George W. Fuller of New York city and George C. Whipple of Cambridge, Mass.

According to the June issue of the "American City" magazine — on the initiative of the Russell Sage Foundation a committee has been appointed for the "Plan of New York and its Environs". This announcement was made on May 10th, 1922 at a meeting held in the Engineering Societies building, at which were present architects, engineers, artists, town planners and community workers. Amongst the speakers was Herbert Hoover who, we are always glad to remember, is an engineer. He said in part:

"The enormous losses in human happiness and in money which have resulted from lack of city plans which take into account the conditions of modern life, need little proof. The lack of adequate open spaces, of playgrounds and parks, the congestion of streets, the misery of tenement life and its repercussions upon each new generation, are an untold charge against our American life. Our cities do not produce their full contribution to the sinews of American life and national character. The moral and social issues can only be solved by a new conception of city building.

The vision of the region around New York as a well-planned location of millions of happy homes and a better working centre of millions of men and women, grasps the imagination. A definite plan for its accomplishment may be only an ideal. But a people without ideals degenerates — one with practical ideals is already upon the road to attain them."

The area to be planned for will provide for an urban population of thirty-seven millions.

An Act Respecting Professional Engineers

His Majesty, by and with the advice and consent of the Legislative Assembly of the Province of Ontario, enacts as follows:—

1. This Act may be cited as "The Professional Engineers' Act, 1922".

2. In this Act.

(a) "Association" shall mean the Association of Professional Engineers of the Province of Ontario.

(b) "Board" shall mean the Board of Examiners of the Association.

(c) "Council" shall mean the Council of the Association.

(d) "Licensed" shall mean that permission has been granted by the council to a non-resident engineer to practise temporarily without being registered, and "License" shall mean the official certificate under the seal of the Association evidencing such permission.

(e) "Member" shall mean a Registered Member of the Association.

(f) "President" shall mean the President of the Association.

(g) "Professional Engineering" save as hereinafter mentioned, shall mean the advising on, the reporting on, the designing of, the supervising of the construction of, all public utilities, industrial works, railways, tramways, bridges, tunnels, highways, roads, canals, harbour works, light houses, river improvements, wet docks, dry docks, floating docks, dredges, cranes, drainage works, irrigation works, waterworks, water purification plants, sewerage works, sewage disposal works, incinerators, hydraulic works, power transmission, steel, concrete and reinforced concrete structures, electric lighting systems, electric power plants, electric machinery, electric apparatus, telephone systems, telegraph systems, cables, wireless plants, mineral property, mining machinery, mining development, mining operations, gas and oil developments, smelters, refineries, metallurgical machinery, and equipment and apparatus for carrying out such operations, machinery, steam engines, hydraulic turbines, pumps, internal combustion engines and other mechanical structures, chemical and metallurgical machinery, apparatus and processes, aeroplanes, air ships, and all other engineering works.

(h) "Registered" shall mean that an engineer has been admitted to membership in the Association and that his name has been enrolled in the register; and "Certificate of Registration" shall mean the official certificate under the seal of the Association evidencing the same.

(i) "Registrar" shall mean the Registrar of the Association.

(j) "Secretary" shall mean the Secretary or the Secretary-Treasurer of the Association.

(k) "Vice-President" shall mean the Vice-President of the Association.

3.—(1) All persons registered as professional engineers under the provisions of this Act shall constitute the "Association of Professional Engineers of the Province of Ontario" and shall be a body politic and corporate, with perpetual succession and a common seal.

(2) The head office of the Association shall be at the City of Toronto.

(3) The Association shall have power to acquire and hold real or personal property not producing at any time an annual income in excess of $10,000, and to alienate, mortgage, lease, or otherwise dispose of such property or any part thereof as occasion may require.

(4) All fees, fines and penalties receivable and recoverable under this Act shall belong to the Association.

4. The Association may pass by-laws not inconsistent with the provisions of this Act for:—

(a) The election of "Council".

(b) The government and discipline of the members.

(c) The management of its property.

(d) The appointment of such officers as may be necessary for carrying out the purposes of the Association;

(e) The maintenance of the Association by fixing, levying and collecting the necessary fee from each member and licensee, which fee shall not exceed $10 per annum;

(f) The admission of candidates to registration;

(g) The keeping of the "register";

(h) Fixing dates and places of meetings of the "Association."

(i) All such other purposes as may be deemed necessary or convenient for the management of the association, or the conduct of its business.

5. No by-law of the association or amendment thereto shall be valid or take effect until approved by the Lieutenant-Governor in Council.

6.—(1) For purposes of representation upon the council and for registration, and for such purposes only as are hereinafter set out, membership of the association shall be subdivided into the following branches: Civil Engineers, mechanical engineers, chemical engineers, electrical engineers, mining engineers.

(2) Each member admitted to the association may register in all branches for which he can submit credentials satisfactory to the authority governing admission to each of such branches, but he shall, however, vote in only one such branch according to his own selection, but may transfer his vote to some other branch in which he is registered, upon the approval of the council.

7. Additional branches may be established by the Lieutenant-Governor in Council upon the petition of not less than 100 registered members of the association, provided such petition be approved by the council, or upon petition of 200 members of the association if such approval be not obtained.

8.—(1) The council shall consist of a president, a vice-president, an immediate past-president and three councillors from each branch of the association, all of whom shall be registered members of the association.

(2) The president, who shall be elected annually by vote of members, shall hold office until his successor is elected, shall act as presiding officer at the meetings of the council and of the association, voting only when the votes are evenly divided, and on his retirement shall hold office as councillor for the next year succeeding.

(3) The vice-president shall be elected annually by vote of members, and shall have all the powers of the president during the absence of the latter.

(4) The councillors shall be elected annually from each branch of the association by the vote of the registered members in such branch and one councillor from each branch shall be appointed by the Lieutenant-Governor in Council.

(5) The council shall appoint a registrar and a secretary who shall hold office during the pleasure of the council.

9.—(1) The members of the council representing each branch shall control, subject to the terms of this Act, the conditions for registration and for licensing in such branch, including credentials, examinations and exemptions.

(2) The council as a whole shall have the power to review the establishment of and the carrying out of the conditions for registration as administered by the representative councillors from all branches, and shall have the power to require the representatives of such branches to modify their administration in order to maintain a standard of qualification in members satisfactory to the council.

(3) The revocation of certificates and the reissuing of such certificates, the questions of discipline, fines, suspensios, expulsions, finance, overlapping of practice in branches, and all matters not coming within the provisions of sub-section (1) shall be dealt with by the council as a whole.

Registration Within One Year.

10.—(1) Any person residing in the Province of Ontario at the date of the passing of this Act, who has been engaged in engineering for five or more years, shall be entitled to be duly registered as a member of the association without examination, provided that such person shall produce to the council, within one year of the passing of this Act, satisfactory evidence of having been so engaged.

(2) Any person residing in the Province of Ontario, not qualified as in subsection (1) above, may make application for membership in the association and shall successfully pass such examination as shall be prescribed by council, or submit credentials satisfactory to the council, to be admitted to membership.

(3) Any person who applies for membership in the association within one year from the passing of this Act shall submit to the council with his application a statement giving a summary of his engineering experience which statement shall be made upon the forms prescribed by the council.

(4) The council may require the applicant for membership to prove the correctness of the statements made in his application by attesting by oath or by affidavit.

(5) If the evidence of employment as engineer for five years, as submitted by the applicant, be considered satisfactory by the members of the council representing the branch to which admission is desired, he shall be admitted to membership in the association without examination and the registrar shall issue a certificate of registration to applicant and enter his name in the register.

(6) Any person duly authorized and registered as an Ontario land surveyor at the date of the passing of this Act shall be entitled on application within one year of the passing of this Act, to be admitted as a member of the association in the branch of civil engineers.

11. If the applicant for membership has been engaged for less than five years as a professional engineer at the date of the passing of this Act, he shall submit certificates and proofs respecting the period of his employment to the date of his application, and the members of council, representing the branch to which permission is desired, will determine from the evidence so submitted the period of such employment.

Registration After One Year.

12. Any person resident in the Province of Ontario who has applied for membership in the association within one year from the passing of this Act, who has not been admitted under the provisions of section 10, shall file with the secretary a notice setting forth his employment and the name of his employer, which notice shall be filed annually during the term necessary to complete the five years of employment, and if such person's record of employment is satisfactory, he shall be admitted to membership without examination.

13.—(1) Any person who applies for membership in the association after one year from the passing of this Act shall submit to the council with his application a statement giving a summary of his experience as an engineer or surveyor which statement shall be made upon the forms prescribed by the council.

(2) The council may require the applicant for membership to prove the correctness of the statement made with his application by attesting by oath or by affidavit.

(3) If the evidence of engineering experience for not less than five years, as submitted by the applicant, is considered satisfactory by members of council representing the branch to which admission is desired, the applicant shall be admitted to membership after successfully passing the prescribed examination in the theory and practice of such branch of engineering or, in lieu of such examination, upon submission of evidence satisfactory to the members of council representing such branch and to the council as a whole.

(4) An applicant who is required to successfully pass an examination may select any one or more branches of engineering for his examination.

14. Any resident of Canada who may come to reside in the Province of Ontario and who at the time is a duly registered member of an association of professional engineers in any province of the Dominion of Canada similarly constituted to this association, may upon application made to council be admitted to membership upon producing a certificate of membership in such province.

15. Any person who comes to reside in Ontario who is a registered member of any association or institute in other parts of the British Empire or in the United States similarly constituted to this association, and which grants reciprocal privileges and who applies for membership in this association, may be admitted to membership upon producing to council a certificate of membership in such association or institute.

Graduates.

16.—(1) Any graduate in any branch of engineering or of science, the practice of which constitutes professional engineering as defined in clause (g) of section 2, from any university recognized by the council upon presenting evidence of graduation satisfactory to the council will be granted, as part of his term of employment, the actual time of instruction in such university, this total not to exceed four years and such graduate will not be required to submit to a written examination.

(2) Graduates or undergraduates of recognized engineering colleges or bona fide assistants serving under articles may during the remainder of their respective periods required for registration be engaged in professional engineering as defined in this Act under the guidance of professional engineers who assume full responsibility for their work, but shall not be classed as professional engineers until registered as members of the association as provided in this Act.

(3) Such graduates, undergraduates, or assistants serving under articles may, during their respective engineering courses or terms of service, be recorded with the association, and such graduates, undergraduates, or assistants serving under articles shall be subjected to the control of the council as provided in this Act and to the by-laws of the association, but shall not be members of the association.

Licensing.

17.—(1) Any person not residing in the Province of Ontario who is a registered member of an association of engineers similarly constituted of any other province of the Dominion of Canada may upon application obtain from the registrar a license to practise as a professional engineer in the Province of Ontario upon production of evidence of his registry in such other province.

(2) Any person who is not a resident of Canada, but who in the opinion of the members of council in any branch is recognized as a consulting specialist in such branch of engineering, and has had not less than ten years of experience in the practice of his profession, or who presents evidence to satisfy such members of council that he has equal qualifications with those required for registration in such branch of the profession, may, with the approval of the members of council of such branch, be granted a license to practise in that branch.

(3) Any professional engineer who is a resident of some other province of Canada in which there is no association of engineers similarly constituted may obtain a license to practise in a branch of engineering, subject to the approval of the members of council representing such branch.

(4) In the event of any such person mentioned in this section being unable by reason of emergency or neglect on the part of the registrar, or for any other good and sufficient reason, to obtain such license within three months of his making application therefor, he shall be entitled to practise as a professional engineer in the province for such period of three months without holding such license.

18. Any person who is employed as a professional engineer by a public service corporation, public utilities or Government department, who is by reason of his employment required to practise as a professional engineer in provinces other than that of his residence, may so practise in the Province of Ontario without holding a non-resident license or payment of fee, providing such person can on demand of the council produce credentials satisfactory to the council showing that he is a registered member of an association of engineers similarly constituted by some other province of Canada.

Membership

19.—(1) Only such persons who are members of the association hereby incorporated, and registered as such under the provisions of this Act, or who have received a license from the council of the association as hereafter provided, shall be entitled within the Province of Ontario to take and use the title "Registered Professional Engineer," or any abbreviation thereof.

(2) Each member of the association shall have a seal, the impression of which shall contain the name of the engineer and the words "Registered Professional Engineer" and "Province of Ontario", with which seal he shall stamp all official documents and plans, and the design of such seal shall be approved by the council.

20. The provisions of this Act shall not apply against any person while carrying on his duties in His Majesty's naval, military or aerial service.

21. Engineers who were employed in professional engineering in the Province of Ontario, and who were accepted for overseas service in the war of 1914-1919, in the forces of Great Britain or any of her allies, shall on their return to Canada be entitled to all the rights and privileges conferred under section 10.

22. Notwithstanding any other provision of this Act, no person shall be registered as a member of the association until after he has attained the age of twenty-one years.

Partnership.

23.—(1) In the cases of two or more persons carrying on a practice as professional engineers in co-partnership, only such members who are registered or licensed under this Act shall individually assume the function of a professional engineer.

(2) A firm or corporation of professional engineers cannot, as such, be deemed to be a member of the association or be licensed to practise.

Examinations.

24. The council shall appoint annually a board of examiners for each branch of engineering from nominations made by members of council representing each of such branches.

25.—(1) Examinations of candidates for registration or for license shall be held at least once per annum, at such place or places as the council may direct.

(2) The scope of the examinations and the methods of procedure shall be prescribed for each branch by the members of council representing such branch, with special reference to the applicant's ability to design and supervise engineering works which shall insure the safety of life and property.

(3) The board shall examine all degrees, diplomas, certificates and other credentials presented or given in evidence for the purpose of obtaining registration or license to practise, if referred to them by the council, and may require the holder of such degree, diploma, certificate or other credentials to attest on oath, viva voce or by affidavit concerning the matter of his application.

(4) The candidate shall submit to an examination before the board, or before such members of the board as may be deputed by the council to conduct such examination, on such branch or branches of professional engineering as the candidate may select.

(5) As soon as possible after the close of each examination the members of the board who shall have conducted such examination shall make and file with the secretary a certificate stating the result of such examinations, whereupon the council shall notify each candidate of the result of his examination and of their decision upon his application.

(6) A candidate failing on examination may after an interval of not less than nine months be examined again.

(7) The council shall from time to time prescribe the fees payable by candidates for examination, which fees shall be payable in advance by the candidates.

26. The council shall have power to establish conjointly with any council of any association similarly constituted in one or more of the provinces of Canada a central examining board, and to delegate to such central examining board all or any of the powers possessed by the said council respecting the examinations of candidates for admission to practise, provided that any examination conducted by such central examining board shall be held at least in one place within this province.

Register and Registrar.

27.—(1) The registrar shall issue a certificate of membership to each member admitted to the association by the council, such certificate to be signed by the president or the vice-president and by the registrar, and it shall bear the seal of the association, and shall also state the branch or branches of engineering in which the member was examined or otherwise accepted.

(2) The registrar shall issue a license to practise to any person entitled thereto, such license to specify the work upon which the holder of the license is to be employed and the period for which the same is issued, but in no case shall the period extend beyond the end of the calendar year in which such license was issued.

(3) The registrar shall enroll in the register provided by the council the names of all persons admitted to the association by the council also the names of all persons licensed by the council.

28. The registrar shall keep the register correct and in accordance with the provisions of this Act and the instructions of the council.

29. The annual fee due from a member shall be deemed to be a debt due the association and may be recoverable with the costs of same from such member in the name of the council or of the accociation in any court of competent jurisdiction.

30.—(1) If any member neglects or refuses to pay the annual fee for six months from the date upon which it became due after written notice from the secretary to the member's last known address on the register, the registrar shall cause the name of such member to be erased from the register, and such person shall thereupon cease to be a member, but such person shall at any time thereafter, upon payment of such fees as may be prescribed by the council, be entitled ro reinstatement as a member.

(2) Any member may resign from membership in the association upon giving written notice to the secretary and by payment of all dues in arrears, if any, whereupon the name of such member shall be erased from the register and such member shall be relieved of the liability for further annual dues, but such person shall at any time in the future be admitted as a member upon payment of the fees prescribed by the council.

(3) Any member whose name has been erased from the register shall not be entitled to any of the rights and privileges conferred by the provisions of this Act until he has been re-admitted as a member.

31. In case the council should refuse to register any applicant for membership in the association, or refuse to issue a license to practise to any applicant therefor, the person aggrieved shall have the right to apply to a judge of the Supreme Court of Ontario, who upon due cause shown may make an order directing the council to register the name of such person as a member of the association, or to grant a license to practise, or make such other order as may be warranted by the facts, and the council shall forthwith comply with such order and such order when so made shall be final.

32. The certificate of registration under the seal of the association shall be **prima facie** evidence of registration.

Suspension or Expulsion.

33.—(1) The council may, in its discretion, reprimand or censure or suspend or expel any member guilty of unprofessional conduct, or of gross negligence or of continued breach of the by-kaws of the association, or any member convicted of a serious criminal offence by a court of competent jurisdiction.

(2) The council shall not take any such action until after a complaint under oath has been filed with the secretary or the registrar, and a copy forwarded to the member accused, who shall be given an opportunity of submitting evidence in his defence, and the council shall not suspend nor expel a member without having previously summoned him to appear before the council, nor without having heard evidence under oath offered in support of the complaint and in behalf of the member accused.

(3) The council shall have the same powers as Commissioners under **The Public Enquiries Act** to compel witnesses to appear and give evidence under oath in the manner and under penalties prescribed by such court, and all such evidence shall be taken in writing or by a duly qualified stenographer.

(4) Any member suspended or expelled may within sixty days after the order of suspension or expulsion appeal to a judge of the Supreme Court of Ontario from such order or resolution, giving not less than seven days' notice of such appeal to the secretary of the association, and the practice and procedure in such an appeal shall be the same as upon an appeal from a master or referee.

(5) Pending an appeal, the member suspended or expelled by council may continue to practise, but unless the order of suspension or of expulsion be set aside, the member so suspended or expelled shall not practise thereafter except upon the expiry of the period of suspension (in case of suspension).

Penalties

34. Any person in the Province of Ontario who, not being registered as a member of the Association in the Province of Ontario, or licensed by the association.

(a) Uses verbally or otherwise the title of professional engineer, or makes use of any addition to or abbreviation of such title, or of any words, name or designation that will lead to the belief that he is a professional engineer or a member of the Association;

(b) Advertises or holds himself out in any way or by any means as a member of the Association;

shall be liable upon summary conviction by any court of competent jurisdiction to a fine of not less than $100 nor more than $200 for the first offence, and to a fine of not less than $200 nor more than $500 for any subsequent offence.

35. If the registrar makes or causes to be made wilful falsification of the register, or in matters connected therewith, he shall upon conviction be liable to a fine of not less than $100.

36. Any person who wilfully procures or attempts to procure for himself registration as member in the association by making, producing or causing to be made or produced any fraudulent representation or declaration, either verbal or written, and any person knowingly aiding and assisting him therein, shall upon conviction be liable to a fine of not less than $200.

37. Any and all penalties imposed under this Act, and any and all moneys forfeited shall be recoverable with costs under the provisions of **The Ontario Summary Convictions Act**, and all such sums shall belong to the association.

38. No proceedings shall be commenced for any violation against the provisions of this Act after one year from the date of the committal of such violation.

Provisional Council

39.—(1) The following persons are hereby constituted as a provisional council of the association:—

President— Charles Hamilton Mitchell, of Toronto. Vice-President—Robert Alexander Bryce, of Toronto. Councillors—Representing branch of Civil Engineers—Willis Chipman, of Toronto; John Bow Challies, of Ottawa; Andrew Wellington Gray, of Westport.

Representing branch of Mechanical Engineers—Henry G. Acres, of Toronto; Harry Holborn Angus, of Toronto; Arthur Knowlton Spotton, of Galt.

Representing branch of Chemical Engineers—James Watson Bain, of Toronto; Stafford Frederick Kirkpatrick, of Ottawa; Harold Van der Linde, of Toronto.

Representing branch of Electrical Engineers—Henry U. Hart, of Hamilton; Frank Richard Ewart, of Toronto; Morris James McHenry, of Walkerville.

Representing branch of Mining Engineers—George Reginald Mickle, of Toronto; H. E. T. Haultain, of Toronto; James McEvoy, of Toronto;

all of whom shall hold office until their successors have been elected and appointed.

(2) If a vacancy should occur in the Provisional Council it shall be filled by the Lieutenant-Governor in Council, who shall notify each member of the Provisional Council of such appointment.

40.—(1) The Provisional Council shall provide the register called for by this Act, and shall cause to be entered therein the names of all persons who are entitled to registration and who apply therefor.

(2) The Provisional Council shall, within four months from the passing of this Act, prepare provisional by-laws not inconsistent with the Act for the various purposes specified in section 4 of this Act, which shall not be valid until approved by the Lieutenant-Governor in Council.

(3) The Provisional Council shall publish a copy of the register within five months from the passage of this act, and shall mail one copy of such register to each member, and to any person who may apply for a copy, and the Lieutenant- Governor in Council shall also be furnished with a certified copy of the register and of the provisional by-laws.

(4) The Provisional Council shall call a general meeting of the members of the association for the purpose of electing the members of council, for confirmation or revision of by-laws, and for organization purposes, and for such other purposes as specified in the notice calling the meeting, such general meetings to be held not later than seven months, nor earlier than five months after this Act comes into force.

41. No provisions of this Act imposing penalties shall take effect until one year after the coming into force of this Act.

42. This Act shall come into force and take effect on the day upon which it receives the Royal Assent.

CORRESPONDENCE

The Transmission of Energy by the Water Molecule. Its Relation to Basic Production.

Storage of the Sun's Energy. The results of Research in Molecular Physics.

Toronto, June 6th, 1922

Editor, *Journal:*—

Dear Sir:—

It was suggested to the writer that something further might be contributed to the questions so interesting discussed by Professor R. W. Boyle in his paper on "Rainmaking" in the May number of *The Engineering Journal.* Professor Boyle need not offer any apology for introducing "the physics of a very common and ordinary phenomenon" but the writer will go further by saying that some phenomena are so common and ordinary as to have hitherto escaped any critical examination at all. This is especially true of some phenomena to which the writer wishes to call attention in the hope of closing one of the wide gaps that still exist in our knowledge of the world about us.

One of the key problems introduced by Professor Boyle is that of the latent heat of condensation. We know the exact amount of this heat energy; we know that it disappears when water is turned into steam, that it reappears in exactly the same amount when steam is condensed into water, and that the temperature remains constant at 100°C during these changes. But we do not know the form or the exact location of this energy while it is hidden or "latent" in the steam. The solution of this question would very probably throw light on some others of great practical importance such as those related to the production of the vast fields and forests of Canada.

To fix our ideas, let us think of a cubic centimetre of water. Its mass is one gram. When it is turned into steam at air pressure it occupies 1,700 cu. cm. In that form it consists of thirty-four thousand billion billion molecules separated from one another. Each is a tense, hard, but elastic sphere having a diameter of 0.0000000385

cm. and the mean distance between them is about twelve times this diameter. Each has its own random velocity which is uninfluenced by the others except when the molecules happen to come into contact with each other and with the sides of the containing vessel. We know that these molecules in this separated condition contain somehow or other 498 calories of heat energy which they did not contain when as water they occupied only one cubic centimetre at the same temperature. So long as the molecules are in this separated condition this large quantity of energy cannot by any known means be detected, although its amount is sufficient to raise the temperature of five times the quantity of water from the freezing to the boiling point.

Many attempts have been made to trace this energy to its source. The fact that the steam engine is able to do work only after this enormous amount of latent heat energy has first been expended shows how important is the question. Unless this energy is recovered as heat which can be used at temperatures below 100° C it is a total loss economically. But steam engines and steam heating plants still continue to distribute heat by mysteriously hiding it away on its journey. Various speculations, or hypotheses as they are called, regarding the nature of this energy have been put forward but all to little purpose. One of these hypotheses is that of molecular attraction, by which two molecules when close together are thought of as pulling each toward the other just as the earth and the moon attract each other by gravitation but with a much stronger force. This force, however, ceases to pull at all when the molecules are more than two or three diameters apart. In steam, therefore, the molecules are too far apart for them to attract each other except when they are near collisions. Another and more modern hypothesis conceives of two molecules as both pulling and pushing each other simultaneously with two forces which depend by different laws on the distance the molecules are apart. Now while these two hypotheses may tell us the way in which two molecules may be held together in water, they do not tell us how the molecules of steam hold the latent heat energy. It was thought also that they showed how the surfaces of all liquids are endowed with that tension which we know pulls against itself at all points and in all directions in that surface, but these explanations are not now seriously entertained although they are in all text books which deal with surface tension.

The writer proposes to show how these two problems concerning the latent heat of steam and the nature of surface tension were both solved by a single method which disclosed as well how the sun's energy is held in the atmosphere and transmitted to the different parts of the earth's surface.

As in the surface of water in a vessel so in the surface of a rain drop there is this tension or force pulling against itself to lessen the extent of that surface. On each side of a line 1 cm. long it pulls with a force of 73.3 dynes. (1,000,000 dynes is the air pressure on a square centimetre.) In consequence of this tension each square centimetre of water possesses 73.3 ergs of potential surface energy (P.S.E.); (41,840,000, or J, ergs is one calorie, which is the energy required to raise one gram of water through 1° C.). Now, since long before the first shower wet the skins of primative man, water drops have coalesced whenever they came into contact, and large ones have broken into smaller ones whenever the sea dashed itself against the rocks. Suppose, then, that three rain drops 0.3, 0.4, and 0.5 cm. in diameter come into contact and coalesce. The resulting sphere will have a diameter of 0.6 cm. By this act the total surface has been reduced by 0.44 sq. cm. Consequently, the P.S.E. has been reduced by 0.44x73.3 or 32.3 ergs. This energy is now in the form of heat and the water will be so much warmer, (0.000068° C). If the temperature remains constant, the heat will be available for other purposes. On the other hand it will require exactly this amount of energy to break up the large sphere into the three smaller ones again, and the energy will then be properly called the latent heat of the three spheres. This simple piece of reasoning suggests that latent heat is simply surface energy which has to be supplied whenever the free surface enveloping mass is increased and which reappears whenever that surface is decreased in extent.

The writer published the general case of the reasoning above in the Philosophical Magazine in June 1921, pp. 878-889, and it may be well to give here a brief outline of its main features.

The amount of P.S.E. changed into heat when N drops of water each having a diameter of d cm. coalesce into one mass is proved to be

$$T\left(\frac{36\,\bar{\pi}\,m^2}{\rho^2}\right)^{1/3} N^{1/3} \text{ ergs,}$$

where $\bar{\pi}$ is the molecular weight of the substance, ρ its density, and T its surface tension. If L is the latent heat in calories of one gram mass of the substance, the total latent heat of m grams is mLJ ergs. When these two amounts of energy are put equal and the resulting equation solved, we obtain

$$N = \left(\frac{(LJ)}{T}\right)^3 \frac{m\rho^2}{\bar{\pi}}$$

Now it has been proved experimentally that the surface tension of a liquid increases by the same amount for each degree that the temperature is lowered. It will, therefore, have its maximum value at — 273°C even though the liquid has become a solid. The reason that surface tension increases with lowering temperature is that the molecules in the liquid lose in velocity as the temperature goes down. At — 273°C the molecules are at rest and the tension is that of the molecule itself. For water the molecular tension is 133.6 dynes, per cm. Also after allowing for the work of pushing the air back to make room for the steam there remains 498 calories of energy which is the true latent heat of a gram mass of steam. Moreover, the molecules of water at 4°C may be supposed to fill up all the space so that the molecular density may be taken equal to 1. When these values are substituted in the above equation we obtain, N $N = 6.05 \times 10^{23}$. This is the exact number of molecules which is known to be in 18 grams of water. It is the same

for *m* grams of any substance and is known as Avogadro's number. While the existence of this number was discovered more than a century ago its actual value has only recently been determined. By using a method totally different from the one described above Millikan obtained the value 6.065 x 10^{23}; Perrin likewise by another method obtained a somewhat larger value. Now the writer also found that in the case of nine other liquids the method of coalescence gave results of the same order of magnitude as water. It is difficult then to escape the conviction that the law of coalescence which never fails to act for all visible liquid spheres is effective down to the last two molecules.

From this there seems to be no alternative but to regard the latent heat of steam as the potential surface energy of the free molecules of which the steam is composed. Few laws in the physical world rest upon so solid a foundation. It necessarily follows (1) that free molecules possess surface tension which is somewhat greater than that of the liquid into which they condense, (2) that each free molecule carries a definite amount of potential surface energy equal to mLJ/N ergs which it cannot give up so long as it does not touch another, and (3) that when they suffer an impact they do not rebound like rubber balls but attach themselves to each other by means of their surface forces which on account of their relative velocity being too great allows them to separate again with their total kinetic energy unchanged.

This law may be further illustrated. In 18 grams of liquid water which is composed of six hundred thousand billion billion molecules there is only 33 sq. cm. of exterior surface. To convert it into steam will require 8,978 calories of energy. The separated molecules will then have a total surface area of 69.7 acres and will be loaded with precisely 8,978 calories of P.S.E. Now, we may suppose that when these molecules coalesce they go; first, all into groups of two; secondly, the groups of two into groups of four; thirdly, the groups of four into groups of eight; and so on. Then this process of pairing would occur 79 times, (not more), before the steam would become a single mass of water. The changes in surface area and in P.S.E. are given in the table below.

Order of pairing.	Reduction of Surface in acres.	P.S.E. changed to heat, in calories.
1	14.5	1847
2	11.5	1466
3	9.11	1163
4	7.23	934
5	5.76	733
6	4.56	582
7	3.62	462
8	2.88	366
9	2.28	291
10	1.81	277
Total for first 10 orders	63.24	8071
Bal. for rem. 69 orders	6.50	907
Total for complete cond'n	69.7	8978

Again to use Professor Boyle's illustration, the heat produced in 1000 cub. ft. of air containing 120,000,000 fog particles, which condense into 1/150 ounce of water amounts to 9,500 ergs; but the heat produced in forming the fog particles from the molecules amounts to nearly 3,930,000,000 ergs, or 48 calories.

It is the writer's desire to discuss the distribution of this energy in the August issue of *The Journal*, if space permits.

Sincerely yours,

WILSON TAYLOR, B.A., Associate E.I.C.

The Art of Rapid Computation and Science of Numbers

J. W. Harris, C.E., M.E.I.C., has prepared a small book in which are collated, in the most comprehensive manner, many useful rules of mathematics, embodying time saving devices which should be of great value in every office in which rapid calculation is a factor of efficiency. Mr. Harris, who has been for many years Assessment Commissioner of Winnipeg, has combined in this book not only the easy solution of the mathematical problems with which his assessment work brought him constantly in contact, but also problems encountered in almost every phase of modern business. The text is divided into four sections; first, "General Text", in which the fundamental principals of the subject are reviewed and each step of the familiar text books on arithmetic is explained with definitions, examples, and rules for eliminating much of the usual tedious work; second, "Commercial Section", in which all phases of financial mathematics are treated; third, "Technical Section", in which are given tables of the various systems of measurement together with essential data required in every branch of engineering; fourth, "Miscellaneous Section", in which, as the title implies, the author has compiled a large and varied assortment of problems extending over a wide range of subjects.

Research Develops New Use for Canadian Wood

Many people when passing a shop where automobile storage batteries are sold must have noticed in the window one or two batteries cut open to show the interior construction. These sections show the edges of the lead plates used in the battery and between the plates very thin corrugated sheets of wood. These sheets are known as separators and while perhaps appearing relatively unimportant have in fact been the subject of extensive research.

Wood for battery separators must possess special chemical and physical properties and until very recently the wooden separators used in Canada were made almost exclusively of imported woods. The Forest Products Laboratories of the Forestry Branch, Department of the Interior, recently undertook research to determine whether any Canadian wood was suitable for separator work, and as a result found a most excellent material in the yellow cypress of British Columbia. This wood was found to possess the requisite properties to a high degree and is now in regular commercial use for the manufacture of separators.

Preliminary Notice

of Applications for Admission and for Transfer

19th June, 1922

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in July, 1922.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option, Railway, Municipal Hydraulic, Mechanical, Mining or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects, Geography, History (that of Canada in particular), Arithmetic, Geometry, Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits scientific acquirements or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ALLEN—HAROLD A., of St. John, N.B. Born at Millville, N.B., Aug. 7th, 1889; Educ., I.C.S.; 1916, foreman bldg., constrn., licensed by the city of Boston bldg., dept., 1917 designed and constructed the ways for side launching Marine Constrn. Co., St. John; 1918, plant constrn., Imperial Oil, St. John; 1919, Engineers and Contractors, Ltd., St. John; 1920, J. A. Grant & Co., St. John; 1921, Lock Joint Pipe Co., St. John; at present designing and contracting, Allen & McCaw, St. John, N.B.

THE ENGINEERING INSTITUTE OF CANADA

INCORPORATED IN 1887 AS

THE CANADIAN SOCIETY OF CIVIL ENGINEERS

ENTERED AT THE POST OFFICE, MONTREAL, AS SECOND CLASS MATTER

VOLUME V MONTREAL, AUGUST 1922 NUMBER 8

British Columbia Professional Meeting

Vancouver B.C., June 16th and 17th, 1922.

Held under the auspices of the Vancouver and Victoria Branches

Vancouver offers facilities for a convention surpassed by no city on the continent and the natural advantages, with which were included ideal weather, combined with the native ability and energy of our Pacific Coast engineers, provided a gathering to be remembered with pleasure by all who attended. Great credit is due the men responsible for the detailed arrangements. Due to the courtesy of the Canadian Pacific Railway Company, an ideal assembly hall was available and at the disposal of *The Institute* during the convention, in the lower dining room of the hotel Vancouver.

Major George A. Walkem, M.E.I.C., Vancouver councillor, occupied the chair at the opening session at nine thirty a.m., Friday, June sixteenth, and extended a hearty welcome to all out of town visitors to Vancouver, giving a brief outline of the agenda for the day. Major Walkem then introduced Mayor C. E. Tisdall of Vancouver, who extended a welcome as follows: — Major Walkem and Gentlemen: It forms part of my duties to open conventions and I am particularly pleased to be here to-day because I realize that to no branch of men and no profession, is the west more indebted to than the engineering profession. Our city of Vancouver would not be here at all were it not for the engineering skill displayed in putting the Canadian Pacific Railway through the canyons of the Fraser, and I am glad to see in our midst to-day one of the men responsible for driving the rails through that celebrated piece of engineering work. I have looked through the programme for to-day and I hope that your deliberations will be of interest to you and I can assure you that in a social way you will be made particularly welcome to the city. I trust that the social side of your visit will leave pleasant recollections of Vancouver and I feel sure, with the beautiful weather that we have to-day and the weather that will continue for some little time, will be appreciated by you and will leave nothing but pleasant memories. I regret that my appearance this morning will not allow me to stop to hear the paper on town planning, on account of my colleagues being at the Good Roads Convention and some who are going to Portland next week. I am glad that town planning is being taken up by the engineering profession because there is ample scope in that direction. I welcome the engineers of Western Canada because they aid production and help us and assist us in an economical sense. I have only to say in conclusion on behalf of the city of Vancouver, how much we appreciate the honour you have done us in holding your convention here and to again

express the wish that you will have nothing but pleasant recollections of the convention here and of the social advantages of the city and the climatic advantages, and to assure you, if you ever decide to meet again in Vancouver, how cordially you will be welcomed and how glad we will be to see you all. I thank you.

The chairman thanked Mayor Tisdall for his sincere welcome and his appreciation of the engineering profession. He announced that the noon luncheon would be a joint luncheon of the Canadian Club of Vancouver and *The Engineering Institute,* addressed by the Honorable J. L. Perron, Minister of Roads, Province of Quebec, and that a group photograph would be taken on the court house steps immediately after the luncheon.

Vice-president Arthur Surveyer, was then asked to take the chair. Mr. Surveyer expressed his thanks for the honour, stating with his usual modesty that he felt

CHAS. BRAKENRIDGE, M E.I.C.
Chairman of the Vancouver Branch.

that the honour was not his as an individual, but as a representative of the Council of *The Institute.* Like all others who visit Vancouver, Mr. Surveyer spoke of the pleasure it gave him to be again in Vancouver, and paid a tribute to the kindness of Vancouver engineers.

Town Planning in British Columbia.

The chairman regretted the absence of James Ewing, M.E.I.C., of Montreal, the author of the opening paper, referring to him as one of the foremost exponents of the town planning idea. Chas. Brakenridge, M.E.I.C., chairman of the Vancouver Branch, then read Mr. Ewing's paper, "The Engineer and the Town Plan." Following the reading of the paper, which is published in another section of this *Journal,* discussion was given by H. M. Bigwood, A.M.E.I.C., secretary of the Victoria Branch and by W. B. Young, A.M.E.I.C., designing engineer, city engineer's department, Vancouver, both of which appear in the general section. In concluding Mr. Young referred to the work being done by the Board of Park Commissioners of Vancouver, saying that much was due them for the excellent state in which Stanley Park was kept and for the way in which it is controlled, the natural features of the park being maintained and at the same time provision being made for recreation grounds.

In the absence of W. B. Greig, A.M.E.I.C., municipal engineer, Point Grey, Major Walkem who is a councillor of the municipality, added to the discussion by pointing out what had been done in the way of town planning in that municipality. The provincial government was being urged to appoint a technically trained man whose profession was town planning, to draft an act applicable to the province of British Columbia, and he hoped that

P. PHILIP, M.E.I.C.
Chairman of the Victoria Branch.

a town planning Act would be drawn up under such auspices that the province would get the benefit. Continuing Major Walkem said: — "We have had some town planning in British Columbia. For the benefit of you gentlemen who are not residents of Vancouver I might say that pretty nearly all Vancouver, the present site of Vancouver, was owned by the C.P.R., in the old days. They did not do any town planning in Vancouver proper, but immediately on the outskirts to the south they developed a place called Shaughnessy Heights. They town-planned and contoured the streets and made a residential district of it. Eventually they turned that district over to the municipality of Point Grey with the improvements, which improvements cost the municipality far less than if the municipality had to do that themselves. Immediately to the south of that they opened another district which we call Shaughnessy Heights No. 2, and they

developed it in the same way, made nice wide streets, put in boulevards, cement walks, sewers and water pipes and everything, and they turned that over to the municipality of Point Grey absolutely free; that is, they saved the municipality of Point Grey an expenditure of perhaps a couple of millions of dollars and gave the people who purchased property there a fine site for residences and absolutely satisfied them so that they were willing to pay the increased price which enabled the C.P.R. to turn it over free to the municipality. That is one of the benefits of town planning and what Mr. Ewing refers to in his paper. In old Shaughnessy Heights I think the cost of development of a lot with 50 feet frontage is roughly $900 per lot. These figures are approximate, they are not accurate. In a section developed, and put on the market by the provincial government, a section of the city supposed to be for workmen's residences and laid out on the old rectangular system, a system which in England the government would not allow to be developed, practically a swamp, ward eight in this city, I think the cost per 50 foot lot ran up to over $2,000. You see how much cheaper it was to develop on the town planning system than the old rectangular system. I hope the discussion will be very full on this question because it is a question of vital importance to British Columbia."

P. H. BUCHAN, A.M.E.I.C.
Secretary-Treasurer of the Vancouver Branch.

HORACE M. BIGWOOD, A.M.E.I.C.
Secretary of the Victoria Branch.

Brig.-Gen. C. H. Mitchell, M.E.I.C., vice-president of *The Institute*, on being asked to add to the discussion, stated that he had been particularly interested in town planning for many years and was pleased to note that this subject was given the honour of being the first paper presented at the meeting. He thought that there were four headings in which the engineer should be interested in this subject. The first, what nature had done, second, what can be done by legislation, third, what a technical man could do in town planning, and fourth, what we as citizens could and ought to do to help. From the viewpoint of what nature had done he considered that in Vancouver and Victoria, with their wonderful scenery, their natural advantages should be availed of in this connection. Regarding legislation he suggested provincial legislation, whereby municipalities could take advantage of conditions to bring about good town planning. Ontario had been developing legislation and while not yet all that might be desired, it is progressing. He suggested the studying of legislation in other provinces. The literature on town planning was becoming extensive and could be used by engineers in its application to local conditions. As citizens, General Mitchell felt that the members of the engineering profession had not taken sufficient part in public affairs although in this subject we were particularly adapted by experience and education to take an active and progressive part. People were looking to the engineering profession to help in the question of town planning. In closing General Mitchell gave expression to his feeling that it was the duty of the engineer to assist in town planning in a more active manner, reflecting credit on the profession and adding to the beauty of the cities and the country.

Major J. A. Duchastel, M.E.I.C., chairman of the Montreal Branch, and chief engineer and city manager of Outremont, brought the greetings of the Montreal Branch to the meeting. Referring to the subject of town planning he mentioned the assistance to Vancouver and Victoria of having available luxuriant vegetation and the spirit on the part of the people in cultivating flowers and beautifying their homes. Conditions were different in Montreal as public property was largely

covered by pavements. In the city of Outremont town planning was being carried on with success. He was pleased to note the interest the engineering profession was taking in the important subject of town planning. He thought engineers, as citizens, could do much to reinforce and back up the work of municipal engineers. He regarded town planning, not merely a question of the development of playgrounds, the opening of parks and the beautifying of certain streets, but a rational development of the whole city plan and a subject in which the engineer could find a great deal of work, in fact a life work, in its application to the development of municipalities and cities. The chairman speaking as a citizen of the city of Outremont stated that they considered it was the best managed municipality in Canada.

A. F. Macallum, M.E.I.C., commissioner of works, of Ottawa, who was the official representative of the Ottawa Branch and also representative of the city of Ottawa at the Good Roads Convention, was asked to add to the discussion. He stated that the unfortunate part of town planning was that it had been sprung upon the profession by unprofessional people in an unprofessional manner. In some districts in the United States it was looked upon as a joke. In the city of Ottawa they had a federal plan drawn out in an artistic manner, but he thought it was to some extent impracticable because it would cost the city fifty or sixty million dollars to carry it out. In time, however, part of it could be carried out. They are now working together on practical details. In one district an elaborate scheme was gotten out as far as streets were concerned, but they did not take into account the fact that it was necessary to install water works and sewers. He instanced the economy of having alley-ways in a city. In garbage collection the cost being forty per cent more to collect garbage where there are no alley-ways. In a city of one hundred thousand population it would cost fifty-two thousand dollars to collect the garbage if alley-ways were provided, and eighty thousand dollars without; the difference representing the interest on half a million dollars. That was a practical detail that was not always considered. He spoke of the lack of a civic centre in Vancouver; the badly laid out city of Montreal, Toronto being worse, where there was need of practical town planning.

Professor Peter Gillespie, M.E.I.C., was asked to discuss the subject. He pointed out that one of the perplexities of town planning was the uncertainty of the growth of the population. He referred to an estimate of the population of Toronto made by a British expert in 1896, of three hundred and fifty thousand in 1940, whereas the present population is five hundred and fifty thousand. It required men of vision and special knowledge to enable them to solve the problems. Professor Gillespie told of the lectures given at the University of Toronto, to men whose employment was related to the government administration. The subjects discussed were, transportation, water-supply, sewerage, public health; and it was gratifying to know that in the opinion of those connected primarily with the course and those who observed its progress, that it was a very substantial advance in the direction of interesting the people in the province in town planning.

Major Walkem said he wished to put in a word for the real estate men. They are generally accused of caring for nothing except getting the dollars. Such was not the case in Point Grey, where real estate men were the keenest on town planning and, with the members of the real estate exchange of Vancouver, had sent delegation after delegation over to Victoria to interview the government in the interests of town planning.

Announcements

As there was no further discussion on the subject the chairman called on Fraser Keith to make some announcements. Mr. Keith said: — "Our President, Mr. J. G. Sullivan, of Winnipeg, has asked me to convey his very sincere regrets to you because he was unable to be present. Mr. Sullivan asks me also, in expressing his regret, to extend to you on his behalf a very cordial invitation to be present at the Winnipeg meeting. The invitation was extended from Winnipeg at the time of the annual meeting in Toronto last year, and the Winnipeg members have been making plans for a year and a half for a successful convention and it is hoped that a good many from the coast will be there. The meeting is on September 5th, 6th, and 7th." He read a letter from H. G. Wright, president of the University Club, extending the privileges of the club to all outside members of *The Institute*, stating that the club would be glad to make any special arrangements for the comfort of the members. He suggested that in view of the fact that no special arrangements had been made for dinner it would be advantageous if as many as possible would meet at six thirty at the University Club where a special table would be provided for as many as would care to come. He mentioned that an invitation was received for all members who desired to take an automobile trip through the Okanagan valley, as guests of the Boards of Trade of the interior cities, from Kamloops through the Okanagan valley and through the boundry country, Crow's Nest, Watertown lakes to Lethbridge and up the Windermere valley.

Luncheon

The meeting then adjourned to a joint luncheon with the Canadian Club of Vancouver in the hotel Vancouver, the speaker of the day being the Honorable J. L. Perron, Minister of Roads, Province of Quebec. Mr. Perron who had come west to attend the Good Roads Convention, gave an eloquent address on the subject of good roads, pointing out the practicability of a highway across Canada by the co-operation of the various provinces and the utilization of provincial roads for that purpose. He made the important announcement that the contracts were being let for a bridge across the Ottawa connecting Montreal with the mainland and that the near future would see a first-class highway connecting Montreal and Toronto. At the conclusion of the luncheon a group photograph was taken on the court house steps.

Visit to Ballantyne Pier

Following the luncheon with the Canadian Club, the members were taken by automobile to the ferry wharf for the purpose of visiting the Ballantyne pier and the

construction yards on the north shore, through the courtesy of A. D. Swan, M.E.I.C., and Wm. Smaill, M.E.I.C., chief engineer Northern Construction Company. At the ferry landing a tug and scow kindly supplied by Major Walkem, M.E.I.C., awaited the party, which was conveyed to the north shore, and an inspection made of the concrete columns and forms undergoing construction, to be used in the Ballantyne pier. The special phases of construction embodying the latest methods were pointed out, the product being of a very superior order. Following the visit to the construction yards the party was transported across the harbour to the pier, where many expressions of commendation were heard on the design and quality of work being carried out.

Irrigation in British Columbia

The evening session commenced at eight thirty p.m., the chair being occupied by Brig.-Gen. C. H. Mitchell, M.E.I.C., vice-president of *The Institute*. Owing to the fact that there had not been sufficient time for the paper on "Irrigation in British Columbia" at the morning session it was postponed until the evening. The chairman on opening the meeting called upon E. A. Cleveland, M.E.I.C., consulting engineer to the Department of Lands, Victoria, who read his paper, "Irrigation in British Columbia". This paper is published in the general section of this issue of *The Journal*. The discussion on irrigation took place at the morning session, Saturday, June seventeenth. Chas. Brakenridge, M.E.I.C., chairman of the Vancouver Branch, occupied the chair. P. J. Jennings, M.E.I.C., chairman of the Calgary Branch, acting assistant commissioner of irrigation for Alberta and Saskatchewan opened the discussion by complimenting the author on his excellent and interesting paper. He asked the author how the figures of the duty of water as set, of two and a half cubic feet per acre, obtained. Replying, Mr. Cleveland stated that the duty set at two and a half acre-feet was the general duty set for the granting of licenses for irrigation purposes regardless of the place. This was done to arrive at some general duty under which the board could allocate water to the various licensees. There was no scientific precision or accuracy for the setting of that duty; the experiments of the duty of water so far being more or less of a primitive kind. Mr. Jennings stated that in Calgary applications are received on streams which flow with a tremendous volume of water for a short period and all they give by grant is eight inches of water instead of the full eighteen inches, because storage is unavailable. Continuing in the discussion Mr. Cleveland stated that an apparent misapprehension exists, as to just where the duty of two and a half acre-feet applies, being the duty that a man might be allowed under a license, but it need not follow that that is all that the individual user of the water gets. The duty of two and a half acre-feet is the amount the company or district are entitled to take in general from the source of supply and they distribute it according to the needs of the user. Mr. Jennings suggested the difficulty there must be to administer a stream if on any one area a certain duty of water is required and in another area a different duty. The author pointed out that it is the business of the irrigation engineer to allocate the water and to introduce such rotations as are necessary, but to allow each his proporation of duty assigned under the license. When a company or district takes water from a creek or river the distribution, by them, to the users under them, is entirely a matter of interest to them and generally governed by agreement. In districts formed in the last two years the use is governed by officers in the district. He further explained that in the early days of irrigation the subdivider of the land sold the land subject to an agreement. This system had not been maintained. It was found that the works were obsolete and out of date in a few years. Mr. Jennings explained that the financial standing of the company was investigated before a grant was made, that the agreement made must be satisfactory to the government, and the land declared suitable and capable of carrying the water that the prospective enterprise has undertaken to deliver. He requested information as to the difference between an irrigation district and a water users' community, being told that a water users' community is an elementary and fundamental form of co-operative effort in a community. It might be called an association of neighbouring farmers, or orchardists, who have their own supply. Mr. Jennings thought it a hardship to have the water shut off as it eliminated the prospect of getting the taxes due, but Mr. Cleveland stated that this was the first year it was being tried in order to stimulate promptness and have every man assume his share of the burden. He mentioned further that the banks were helping finance the fruit growers. Speaking of the Federal side of irrigation, Mr. Jennings mentioned the eastern section near Calgary, which is hardly ten per cent settled, being in large areas; the Lethbridge Northern, under Mr. Muckleston, the United Irrigation District, the Macleod Irrigation District; the important problem being to get the people on the land. Holdings were being cut down from four hundred and eighty and six hundred and forty acres in dry areas, to eighty to one hundred, and one hundred and sixty acres under irrigation. In the Irrigation Department at Calgary, Mr. Jennings explained they have drainage basin records for ten years and thus have a fairly accurate run per acre-foot.

Major H. B. Muckleston, M.E.I.C., chief engineer, Northern Irrigation District, explained the process by which the irrigation districts are formed in Alberta, it having gone through the same stage as in any other country, the first stage being development on a small scale by individuals; the second, a partnership where two or three built a system; the third stage was the corporation system lead by the Canadian Pacific Railway Company, the last stage being by districts formed for development. He stated that no corporation would build an irrigation system because there was no money in the actual irrigation part of it, the process of irrigating the land taking such a long time that the accrued interest mounts up to a heavy capital charge. The form now in vogue was the irrigation districts. Any group of farmers may form themselves into a district. Generally some enthusiast secures signatures to a petition addressed to the Alberta government. The Minister of Public Works appoints a day on which an election is to be held and appoints a returning officer whereupon trustees are elected to carry on the affairs of the district and, after

the election being declared valid by the Minister of Public Works, the trustees must immediately appoint a secretary and a district engineer. The district engineer must be a member of the Association of Professional Engineers of Alberta. The engineer is then required to estimate the cost of the development of the irrigation district. When that is approved by the Minister, the second election is held in which the land holders vote as to whether or not they are willing to bond their land to the extent of the estimated cost. "If that vote carries," said Major Muckleston, "the estimate is placed again before the House in Alberta, and if it is favourably considered by the House, the province underwrites the bonds, guarantees the bonds, but it does so on two conditions; one condition is, that all land owned by any individual in excess of one quarter section, containing more than 160 acres of irrigable land, must be listed for sale, and sold, and when that is done the province will sell the bonds and construction begins. The province does not allow the fault which killed nearly every irrigation work in Alberta, and that is farming too much land. It is considered better to farm an acre thoroughly, than to farm two acres. The experience in connection with irrigation in Alberta would prove that. The first system built was unfortunate in the beginning, it was a long way ahead of its time. The first district formed under the Act was the Taber District, with 17,000 acres of irrigable land. They were lucky in having the C.P.R., do the job for them and take the bonds in payment, and after their first year's operation Taber District came through and every cent was paid off. Last year, the second year, their dues were paid without any recourse to the penalties which the Irrigation Districts Act provides.

In regard to the financing of the district after the construction and operating expenses are met, each year the Board of Trustees must prepare what is known as an assessment. They make an estimate of what the annual operating and maintaining charges are to be and to that they add the interest and cost of construction, and whatever sinking fund there may be for the debentures. They issue a notice in December to each ratepayer saying that his assessment for the coming year is so much. He has then until February to come in and pay the money. If he does not pay it by February he gets another notice and he has one month in which to pay the ten per cent value and if he does not the Board of Trustees put a notice in the Land Titles office and that man's land reverts to the district. They expropriate the land for delinquent taxes; they simply take the land. I think that is all I have to say."

W. B. Young, A.M.E.I.C., stated that it was interesting to note that in 1912 Mr. Dennis of the Canadian Pacific Railway Company, Mr. Fulton and Dr. Fortier of Washington, Sir William Wilcox and many other prominent men met in Kelowna, the report of the discussion being on record in the Western Canada Irrigation Association's book, marking a distinct step towards the solution of the problem with which water users were faced. Out of that came the first Act, the Irrigation Incorporation Act, but because of the lack of power or authority to the Minister of Lands and the comptroller under the Water Act, they were not able to make progress. In 1917 the present legislation was passed. Mr. Young outlined some instances leading to the change in the Act, the difficulty of financing, and paid a tribute to the early companies who had done much for the valley.

Referring to the bonds sold by irrigation districts in Alberta, Mr. Muckleston stated that they were an absolute first mortgage and held priority to any claim except that of the Crown, taking precedence to mortgages, seed liens, and any other encumbrances.

E. G. Marriott, A.M.E.I.C., Water Rights Branch, Victoria, being called upon by the chairman, mentioned the vital importance of irrigation and water to the products of British Columbia, as the possible future development of the city depended on the water. The solution of the use of the water being an engineering matter it was necessary that engineers should take every interest by familiarizing themselves with the Water Act, mentioning that copies were available on application.

Logging in British Columbia

Following the reading of Mr. Cleveland's paper, Chairman Mitchell called on Capt. T. W. Fairhurst, A.M.E.I.C., sales engineer, Vancouver Machinery Depot, who then read his paper, "Professional Engineering in the B. C. Logging Industry," published in the general section of this issue of *The Journal*, which as he explained was for the purpose of showing the history and advent of the professional engineer as applied to the logging industry in British Columbia.

Major Geo. A. Walkem, added to the discussion by stating that Capt. Fairhurst had brought the logs from the trees to the water, and he would explain how the logs were then brought to Vancouver, being boomed in rows of forty or fifty feet wide and boom sticks put around the outside and swifter sticks put on top at intervals. It is possible for tugs, used for towing the logs, to operate only in good weather as a sea will cause the logs to jump the boom sticks, the tugs standing the weather better than the raft. Towing is now carried on from a distance, he mentioned one instance of towing from Queen Charlotte to Anacortes. The best weather for towing is July and August. If logs are put in the water in March the teredo has them riddled before they could be towed to the mills. Nowadays the Davis system is used, being a cigar shaped raft with cables wound around. Major Walkem narrated some of the early experiences of logging in British Columbia and the difficulties encountered, stating that the engineering part of it was one of the most interesting phases of engineering that he had had anything to do with.

Continuing Mr. Walkem said, "When locomotives came out first, they used only the steam jam. There was no means of putting a brake on the trucks and the steam jam was sufficient for the locomotive and it was not necessary to use the engine as a compressor because you could block the wheels with a steam jam, but owing to the number of accidents they had created a Department of Railways, in British Columbia, whose functions—because they have no jurisdiction over roads with Dominion charters — is to deal almost entirely with logging

railways and locomotives. They got out a drastic set of rules prohibiting the use of disconnected trucks. That is, only a small percentage of disconnected trucks could be used; the others being replaced by skeleton cars. These were really pairs of trucks, but they were coupled together with the timber. On the bottom of the timbers were mounted the regulation Westinghouse air brakes, such as are used on the main line. To operate these you had to have an air compressor on the locomotive, and this air compressor could not be used for the locomotive; the theory being that the compressor on the locomotive was used on the cars alone and the engine itself was taken care of by the steam jam. If the man pumped up his air and thought he would try to handle the entire load with his locomotive, without having air sufficient to give his train a shot of air, if he started to go down a heavy grade, he must always keep his compressor pump up, so that his train does the braking and not the engine. That was a fruitful source of accidents in the old days, that is when they used the steam jam and not the air on the cars and consequently, in a pinch, a train was too heavy and simply jumped on and pushed the engine ahead and a wreck resulted. The inspectors will not allow the locomotive to take any of the braking work. If the inspector finds out he is trying to control the train with the weight of the engine and the steam jam he will cancel the engineer's certificate.

Mr. Mucklestone: That seems to be the opposite to the practice of the C.P.R. on the Field hill. They had to adopt the opposite practice. The theory was that anything a locomotive could pull up a steep hill they could pull down. The air brake was cut off at the tender and the whole thing was controlled by reversing the engine and putting a small jet of steam into the cylinder and the load was brought down by the engine acting as a compressor. When the train left Stephen the air brakes were cut off at the engine and it was brought down by the locomotive alone.

Mr. Walkem: That is absolutely contrary to the practice and the present superintendent of railways for British Columbia, at least the head of the Department of Railways, inspection department, is an old C.P.R., man, who spent most of his life on the C.P.R. and on his recommendation that part of the Act was drafted.

Mr. Lloyd: That difference might be due to the ratio of weight of a C.P.R. locomotive to the train, but there is quite a difference in the ratio of weight between the engine and a logging train.

Mr. Mucklestone: It was not on account of ratio of weight of the locomotive, but the reason behind it was the heating of the car wheels, the friction on the brake shoes over that nine miles of grade. They found by bitter experience that the tires came off the wheels sometimes.

W. H. Powell, M.E.I.C., asked the author the cost of a system of spar poles and head wire, stating that he understood it was from sixteen to twenty-five thousand dollars, to which Capt. Fairhurst replied that that was the cost with the engine included, seven or eight thousand dollars paying for all the rigging up to three thousand feet, being an approximation. To use duplex aerial skidders the outlay would cost twenty-nine to thirty thousand dollars. In answer to the question of the average weight of the logs pulled into camp he replied that they run from three thousand to ten thousand board feet per log and weigh up to five tons. In reply to a question from Capt. Everall, Capt. Fairhurst stated that an electric unit was equivalent to a steam unit, there being little difference, but that with an electric unit there would be a great saving in labour cost. H. P. Archibald, A.M.E.I.C., of Vancouver, outlined the old method of chuting the logs down a V-shaped chute which might be three-quarters of a mile long, water being turned on in many cases to prevent their taking fire owing to the friction of a heavy log going down a forty per cent grade. The meeting then adjourned.

Institute Affairs

Following the discussion on irrigation and before commencing the discussion of the affairs of *The Institute* as outlined in the programme, Chairman Brakenridge, expressed his gratification on seeing H. J. Cambie, M.E.I.C., present at the meeting; Mr. Cambie being undoubtedly the pioneer engineer of British Columbia. He extended him a hearty welcome and wished him many years of happy life, all present endorsing the chairman's suggestion by applause.

Institute Policy

It being now ten minutes past ten the chairman announced that the three speakers would have ten minutes each, leaving more time for discussion. He called upon Major W. G. Swan, M.E.I.C., who gave a discussion on the report of the committee on Policy published in the June *Journal.*

Major Swan mentioned having attended a meeting in 1910 and again in 1919, the Ottawa convention, and he found that in the meantime a new organization had sprung up being the result of the work of the committee on Society Affairs, under Professor H. E. T. Haultain, M.E.I.C., resulting in the change of name and the adoption of a broader policy. He pointed out that the present committee on Policy recommended a still further broadening of the objects of *The Institute,* enumerating them as follows: — (a) To develop and maintain high standards in the engineering profession. (b) To facilitate the acquirement and the interchange of professional knowledge among its members. (c) To promote the professional, the social and the economic welfare of its members, as may be deemed necessary for the maintenance of the honour and dignity of the profession. (d) To enhance the usefulness of the profession to the public, to make known its value, and to indicate means whereby it may be of service. (e) To encourage the establishment and the maintenance of appropriate educational facilities for the training of engineers. (f) To promote intercourse between engineers and members of allied professions, and to co-operate with other societies in broadening the usefulness of the profession. (g) To encourage original research, and the study, development and conservation of the resources of the Dominion.

Continuing, Major Swan discussed the report, as previously published for the benefit of the members, and

in some instances pointed out the reason for the conclusions arrived at by the committee. Before concluding Major Swan moved the following resolution:—

> THAT this meeting go on record as endorsing the proposals of the Committee on Policy as embodied in the report, pages three hundred and twenty-nine to three hundred and thirty-five of the June issue of The Engineering Journal.

Seconding the motion A. E. Foreman, M.E.I.C., a member of the committee, pointed out the important work done by the committee and the data and information collected, the published report being the result of a meeting in Montreal. There being little discussion the motion was put to the meeting and carried unanimously.

Legislation

Patrick Philip, M.E.I.C., chairman of the Victoria Branch, discussing the problem of securing adequate recognition for the engineering profession, expressed his belief that adequate legislation was a means towards that end and mentioned that legislation now existed in every province except Saskatchewan, and further, believed that it would be necessary to secure Dominion legislation and that could be effected by the active co-operation of the E.I.C. He quoted President Sullivan, in his address before the Victoria Branch as stating his belief that some day Dominion-wide legislation would be effected. Referring to the medical association with a Dominion-wide Act, he believed that engineers should have the same status. Mr. Philip moved the adoption of the following resolution:—

> THAT this meeting considers the subject of legislation of great importance to the profession and would advocate its inclusion in any statement of policy adopted by the Institute.
>
> It also suggests that the Institute by its action in launching the campaign for legislation, is the organization which can logically claim to be entitled to continue the excellent work already done, and to strive for co-ordinated legislation throughout the Dominion. Further, it is asked that this resolution be published in The Journal.

The motion was seconded by Wm. Smaill, M.E.I.C.

Secretary Keith stated that *The Institute* had not taken any active steps with regard to legislation in the various provinces. He outlined the history of the movement to secure legislation. A committee had been appointed consisting of representative engineers from all over the country who met at Montreal and decided to recommend that legislation be secured in the various provinces along the line of what was called a model Act. This was placed before the engineers in the various provinces without prejudice and left to the engineers, both members of *The Institute* and members of other bodies, to deal with; resulting in legislation in all provinces but one. Referring to Ontario, he reviewed the history of the effort in this connection, in that province, the final chapter of which was contained in a telegram to him from Willis Chipman, M.E.I.C., under date of June twelfth: "Bill finally passed House June fifth. Registration only granted. Engineers may continue to practice without registration. More open than Alberta. Act passed House Committees twice without serious amendment but at final reading was badly mutilated. Will continue to carry on." He understood that in Saskatchewan it was the intention to make a further effort to secure legislation with the next change of legislature.

H. S. Carpenter, M.E.I.C., Deputy Minister of Highways, Province of Saskatchewan, spoke of the efforts made to secure legislation in Saskatchewan, they being the first to present a Bill on behalf of the engineering profession. Last winter a Bill had been brought down that had the support of the Premier and Ministers but not as a government Bill. It had been so badly mutilated that they decided to withdraw it believing that they could later secure the full measure of protection. It is proposed to keep the matter alive and any help that other provinces could give would be welcome.

Mr. Foreman expressed his belief that support should be given to the provinces which had not legislation, but he did not think that it would do any good at the present time to try to procure Dominion legislation.

Other discussion pointed out the difficulty, or importance of doing nothing with Dominion legislation until uniform provincial legislation had been secured.

Professor E. G. Matheson, M.E.I.C., reviewed the history of legislation in British Columbia at some length, suggesting co-operation such as was used in bringing about legislation in British Columbia.

Capt. Everall, referring to the recommendation of the committee on Policy, on more effective co-operation with sister bodies in Canada and the United States, believed that an omission had been made by not including the British Empire.

An amendment was moved by Major Swan, M.E.I.C., and seconded by D. O. Lewis, M.E.I.C.:

> THAT this meeting recommend to the Council of the Institute energetic action be taken to secure Dominion-wide legislation as soon as adequate legal protection to practice has been secured in all provinces.

The amendment was put to the meeting and lost, the motion was then put and carried.

Welfare of Engineers

Psychology

The welfare phase of *Institute* activities was introduced by D. O. Lewis, M.E.I.C., who discussed it under the headings, of psychology, publicity and legislation. Dealing with psychology, or personal attitude in relation to the engineers' welfare, Mr. Lewis pointed out in no uncertain manner that the engineering profession had been directly responsible for the great advance of civilization, so that the poor man lives to-day in greater security and comfort than did the richest baron in feudal times. Yet on account of the fact that we have been too clannish, too narrow, and had not interested ourselves in the social, political and business welfare of the country, we had not received the recognition of which we were entitled. By becoming specialists and devoting our energies to a narrow field we had become animated tools working for the benefit of society and relegated through life to a subordinate relationship to the business man, who with a greater knowledge of men and affairs is able to dictate and control our field of action. Continuing, Mr. Lewis asked the question, are we playing up to our opportunities, to which he gave a negative answer, stating that if we aspire to a higher plane in society we must not only understand how

to direct the forces of nature, but we must also get what we want done and direct the doing. He advised, in addition to the study of dead worlds of matter and force, a study of the live issues of the country, where we could obtain a broader vision and cultivate more human interests and associations. It was necessary therefore to change our mental attitude before we could look forward to more beneficial results.

Publicity

On the subject of publicity Mr. Lewis pointed out that while good works spoke for themselves, generally speaking the engineer does the work, but as soon as it gets to a point where it is appreciated by the public, he is in the background and the talkative business man in the foreground. He believed we should have quiet publicity to give the public an idea of what we are doing, and the work we are doing, in a modest manner, then they would know who was doing it. Publicity that would let the world know definitely that what the engineer does is needed. He referred to the formation of an engineering luncheon club in Vancouver, at which engineers could lunch together, the idea being to interest people from other associations, such as the Rotary Club and the Kiwanis Club, and also have engineers talk to them.

Legislation

One of the most important things in connection with legislation, Mr. Lewis believed, was reciprocity both with the different provinces and with the United States, particularly the latter. It had been stated in British Columbia that mining investors would not take up propositions in the province if the Bill were passed, but provision has been made to apply to investors desiring to bring their own engineers. He mentioned an invitation from Indiana to reciprocate and believed that reciprocity would be a great advantage. (Applause.)

British Columbia Provincial Division

While this had been a subject before the members throughout British Columbia, Major Walkem, M.E.I.C., felt in discussing the subject, that in view of the recommendations of the committee on Policy whereby all members would be connected with Branches and thus be in closer touch with *Institute* affairs, the matter was not pressing and might well be laid over for a year. In view of the fact that the Branches were being given further freedom and more direct representation, the necessity for provincial divisions is not so great. After discussion on the subject by Messrs. Carpenter, Walkem and Keith, it was resolved on motion by Major Walkem, seconded by D. O. Lewis:

THAT the question of establishing a Provincial Division in British Columbia be dropped for the present

Motion carried.

The following resolution was presented to the meeting by Major Walkem, seconded by W. H. Powell, M.E.I.C.:—

WHEREAS this convention recognizes the growing importance of town planning, and

WHEREAS The Engineering Institute of Canada have for some time recognized town planning as a separate and exact branch of engineering, and

WHEREAS this convention believes the time is now ripe to urge upon the various governments, Federal and Provincial, the creation of departments, or machinery of some sort to supervise and carry out town planning, be it resolved, therefore;

THAT we urge the Council of The Engineering Institute to bring before the government the necessity of creating the department and appointing proper officials so that town planning will be given a place in the government that its importance entitles it to.

The resolution was adopted.

Resolutions of Thanks

At the conclusion of the discussion on *Institute* affairs, Major Duchastel moved the following votes of thanks:—(1) That the appreciation and thanks of this assembly be extended to the City of Vancouver, for the address of welcome from Mayor Tisdall, for the hospitality extended in the visit to the Seymour intake. (2) Vote of thanks to the C.P.R. officials for providing facilities for this meeting. (3) Vote of thanks to A. D. Swan, M.E.I.C., Northern Construction Company (Wm. Smaill, M.E.I.C., chief engineer) for the privilege of visiting the construction yards and the Ballantyne pier. (4) Vote of thanks to Major Geo. A. Walkem, M.E.I.C., for providing "safe" water transportation for the visit to the construction yards and pier. (5) Vote of thanks to the authors of the papers and those who prepared different discussions and took part in the discussions. (6) Vote of thanks to the University Club for extending their courtesy to the visiting members. (7) Vote of thanks to the owners of automobiles who kindly loaned their cars for the benefit of the members. (8) Vote of thanks to the committee and those who worked and made this meeting a success. Brig.-Gen. Mitchell, M.E.I.C., seconding the motion, that the above votes of thanks be passed, stated that those who came from a distance, particularly, appreciated all the attention that had been given. The votes of thanks were unanimously passed in one motion.

Entertained by City

The City of Vancouver, through City Engineer Fellowes and Alderman Col. T.H. Tracy, M.E.I.C., acted as hosts, on Saturday, when a party was entertained to luncheon at the water-works intake on Seymour creek. Leaving the hotel Vancouver at eleven thirty A.M. in twelve automobiles, the party crossed the inlet and proceeded up Seymour valley, stopping at various places to view the canyon. Dinner was provided at the big log cabin at the Scott ranch. A. F. Macallum, M.E.I.C., Commissioner of Works, Ottawa, expressed the thanks of the visitors for the hospitality of the City. Other speakers were Alderman Tracy, M.E.I.C., F. L. Fellowes, Professor E. G. Matheson, M.E.I.C., of the University of B. C., Col. G. K. Kirkpatrick, chairman of the Harbour Board, P. J. Jennings, M.E.I.C., Federal Irrigation Department, Calgary, Thomas White, M.E.I.C., engineer of the Canadian National Railways, Chas. Brakenridge, M.E.I.C., chairman of the Vancouver Branch of *The Institute.*

The Engineer and the Town Plan

James Ewing M.E.I.C.

Consulting Engineer, Montreal;

Vice-President, Town Planning Institute of Canada.

Paper Read before the British Columbia Professional Meeting of the Engineering Institute of Canada, Vancouver B. C., July 16th, 1922

The actual planning of towns and cities is a science to which municipal engineers as a rule have given far too little thought and attention, notwithstanding that it is the main governing and determining factor in their work. In the west especially, the pioneer influence of the railways is the prime initiator of the town and the city, and railroad economics, exigencies and requirements the paramount consideration. With the railway station as the nucleus of a rudimentary rectangular layout, the town is started off to grow and take care of itself in growing.

Then the real estate operator gets to work and takes a hand in the movement. Such notions as the development of the land to the best advantage and accommodation of the community are usually foreign to him. He is not interested in holding and improving the land but only in getting rid of it, receiving the biggest turnover in the shortest possible time. Therefore all economic, hygienic or aesthetic considerations are entirely outweighed by the easiest and cheapest layout that can be got.

When the town grows apace and aspires to the status of a city, the services of the municipal engineer is commissioned and in nine cases out of ten he accepts and falls in with the existing situation unquestioningly. He applies his knowledge and energies assiduously in determining the most efficient and economical design and construction of the necessary public utilities; he is most careful and painstaking regarding the source, distribution and treatment of the water supply, the correct grades and capacities of the sewerage conduits, as well as the ultimate disposal of the sewage, and the proper ingredients, handling of materials and most durable types of street paving. The basic question, however, of what a street is for, is seldom or ever entered into analytically, the present and prospective volume and trend of street traffic is usually disregarded, and the general development along rational and economic lines left uncontrolled until it becomes practically uncontrollable.

Perhaps it is hardly fair to put the blame on the engineer who generally speaking is asked to study and advise on certain phases of the subject and is paid for that, while unsolicited recommendations would be unappreciated and possibly even resented. The fault lies rather with the authorities who employ him, or with the taxpayers themselves who are always urgently clamouring to see something tangible for their money, but the misfortune falls on the entire town which forever afterwards must go on struggling under disabilities which could easily have been obviated in the beginning.

Importance of Planning for the Future

The great trouble is that the need for town planning is never imperative and seldom even apparent till its cost becomes prohibitive. It is only after most of the damage has been done, when the water and sewerage systems have been installed, pavements laid, tramways constructed, and many more or less valuable buildings erected, that the inherent weakness and sheer inadequacy of an ill-considered rule-of-thumb layout becomes evident. It will then be found in most cases that the main streams of street traffic have to follow along indirect routes over thoroughfares of insufficient capacity, with the principal crossings blocked and congested, notwithstanding the fact that at the same time there are plenty of other streets of extravagant width over which there is no traffic to speak of, and where it may be said that fifty per cent of the cost of paving those streets has been, both literally and figuratively, money thrown in the gutter.

Then too, the perilous and paralysing effects of the level railroad crossing assumes prominence, becoming a real calamitous condition calling loudly for redress. Soon also we find, owing to unregulated and uncontrolled development, the factories springing up promiscuously all over the place and spreading in their neighbourhood ugly, malodorous and grimy conditions, forcing up the cost of land but depreciating residential values with the inevitable consequence that buildings fall into disuse, decay and delapidation, and the foul reeking cankerous slum is created.

Following upon that a well defined movement is instituted from the centre towards the circumference of the city, first of the residences seeking more wholesome surroundings, followed by the shopping and lighter industrial establishments, and last of all by the factories themselves, who finding themselves cramped for elbow room and bereft of a nearby steady and reliable labour supply, start to get after it and begin to build up on the outskirts, there to create afresh new plethoras of slums. In this way a huge volume of really unnecessary street traffic is formed, under which the pavements soon crumble and have to be renewed, only to be torn up again in order to install larger and more adequate water, sewerage and power services to meet industrial requirements. Main thoroughfares must be widened at tremendous cost or new traffic avenues opened up. Building, tearing down and rebuilding becomes the order of the day, and so goes on the everlasting merry-go-round which leads nowhere, for the cycle is never completed. It is a constant ever widening spiral following along in a blind way without objective, and the waste is tremendous, the lost and dissipated effort incalculable.

This may be said to be a faithful picture of the history and condition of many a real live, progressive and up-to-date western town. Having arrived at the stage above described it might well be conceived to have learned its lesson and be prepared to mend its ways, but what was formerly a little playful calf has now become a ferocious bull that it requires some resolution to tackle. For unfortunately what was the easiest thing in the world at the commencement has by this time become practically impossible and can only be partially remedied even at tremendous cost. Difficulties that at first were only slight deterrents have kept on increasing not by simple progression but by ratio of squares and have assumed the proportions of insurmountable obstacles. The longer the delay the further and further the objective gets out of reach, until there comes a day when absolute dire necessity compels, and improvements and rectifications must perforce be made regardless of obstacles and regardless of cost, when millions can not accomplish what a few hundreds would have done in the beginning.

With all the talk about town planning in recent years, its real purpose is quite commonly misunderstood. The most widely prevailing and persistent misconception is that it has mainly to do with 'frills', and is linked up in the general mind with ambitious schemes of embellishment, stately and imposing civic centres, elaborate and extravagant boulevards, and parks and plazas resplendent with foliage, fountains and monuments. Now it should be clearly recognized that these things however nice in themselves are neither of major nor urgent moment, and if they come into it at all are merely incidental. It should be remembered that a city may have all of these things and yet organically be poorly planned, indeed some of them are often in themselves conspicuous examples of radically bad planning.

The Transportation and Street Traffic Problem

A city is not a mere indiscriminate collection of bricks and stones; it is a living breathing, pulsating organism like the human body, and a well planned city is one which performs its various complex and interdependent functions with the greatest ease and efficiency, and the least interference one with the other, or liability to interuption or breakdown. Just as in the human body, the most vital of all these functions is the circulatory movement, and if any part of it becomes impaired or congested the result is more or less general atrophy.

The transportation or street traffic problem is therefore of basic importance. Here it may be said that one can well imagine what would happen to the human body if all our veins instead of being proportioned according to the amount of work they are required to perform, into main arterial, secondary and minor distributary systems, were all about the same size. No engineer worthy of the name would think for a moment of designing water and sewerage services with pipes all of one dimension, and yet in making provision for our street traffic that is exactly what we do with our streets.

At the root of the traffic problem lies the railroad transportation question, and it is all the more important because it is the rigid framework affecting and governing all the rest. In the West more especially, the railways have the advantage usually of having got there first, or at least one of them has, and if the town shows any disposition to grow or become a progressive centre, we may be quite sure that other competitive roads will follow, each of course wanting to come in over its own right of way, and generally about the same level as that of the streets. So we frequently find these rival roads with their subsidiary and connecting spurs forming together a regular network of tracks, paralysing the street traffic and compressing the very vitals of the city in a grip of steel. It is futile to expect any healthy vigorous movement or progress under conditions like that, since what should be designed as the useful and helpful adjunct of the other are in perpetual self destructive conflict.

Railway transportation in the city is therefore the primary problem confronting the town planner, and the unification of roadbeds, if not of tracks, as well as the separation of grades to the greatest possible extent, of the utmost moment. Experience has abundantly proven the entire futility of approaching a serious and complex subject like that in a fractious or contentious manner. The solution, or partial solution, for it is at best a matter of compromise, can only be arrived at with the help of the railways themselves, each interest joining in a co-operative and conciliatory spirit for the ultimate benefit of all concerned.

Zoning

Next to the railroad transportation question is the problem of "zoning", or "districting", as some prefer to call it, in such a way as to afford protection to the residential element and at the same time give the utmost facility for the carrying on of manufacturing, industrial, and commercial operations, for these are the bones and sinues of the city corporate, without which it could only hope for a flabby and ephemeral existence.

We have observed the deleterious effects of allowing factories to spring up anywhere and everywhere they have a mind to, noticeably wherever they can find the cheapest land. They should be confined to districts close and convenient to the lines of railroad and water communication. It will be seen at once that this will reduce to a minimum the heavy cartage and consequent destruction of street paving. This cartage should be guided along main thoroughfares specially constructed to be able to withstand it, affording corresponding relief and saving to the streets in the other portions of the town, where the paving can be of the lightest nature at the least cost. By keeping the factories together in districts by themselves special provision can be made for giving them, in economic and concentrated form, all the facilities for carrying on their work, ample water, sewerage, lighting, heating, and power services, as well as special fire protection. This, too, affords corresponding relief to the other districts where these utilities need only be such as are requisite for domestic requirements. That the sanctity, reserve, and amenity of the home should be held inviolate as a retreat from the turmoil and tumult of the day, seems a truism, and for that reason purely residential sections should be created and kept free of invasion from industrial and business concerns.

Even if there were no other benefits the stabilizing and enhancing effect that this zoning has upon land values is one that cannot be lightly estimated, and might be graphically represented by a gradual upward curve instead of by a series of sharp fluctuations indicating periods of feverish speculation and inflated values followed by subsequent reaction and depression.

Planning Streets to meet Traffic Requirements

To provide efficiently and economically for the flow of traffic, the streets should be proportioned and graduated according to the service they are called upon to perform, with due regard to the future. Main thoroughfares should be direct routes, and for that reason, if for no other, the rigid rectangular layout is wasteful and inadequate in a town aspiring to any greatness. In residential sections all through traffic should be as much as possible discouraged. The streets may be laid out winding with occasional breaks, and the roadway should only be of such width as to accommodate merely local traffic. The building line should be set back to ensure provision for air space, and a sincere endeavour made to emulate a park-like appearance.

The advent of the automobile and the heavy motor truck has revolutionized the problem of street traffic and the paving of streets, creating not only an excessive volume of traffic hitherto undreamt of but exercising new destructive forces to paving. The street parking problem and the question of the ubiquitous garage are also assuming such proportions as to become a real public menace, requiring not only regulation but special provision.

Since it will be found that most of the congestion of traffic in our main thoroughfares occurs at the principal crossings, the corner curbs of these should be well rounded in order to facilitate the digestion of accumulated traffic. For the more important crossings a radius of not less than 25 feet should be established, which is equivalent in its effect to widening a street ten feet throughout. The minimum radius for less important crossings should be fifteen feet, which is the minimum radius in which an automobile can turn and remain normal to the curb. In cases of extreme congestions, circles should be provided to afford the necessary easement.

Parks and Playgrounds

The matter of parks and playgrounds is one of the most essential to conditions of health and well-being; these are the "lungs" of the city. Their ample provision, and convenient and equitable distribution, is of vital moment. They should be acquired well in advance of building development before increasing land values have rendered their acquisition prohibitive. It is not sufficient to have a few isolated patches of ground to be used as parks. There should be a regular park system, linked up with tree-shaded driveways. From a commercial and money making point of view, if for nothing else, this is a splendid investment, for we should not fail to remember that it is the well dressed shop window that catches the customers.

In city planning, as with nearly everything else, a good clean start is half the battle, but if mistakes have been made, as is nearly always the case, the sooner they are rectified the more can be accomplished, and with greater ease and at a much lower cost. If in the already built-up portions of some cities conditions may be considered almost past redemption, which is seldom absolutely the case, that is a very good reason why they should start to work on the outlying portions and do their planning well in advance, laying out their main thoroughfares, parks and recreation grounds, and regulating and controlling all prospective development. Generally speaking it is just beyond the city's boundaries that most of the atrocities are being perpetrated, and there are more slums in the making in the green fields there, than in the heart of the city. For that reason every growing city should annex and control all the land from three to five miles beyond its boundaries while it is yet in the agricultural state, which condition should not be disturbed until absolutely necessary, but the prospective development should be clearly mapped out.

Unsystematic Planning Expensive and Disappointing

A word of warning must be uttered against piecemeal planning, carrying out isolated bits of street widening or extension, a park here and a boulevard somewhere else, according to no well defined scheme or purpose. It is about the best way, to get the least benefit from the most money, one can possibly think of, and unfortunately it is just the kind of planning that appears to have the strongest appeal to the average civic mind. Equally delusive in its inception as it is disappointing in its results, and invariably ending in a hopeless muddle, it is the greatest deterrent to all future sound and well considered planning or effectual improvement. To get real results the whole question must be tackled and studied in a comprehensive way, giving careful heed to all the factors in a city's development, each being indissolubly linked with the other. When a good general plan is prepared there is a clear objective to work up to in a systematic way. It by no means follows that it must be carried out all at once, but only step by step as occasion warrants and means can afford. The well considered ambitious plan is not always the most expensive, but the indifferent one is usually the least economical and the most costly in the long run.

The greatest deterrent to the advancement of town planning is the prevailing idea that it is something frightfully expensive. That depends largely on the kind of planning, whether it is projected on sound, rational, and economic lines, or indulges mostly in fanciful and extravagant embellishment. It also depends to some extent on enabling legislation. Under the principle of excess condemnation, expropriations can be made and wonderful improvements may be, and have been, carried out in such a way as to pay for themselves entirely, giving all the advantages for nothing, and largely increased land values besides.

To do nothing and let things take their blind and wayward course, unguided and untended, is in the long run the costliest way of all and there is nothing left to show for it but a poor inheritance of everlasting trouble, inconvenience, stunted growth and lowered vitality in the community.

There are, however, other things in life which cannot be measured by mere monetary standards; good health, the joy of living, a fine communal spirit, and a just pride in being "citizens of no mean city". These are, after all, about the only things that are really worth while.

Discussion on The Engineer and The Town Plan

H. M. Bigwood, A.M.E.I.C.

Chief Draughtsman, Public Works Department, Victoria, B.C.

In opening the discussion on the paper presented by Mr. Ewing, by reason of more limited experience with the practice of town planning, the following remarks will be confined to elementary but none the less important principles and endeavour to bring forward one or two particular points especially applicable to British Columbia. The foundation for all planning, urban or otherwise, is the subdivision of land, and the conditions under which the subdivision is made will very largely determine the desirability of the town or city, which arises from a public welfare point of view.

The division of land into rectangular blocks as is regularly practised, even on prairie country, is often unsatisfactory and road allowances along a straight line in any direction, through good or bad land, swamps and hills, can hardly be considered the ideal situation for them economically. In our own province, where the terrain is anything but flat, such a system is useless, the topographical conditions are such that every subdivision demands individual consideration.

The primary object of the owner of the land, in subdividing, is to profit himself. He is not founding a philanthropic institution, but is, by making provision for closer occupation, hoping to sell for more than he paid. The people who are to occupy the land, as well as the public generally, will be adversely affected if the conditions resulting from poor planning or lack of consideration for others are detrimental to the welfare of the community. Therefore some restraint must be excercised and by making the subdivider carry out part or all of the improvements such as roads, drainage, water mains and so forth, deterring action may be secured.

The street plan must be laid out so that necessary work may be economically done and heavy construction work eliminated if possible, and in fact so arranged as to location and widths of streets, size of lots, drainage and provision for open spaces, that the community, as it develops, will be able to do so to the benefit of the majority of its members. The problem then is one to be undertaken by men whose training enables them to deal with such work in an efficient manner.

Whenever regulations or restrictions are imposed on subdivisions, such regulations must be justifiable, considered in the light of the public good, and not arbitrary. We have some in various forms already, but in some cases they might be of greater benefit if more definite. Thus, while plans must be approved by a specified official, before registration and the official's powers permit him to demand sufficient information to enable him to decide whether or not the engineering features can be economically carried out, yet a definite obligation for contours to be shown in all original plans of subdivision would help materially. Next, the size of lots and widths of streets must be regulated with regard to the area, business or residential, in which they occur. The building lines along residential streets should also be defined. The subject expands, until we find ourselves confronted with a much larger problem than simply the subdivision of the land, whether in or near a town.

As the paper points out, the need for town planning is not evident in the initial stages. It is only as evil results, arising from small lots, crowded dwellings, bad sanitation, lack of open spaces and congested traffic conditions, become evident that the need for comprehensive planning, or re-planning, is realized.

Is it possible to legislate in such a manner that land now wild or agricultural, when subdivided for profit, will be economically or advantageously laid out with due regard to the best interests of the purchasers and the country, when the site will be the living and working place of a large and busy community? Can we ensure that in every case proper restrictions as to business and residential areas, buildings, streets, open spaces and the other necessarily co-related matters will be imposed judiciously, or must it be always left to chance with the almost certain results described by Mr. Ewing in his paper?

Most cities have some regulations affecting the questions of housing, sanitation and so forth, which are partially effective, but it would seem advisable, particularly when a town is established and its growth assured, to provide for definite planning ahead.

To do this intelligently, the work should be supervised by a body having control of a larger area than the town itself. A town planning commission upon which the town and adjacent municipalities could be represented, but subject to the approval of a government department such as the Department of Public Works through a Town Planning Branch, might be effective. In this way you would control the development of the community and provide for expansion along rational lines in well ordered sequence, economically and with proper regard to the principle of the greatest good for the greatest number.

W. B. Young, A.M.E.I.C.,

Designing Engineer, City Engineer's Department, Vancouver, B. C.

It is unfortunate that Mr. Ewing was unable to be with us to present his paper, but we are indebted to him for his illuminating exposition of a subject in which all professional men and thoughtful citizens are interested.

We are striving after the general betterment of conditions. The present state of unrest in large cities is probably due to the fact that a series of economic conditions are fast coming into conflict with one another and the masses of the people are finding themselves in the zone of fire. Mr. Ewing has outlined to us in a very forceful manner the many difficulties with which we will be confronted if the principles of town planning are neglected. The basic principles of the town planner — call him an idealist if you will — are the betterment of human

existence, and the highest form of public service is surely that which plans to bring rest out of a state of unrest. Just so long as you have the commercial, industrial and residential elements of a city elbowing each other for breathing space, so will that state of unrest exist.

It is sound practical business to town plan. Good residential areas and proper housing conditions will give us healthy citizens. Properly located commercial centres will facilitate the transaction of business, and industrial sites allocated to their logical quarters will simplify questions of transportations and reduce to a minimum the cost of traffic arteries. There is no worthier or nobler object that can attract the sympathetic and practical co-operation of great citizens and enthusiastic men and women than town planning. The ideal — the very best — is the only goal worth striving for.

There is no fairer city the length and breadth of this great land than Vancouver. We are all fully conscious of her business potentialities, her wonderful climate and the unsurpassed beauty of the natural surroundings make us justly proud of being a factor in her development and our love for the port will never blind us to any new ideas that may be brought forward. In town planning we have a forceful factor that will be of great value in the scientific development of our seaport, and if we "get down" to the subject, and have the requisite enthusiasm we have the materials to work upon which will, ere long, make Vancouver a city second to none in the Empire. In about thirty-six years we have risen from a sleeping village on the foreshore of Burrard Inlet to a city of nearly two hundred thousand souls. A city admired by all visitors from other lands and a place of great attraction to tourists the world over. That is a record to be proud of. Mistakes have been made, we all admit that, but the rapid growth of the city is responsible for nearly all of our shortcomings.

It is rather a pity that Mr. Ewing is so far away, otherwise he would probably have given us a lead and some suggestions as to the application of town planning principles to Vancouver and district. For the sake of discussion the following ideas are submitted.

> The time is now ripe to plan ahead in order to counteract the evil effects that will arise, if the points mentioned in Mr. Ewing's paper are not given serious consideration.
>
> In a very short time Vancouver, as we know it to-day, will surely be the hub of a greater city whose boundaries will have extended south, east and west. With that fact in mind, a comprehensive survey should be made of the whole peninsula of Greater Vancouver and a skeleton development plan prepared showing the main and secondary lines of traffic arteries.
>
> Zone areas should be mapped out for the following classes of property:—(1) Residential property; first, second and third class according to the number of houses per acre decided upon; (2) Commercial and shopping centres; (3) Industrial areas; (4) Unrestricted areas. Such a scheme would, of course, require the whole-hearted and unselfish co-operation of all the adjoining municipalities. This can only be accomplished by earnest and untiring effort on the part of responsible leaders, but it can be done.
>
> A good town planning exhibition and a series of attractive illustrated lectures on some special phase of town planning would go a long way to interest the general public in the principles of city planning.

Just for a moment let us consider the advantages of a comprehensive zoning scheme for Greater Vancouver, by reviewing certain difficulties with which we are confronted in this city, due to the fact that no town planning scheme existed. These difficulties are the result of general changing conditions and cannot be placed at the feet of any particular party.

Somewhere in the neighbourhood of one hundred and sixty-four acres of land at the head of False creek have been reclaimed and the district will become a hive of industry in the future. Out of this area, which is reserved for railway terminal and general industrial purposes, will flow a great volume of traffic. This area is practically a cul-de-sac, surrounded as it is on three sides by high lands which almost prohibit traffic egress. In consequence of this condition most of the traffic will find its way on to Main street, an artery already severely taxed, with the accompanying confusion that may possibly occur. The city engineer has wisely defined a new building line on Main street in the vicinity of this area which will ease conditions in the future, but the situation there is so acute that the question of transportation facilities, for the whole district in the immediate vicinity of the railway terminus, should be reviewed along town planning lines. Under a town planning development scheme the future requirements arising out of a reclamation scheme of this nature would have been fully developed before any negotiations were completed. In all probability the Georgia-Harris viaduct would have found its logical landing on the east side at Prior street to take care of the increased traffic from this new railway centre.

Scattered over the city, industrial establishments are opening up and as time passes the demands for transportation facilities are steadily increasing. These scattered communities are going to mean expensive pavements in the future and great maintenance cost. Under a town planning scheme these areas would be scientifically located and a minimum cost required to feed them with road transportation facilities.

We have also a curious condition to face in the Kitsilano district where the old Indian reserve, of roughly eighty acres, is ear-marked for industrial sites. One wonders what the effect will be on the really good residential property around the fringe of this proposed industrial site.

No doubt our present tax rates would have been considerably reduced if this city had expanded along town planning lines. By the institution of what we might term "development zones", a controlled system of expansion could have been followed along economical lines. These development zones might have been divided into three great heads: (1) An inner circle zone within which full public services would be available, such as reasonably good roads, water-supply, sewerage facilities, light, power etc.; (2) an intermediate zone provided with limited public services; (3) an outer zone which we might refer to as "a pioneer zone".

Such an arrangement would relieve the authorities of the necessity of providing roads and other services in undeveloped areas and would also relieve them of the heavy costs involved in providing facilities that one would only expect in a well established area. A settler would thus know exactly what to expect in the zone in which he decided to locate. The general expansion would thus be from within, and as the city increased in wealth and property, improvements to the outlying areas would develop as a matter of course. A scheme of town planning covering the whole of Greater Vancouver might with advantage include "development zones" along the lines suggested.

The segregation of the oriental population of this sea port is a matter that should receive very careful and immediate consideration and is of vital importance to the formation of that community spirit so essential to the welfare of Vancouver. The importance of public health in only realized by the general masses when an epidemic of disease springs up in our midst. The necessity for town planning will probably only be fully realized when we are faced with expensive reconstructive problems due to the neglect of town planning principles. There is probably no city where municipal engineering problems are being more efficiently handled than in Vancouver. The immediate necessities are well under control, but a greater responsibility rests with all our technical and professional men and healthy citizens. Town planning means looking ahead and our responsibilities run in that direction.

It is a privilege to have had the opportunity of hearing Mr. Ewing's paper. The subject is one in which we are all interested and in the study of which we find much that is wholesome and refreshing.

Irrigation in British Columbia.

A Review of Irrigation in the Province from the Earliest Undertaking to the Present Extensive Systems.

Ernest A. Cleveland, M.E.I.C.

Consulting Engineer, Department of Lands, Victoria, B.C.

Paper read before the British Columbia Professional Meeting of the Engineering Institute of Canada, Vancouver, B. C., July 16th, 1922

Compared with some of the older provinces of Canada and with the great western prairie provinces, British Columbia may not be regarded as a province of prime agricultural importance. The generally accepted estimate of 22,600,000 acres as the agricultural area of the province in comparison with 81,300,000 acres of agricultural land in Alberta, for instance, may lend support to such a conclusion. Of this area 3,000,000 acres are occupied and approximately 700,000 acres are under cultivation, in 16,000 holdings of from five acres upwards. The disparity, however, between the available arable acreages in this province and the vast areas of our neighbours to the east and in the adjacent states to the south, is to some extent at least offset by the excellence of the climatic conditions and soil characteristics of some of our valleys, which make them peculiarly adapted to crops of high value and admit of an intensive cultivation and a density of agricultural population not possible in many of the farming districts elsewhere. The relatively limited area of these valleys nevertheless emphasizes the desirability and the necessity of making the very best use of them.

It is not surprising that in the area in which our agricultural lands are found, extending from the 49th parallel to say the 56th — the latitude of Hudson's Hope — and extending westerly from the 114th meridian to say the 130th, covering a range of altitudes from sea level to perhaps 3,500 feet, there should be wide variations in both summer and winter temperatures and in the more important factors of sunlight and precipitation.

Where Irrigation is Required

In localities so arid as to suggest a much more southerly latitude, land has no agricultural value other than that of range land, unless supplied with water for irrigation. The amount of annual precipitation does not alone determine the localities in which irrigation is necessary, for the precipitation during the growing season, humidity, proximity to the sea coast, elevation, soil conditions and kind of crops are important factors. It may be said in general that in those portions of the province where the annual precipitation is less than from sixteen to twenty inches irrigation is always desirable and generally necessary. The following table, showing the mean annual precipitation and the mean during the four months when vegetable growth demands the greatest amount of moisture, indicates that at widely separated points the natural conditions require to be supplemented by irrigation.

PLACE	Average Rainfall during four Summer Months	Average Yearly Rainfall
Victoria	2.86	27.66
Vancouver	8.76	59.06
Agassiz, (Lower Fraser)	13.56	63.78
Quesnel, (Upper Fraser)	6.25	14.78
Kamloops, (Thompson valley)	4.58	10.25
Summerland, (Okanagan valley)	4.53	11.04
Grand Forks, (Kettle valley)	5.95	16.25
Nelson, (Kootenay valley)	8.46	27.03
Invermere, (Columbia valley)	5.85	12.14

The best estimate available of the area now under irrigation in the province is 69,882 acres. This is, at best, an approximation, as the areas under individual operations are widely scattered and the data in respect of them are far from complete.

Legislation Governing use of Water for Irrigation Purposes.

The records of the Lands Department show that the first water right granted for agricultural purposes was under date of October 30th 1858, for the use of water from Nohomeen creek near Lytton. This was in the Crown Colony days and antedated by nearly a year the provisions of the proclamation by Governor Douglas, known as the Goldfields Act 1859, and the rules and regulations thereunder in which the first specific reference to the acquirement of water rights is made. The Act, it may be noted, applied particularly to the use of water in mining. It first enunciated the principle, since maintained throughout all our water legislation, known as the doctrine of beneficial use. From 1860 to 1864 a number of further records were made for agricultural purposes under this Act.

It was not until the enactment of the Land Ordnance in 1865 that distinct provision was made for the diversion and use of waters for agricultural purposes. The subsequent amendments and consolidations of the laws affecting Crown lands carried the water legislation down to the passage of the Water Privileges Act of 1892, which declared the right to the use of all water not at that time recorded and appropriated, except that under the jurisdiction of the Parliament of Canada, to be vested in the Crown in the right of the Province. This Act was followed by the Water Clauses Consolidation Act 1897, and its various amendments designed to meet the needs of the country's development. Owing to certain elements of weakness in the legislation and in view of the great number of records that had been made in the fifty preceding years, many of them imperfect, the Legislature of 1909 created a Board of Investigation with authority to review and define all existing rights and order the issue of licences in respect of them. The Board is a semi-judicial body, exercising wide discretion in the matter of old rights and is charged with many other duties under the Act of 1909 and the Water Act 1914 which, with its amendments, is the code now in force.

It was not until 1908 that particular reference was made in our legislation to the storage of water, although a number of the early records undoubtedly carried storage privileges. In the 1909 Act recognition was first given to the need of a wider use of water for irrigation purposes than that which could be provided by the individual settler and licensees were empowered to combine for the construction of works. In 1913 provision was made for voluntary partnerships, to be known as Water Users Communities, for the purpose of constructing and operating works. More elaborate provisions were made in the Water Act 1914 for other methods of co-operative or corporate enterprises by way of the Mutual Water Company, the Land and Water Company, and Public Irrigation Corporations. Some of the changes, which experience has shown to be desirable in respect of these joint or corporate undertakings, will be referred to later. The 1914 Act also provided for the appointment of district engineers, to whom were assigned certain administrative duties, giving an element of local control in the diversion and use of waters and in the establishment of rotation on streams where the flow is inadequate for the continuous supply of all the licences thereunder.

To the consistent care that has for years been bestowed on Provincial legislation in respect of water may be attributed our comparative freedom from legislation in connection with its use and administration.

In the adjudication of the old irrigation records the Board of Investigation set a general duty of water at two and one-half acre-feet per acre, with reasonable allowance for losses by seepage from point of diversion to place of use. The latter is estimated for each particular case by the engineers of the various water districts in accordance with the data available for the creeks, ditches, flumes and other means of carriage. In certain localities duties as high as one acre-foot per acre and in others as low as three acre-feet per acre are allowed, depending upon the climatic conditions of the place and the nature of the soil and subsoil and upon the character of the crops grown, though the latter are subject to considerable change. Speaking broadly the duty as set had the merit of being generally adequate. The application of twenty-four to thirty inches in depth of water to cultivated ground during an irrigation season varying from ninety to one hundred and twenty days, distributed with care, is found sufficient for the ample production of tree-fruit, root or forage crops, except from the most porous soil or in localities where hot winds prevail during the growing season. It is hoped that studies may soon be undertaken in some of the irrigation districts where facilities for careful measurement of water are being provided, with a view of determining more closely for particular localities, soils and crops and with a fair degree in application, what results may be expected with certain quantities of water.

To those not directly concerned with irrigation the statement that it has been shown experimentally that from 400 pounds to 800 pounds of water is required to mature one pound of the dry vegetable product from certain soils and several times that amount of water for other soils: or that 2½ acre-feet of water per acre means the application of 550 tons of water to each acre during the irrigation season: or that it has been estimated that a forest may transpire more than 2,000 cubic feet, i.e. more than 60 tons of water per acre each day of the vegetative season, will indicate at once the great quantities employed and the importance of having, for our own province, some experimental studies under varying conditions. Increased duty of water resulting from avoidance of waste means generally a greater area that may be supplied from the same source or smaller works for the same area and greater freedom from damage to lower lands due to seepage. The latter problem has already begun to make itself felt in some of our older districts.

Irrigation Difficulties in British Columbia

It is stating a truism to say that the proper use of water for the production of crops requires the application of intelligence and skill. It is equally obvious to one who may visit the various irrigated districts in British Columbia that perhaps in few places where the art is practised has nature offered more challenges to man's ingenuity to secure sufficient water for a season's use, store, carry and distribute it, at a cost within commercial limits.

A consideration of the topographical features of the interior of the province reveals the reasons. Our valleys are very narrow and are occupied generally by rivers which meander from side to side and to expansion into lakes that occupy the valley floors where broad stretches of moderately level lands might be expected. Our irrigable lands are so disposed that it has not been possible to make direct diversion from the lakes for any considerable area of land along the rivers below them. The arable lands about the lakes depend, therefore, for water upon the lateral streams or upon pumping. The latter in general is often restricted by the elevation of the lands and frequently by the absence of cheap power. Owing to the great range in river stages in the interior, the larger areas of lower lands along them are in greater need of drainage than of irrigation, while the bench lands that border the rivers are in most cases too high to permit of direct diversion from them. As a consequence these lands also depend for irrigation upon the waters of lateral streams. The only instances of gravity diversion from the larger rivers so far for any appreciable area is for the Southern Okanagan project, and for the Similkameen Fruitlands. The East Kootenay valley, extending from Canal Flats northward along the Columbia to Golden and southward along the Kootenay to the International boundary, the valley of the Fraser from Quesnel south, and of the South Thompson, afford striking confirmation of some of the above statements.

The rapid run-off of the lateral streams demands that storage shall be provided to supplement the period of low flow. Here again nature has been adverse in that she has allowed of few opportunities of storage between the summit country, in which the streams have their sources, and the valley levels. Small lakes and basin-like depressions and meadows are to be found at or near the heads of many of the streams but their value as storage reservoirs is more frequently limited by the relatively small catchment areas above them, than by the unsuitable nature of the sites at which they may de dammed. The spring run-off from the lateral streams in the Dry Belt would provide water for the irrigation of many times our present area were it possible to find suitable and adequate storage.

The extremely rugged topography of much of the country bordering the streams and the generally broken and rolling nature of the irrigable lands have furnished the physical difficulties to be overcome and have added greatly to the cost.

Nevertheless the pioneers and promoters of the earlier irrigation enterprises went boldly forward with an forming considerable parts of the works or the costs of optimism and energy worthy of so good a cause, but apparently without a due appreciation of many of the factors in the problem, such as: a proper knowledge of the available water-supply from the streams; the wide seasonal variations in stream-flow, and the amount of storage necessary; the increasing requirement of water for maturing orchards and the losses in conveyance, and distribution in earth ditches and wooden flumes; the relatively short life of many of the temporary structures maintenance and operation. The works were generally constructed of wood and were of a temporary nature; and the low costs of labour and materials allowed of the works being constructed as cheaply as possible. All things considered the materials and types of construction generally were the most appropriate for the time and stage of development. The failure of many of the enterprises was not attributable alone to the factors mentioned but in some measure to other contributing causes. Had the enterprising pioneers of corporate irrigation undertakings in this province foreseen all the conditions there would have been fewer failures, but irrigation agriculture in British Columbia would to-day be far behind its present development.

Early Operations of Land and Water Companies

The first instance in the province of sales of small tracts of irrigated orchard lands was in 1893 under the system from Coldstream creek near Vernon, on which there was a water record granted as early as 1868. This was due to the enterprise of the Earl of Aberdeen, and established the value of irrigation in that district which has since become one of the most beautiful and productive areas in the province. Following the Coldstream venture, which preceded by several years any similar effort, large tracts of land throughout the Dry Belt were acquired and companies formed for the purpose of developing and selling small holdings.

There were several variations in the methods in general use under which companies conducted their operations. An ordinary way was for the "land company" to acquire water rights which were made appurtenant to the lands and under the law became inseparable from them in that they passed automatically with any transfer, sale or other disposition of the lands. The company became what was commonly known as a "Land and Water Company" and sold its lands subject to an agreement under which it undertook, in consideration of an annual rate per acre payable by the purchaser, to supply, convey and distribute the water. The logical sequence of this form of conduct was that when the company sold all its lands, its particular interest in the project would cease and the purchasers would then require to make such arrangements as would be necessary for continuing the operation of the system. It so happened that the companies were unable to sell all the lands and in those instances where the companies did not either directly or indirectly cultivate considerable areas they were themselves later emmeshed in the general distress that surrounded the purchasers.

In order to correct one of the obvious defects of this plan and to ensure to the purchaser an actual interest in the works and a consequent responsibility toward their

upkeep, land companies in one or more instances created subsidiary water companies whose business it was to construct the irrigation system and carry and distribute the water. The share capital of the water company was made equal to the number of acres it was proposed to irrigate and as the lands were sold an equity in the system, by way of shares proportionate to the number of acres sold, was transferred to the purchasers.

More commonly the land company created its subsidiary water company without any relation between the share capital or number of shares and the acreage held by the parent company, with no provision for the transfer of water shares with the land as in the case just referred to. The water company constructed and operated the works and the lands were sold subject to an agreement with it for the supply of water at a rate per acre or per acre-foot. Money for construction was generally provided by the sale of bonds. The land company's chief interest naturally lay in seeing its lands sold at satisfactory prices. The water company was left to maintain and operate its works and supplying the user with water.

The unsold lands of the parent companies, except in special instances where cultivated, paid no rates to the water companies, consequently the income was derived solely from the water user and was insufficient for their actual needs, maintenance was sadly neglected, many of the systems gradually fell into disrepair; no sinking funds were set aside for future restorations and reconstruction; and in some of the more important instances the bond holders were obliged to apply to the Courts for the appointment of Receivers who operated the systems as best they could.

The rate per acre payable under the several water agreements varied considerably. With the exception of the first agreements made by Lord Aberdeen with his users under which the rate was thirty cents per irrigable acre per year, the general range was from $1.50 to $5.00. In one case an annual rate of $4.00 per acre per year, toward the general maintenance of the works, was made, together with a charge for the conveyance of the water not to exceed $8.00 per acre-foot. A general acceptance of such charges might have hampered development but would have represented a much nearer approximation to the actual costs.

The quantities of water which the companies undertook to deliver varied. In one instance it was the proportion of water from time to time passing through the main ditch that the irrigable area of the user bore to the irrigable area under the system. Again it was the water available to the company divided in the ratio of the area of the user's lot to the total area of the lands to which the record was appurtenant but not to exceed in any period of three and one-half days a greater quantity than one quarter of an acre-foot per acre.

It is interesting to note that, prior to the year 1906, four land companies were incorporated for the purpose of dealing in irrigated lands. Up to this period no separate water companies had been formed. In the succeeding years, to and including 1912, fifty-six land companies and eighteen water companies were incorporated. Of these there are to-day remaining in an active state ten of the former and two of the latter. Of the ten operating land companies three or four appear to be functioning with greater or less degree of anxiety and the remainder are existing with great difficulty. Systems constructed by two of the companies, *viz.* Southern Okanagan Land Company and Summerland Development Company, were purchased and are operated by the municipalities of Penticton and Summerland, respectively.

Provincial Legislation to Provide Assistance

As already intimated a period of distress was bound to arrive. Appeals for assistance were made to the provincial government. Legislation in 1917 provided drastic methods of dealing with cases where a company failed to carry out necessary works, under the provisions of which authority was given for an order by the Lieutenant-Governor in Council declaring the appurtenancy of the works to the lands they were intended to serve. This authority has been invoked only in two instances.

A more beneficent piece of legislation was that of 1918 which made provision for the creation of a Conservation Fund to be administered by the Lieutenant-Governor in Council on the recommendation of the Minister of Lands from which necessary financial assistance might be given in approved cases, either by direct expenditure or by way of loan. The expenditures to date have been approximately one and three quarter million dollars. The duties of investigation, report, and supervision have fallen upon the Water Rights Branch of the Department of Lands.

Immediate aid was given in several cases to keep the systems in a condition to carry water and in 1919 extensive studies were undertaken to increase our knowledge of the water resources of the summit country on either side of the Okanagan valley. It was in this valley that help was most urgently required. A classification of the lands under or adjacent to the various systems was made so that a determination could be arrived at of the areas that might be supplied both now and in the future from the sources under consideration. Examinations were also made of the general condition of the works.

Results of Investigation upon which Government's Policy was based.

A careful study of the economic aspects of the situation revealed a maze of physical, financial and legal difficulties that led to certain conclusions on which the government's policy was based.

Firstly: The works must be acquired by the land owners and water users under them and their complete separation from companies, bond holders and shareholders effected.

Secondly: The money required for the purchase, restoration and extensions of the works must be obtained through governmental agency.

Either the guarantee of bonds by the government or direct loans from the Conservation Fund were indicated. Bonds without guarantee would be unsaleable. Guaranteed bonds would place the liability on the province, but would not be expected to sell at as high a price as provincial debentures. The burden of the users would in general be heavy for it was manifest that they had in many cases purchased their lands at prices which might reasonably be held to include a pro rata share of the system, in which they had, however, no legal interest. They were now faced with the problem of borrowing money to purchase the depreciated works and to provide for renewals.

Costs of construction due to abnormal prices of labour and material would be heavy so that it appeared necessary to lighten the financial load as mush as possible. The most effective way of reducing the interest burden appeared to be by making the Conservation Fund a slowly revolving fund and handling the problem by loans therefrom. Raised on the general credit of the province and loaned at a rate that approximates the cost of money to the province it afforded the method selected.

Thirdly: Legislation of as simple and practical a nature as possible must be provided under which appropriate areas could be formed into irrigation districts. The districts to be formed to include all the lands which the constructed systems and necessary extensions of them could carry where a sufficient water supply was or could be made available.

Fourthly: In order to more equitably distribute the burden and to promote production every acre of irrigable and arable land included in a district, whether using water or not, would be required to pay a proportion of the capital charges in respect of it.

Fifthly: Repayment of moneys borrowed would be made in annual instalments with interest and would be computed on a consideration of the probable lives of the various structures in which it would be expended so that by the end of the useful life of a structure all sums borrowed in respect of it would have been paid.

The districts where the necessity of assistance was greatest were the first to receive it. All matters affecting the various questions at issue were discussed with committees of water users and the negotiations for the purchase and transfer of the numerous rights and interests in the systems were undertaken. Concurrently repairs and renewals were vigourously carried on. Additional storage was created and extensions to the works put in land. Legislation was prepared and passed at the session of 1920.

Irrigation Districts Established

At the end of the year six irrigation districts were incorporated by Letters Patent and the systems transferred to them. Since that date others have been formed and consideration is being given to the petitions for several more. The Letters Patent may be considered as the constitution of the district since they define its particular powers and obligations and set out the special provisions applicable to it.

It will be observed that the districts are borrowing concerns and that they have complete ownership of the works that serve them, subject to the first charge by the Crown in respect of all moneys expended on them from the Conservation Fund. Control of the district affairs is placed in the hands of the trustees elected by the users at large for periods of one, two and three years. The lands are graded by an assessor and the roll revised by a Court of Revision. Taxes for the primary purpose of making repayments to the Conservation Fund are levied pursuant to by-laws and tolls for the use of water and for administration purposes are set in accordance with the needs shown by the district's budget. Taxes if unpaid become in arrears at the end of the first year, are delinquent at the end of the second year after which the property may be offered at tax sale. With one or two district exceptions water is not supplied if tolls for the preceding year remain unpaid. A uniform system of accounts is used so that expenditures on certain classes of works and other items are comparable. The users have the opportunity of expressing themselves fully at an annual meeting at which a financial statement is presented and the trustees give an account of their stewardship.

Taxes differ considerably in the several districts and vary according to the capital costs per acre and the grade of land, from $2.45 to $15.00 per acre for first grade lands. Tolls are based on different conceptions of the trustees as to how water should be charged for in order to meet maintenance and administrative charges and according to the circumstances attending the supply and use in the particular district. A minimum toll entitling the user to one acre-foot with an additional charge or charges for all water in excess or a charge per acre-foot for water used before a certain time, i.e. before storage water is required and a higher unit rate for later water is not uncommon. Tolls in the different districts vary from $1.00 to $6.75 per acre per year.

The fact must not be lost sight of that the greatly increased annual per-acre cost of water to the user has been brought about by the adversities already referred to that have attended the growth of the industry.

The necessity of borrowing to meet the large expenditures for the purchase and rehabilitation by the users of systems that did duty from the time of their installation with little maintenance and no provision for renewal, imposes an interest charge that must be carried. The inherent high costs of irrigation construction in a rugged country and in times of abnormal costs has also added its quota. The districts now operating are given in the following table.

Irrigation District	Location	Irrigable Area in Acres
Vernon	26,000 acres surrounding the city of Vernon	14,130*
Glenmore	North-east of Kelowna	2,565
Black Mountain	East of Kelowna (a block of 11,028 acres)	4,607
South East Kelowna	South-east of Kelowna	5,433
Scotty Creek	North-east of Kelowna	1,000
Peachland	At Peachland on west side of Okanagan lake	700
Naramata	About the village of Naramata; near end of Okanagan lake	1,050
Westbank	Slightly south of Kelowna; west side of Okanagan lake	1,200
Kaleden	At Kaleden in Okanagan district.	
Grand Forks	Adjoining town of Grand Forks	4,150

*Estimated

In the above table are listed the names of the irrigation districts now in operation which were described in detail by the author.

Among the smaller districts incorporated within the last two years are Malcolm Horie District near Cranbrook, Canyon Creek and Erickson near Creston, and Heffley Creek and Vinsulla on the North Thompson river, tributary to Kamloops.

The number of incorporations to date under the several forms of control are:

Irrigation Districts under the Water Act	11
Irrigation Districts under the Drainage, Dyking and Development Act	3
Water Users Communities	8

In view of the experience under the 1920 amendments to the Water Act pertaining to districts it seems probable that with the exception of the smaller communities the organizations will gradually be changed to bring them under its provisions.

Among the companies still operating are the:

Okanagan Valley Land Company, supplying 2,000 acres at Okanagan Centre and with an additional 1000 or more acres yet to develop. Its water supply is taken from Vernon creek.

Woods Lake Water Company on the lake formerly known by that name. An area of 800 acres is well developed, the company having been formed in 1907.

Long Lake irrigation Company with an area of 800 acres lying on the west side of Long lake at Oyama.

The Keremeos Land Company occupies the Similkameen valley immediately south of Keremeos; 1,050 acres under the system being in cultivation while the water supply from Ashnola creek is adequate for 1,000 acres of additional lands.

Similkameen Fruit Lands Company, operates just below the Keremeos Land Company drawing its supply from the Similkameen river at Cawston. It has several hundred acres under its ditches and proposes to pump for an increased area.

B.C. Fruitlands Company at Kamloops, was among the early companies. It has been irrigating a considerable acreage of its own lands, much of which it has under lease.

Columbia Valley Irrigated Fruitlands. Extensive systems were constructed in 1910 to 1912 for the irrigation of 14,000 acres of land in the Invermere section of East Kootenay District but development has been slow.

Municipally owned and controlled systems are those of Penticton and Summerland already referred to. The areas under each are well developed and important producers.

The only project undertaken directly by the Government is that in Southern Okanagan extending along Okanagan river from a point about two miles below Vaseau lake to the International boundary. The water is taken directly from Okanagan river by means of a concrete diversion dam and is carried in a concrete lined canal for about seven miles and conveyed by a seventy-eight-inch wood stave and an eighty-inch steel inverted syphon to the west side of the valley and from thence to the southerly end of the project. When completed the main canal will be twenty-one miles in length. Pumping is resorted to for areas above the canal. Approximately 12,000 acres will be irrigated of which approximately 1,300 acres are being irrigated this year.

No reference has been made to the numerous individual and small community irrigation works throughout the interior. In the aggregate they are of great importance and have added their quota to our annual crop production and their valuable experience to the general fund.

Tribute must be paid to the excellent work done by many of the early engineers who pioneered construction of irrigation works in this province, among them the late Chas. A. Stoess; A. E. Ashcroft of Vernon; F. W. Groves of Kelowna; and F. H. Latimer of Penticton.

It is not proposed to discuss in a general paper such as this the engineering features of the works referred to. They are of the types of design and construction generally used for their respective purposes and represent few unique features. Open ditches and wooden flumes are, of course, widely used, though much concrete lining varying in thickness from two to four inches and some gunite lining, has been done of late. Metal flumes have been, and are being, extensively used. It is too early to give even a general statement of their length of life under the varying condition of use. Some of them have been in place for eleven years and are still in good condition. They have not had very fair treatment for in most cases no care by way of applications of tar, asphaltum or other preservative has been given them. On the other hand there are many instances of wooden flumes having given ten to fifteen years' service and still carrying water, though becoming generally decrepit. The maintenance charges must have been heavy but it cannot be denied that wood flumes still have a place in irrigation works in a new country.

The semi-circular wood-stave flume has not had the use its merits would appear to justify. The use of pressure creosoted lumber should make it a fair competitor of the metal for localities where transportation costs are light and leakage in the spring not important, though the greatly decreased costs of metal of late may offset the advantages. The newer zinc flumes have, so far as the writer knows, not yet been used in the province.

During the interval since the first projects began operations, much has been gained; the land has shown what it will do; the adaptability of various localities to the growth of particular crops — fruit, roots, cereals or forage — has been demonstrated, the varieties of fruits most suitable to each locality and the merits and demerits of intercrops or two-storied farming have been pretty well determined; the means and methods of combatting the insistent pests have been improved; the necessity of fertilizing by the keeping of live stock, the rotation of crops such as alfalfa and root crops or the use of commercial fertilizers has become apparent. Experience has shown where the relatively few frosts pockets are located in the areas under the ditches. Costs of production have been studied and the advantages and defects of co-operative and other forms of handling and marketing the crops have been experienced and debated. Much light has been thrown upon the suitability of the various classes of works to meet unusual local conditions and the probable useful life of the structures involved; while much valuable information of many related matters has been acquired.

Most valuable of all is the experience and skill of the large number of farmers and orchardists on these irrigated lands who have gained their knowledge of the complexities of this branch of husbandry through the hard knocks of personal experience — an experience that forms a most substantial foundation for progressive development of irrigation in the province.

If in the future some of the errors may be avoided that have in the past made the way difficult and some additional attention be given to those breaking ground in new projects, there appears to be no doubt but that the industry will afford the most ample justification for the confidence of those who pioneered it and for the pledge of public credit that has come to its rescue.

Discussion on Irrigation in British Columbia

P. J. Jennings, M.E.I.C.,

Acting Assistant Commissioner of Irrigation for Alberta and Saskatchewan.

The speaker has dealth with; (1) the history of irrigation in British Columbia from the date of the first grant, (2) the result of a want of foresight in the early administration of, or, rather the lack of any legislation dealing with water administration, (3) the errors and complications which resulted therefrom and the methods and subsequent legislation necessitated to correct same.

A word of praise is undoubtedly due to those who have been responsible during the past ten years for the administration of the Water Rights Branch and for the success they have undoubtedly achieved in straightening out many very complicated tangles of a semi-legal, semi-engineering character. As a result of their efforts the Province of British Columbia has now been placed on a sound and business like footing as regards its water rights.

Fortunately, for the future of our water resources, we in Alberta and Saskatchewan, are more fortunate in regard to the laws governing its diversion and use. With great foresight and possibly influenced by the unfortunate experiences of the western states, the framers of the Federal Irrigation Act, provided that a limit should be placed upon the quantity of water that might be appropriated for use per irrigable acre. This quantity was at first fixed at two acre-feet for each irrigation season, to be measured at the point of delivery of any farm unit, and was at the time considered sufficient for the average crop, and requirements in these arid sections. This quantity was therefore established as the "legal duty of water." After a few years of experience it became apparent that this was an excessive quantity to apply to most crops and the department after making a careful study of conditions and carrying out experiments in several sections of the province increased the duty to one and a half acre-feet per acre. That is to say the duty or work that a unit quantity of water is required to do was increased.

Where such extreme conditions as to area and available water supply, as we have east of the Rockies, exist, i.e., only about ten percent or five million acres of the area that should be irrigated, can be irrigated, you will realize very readily the enormous value of any experimental work which would tend to a more economical use of water. Our investigations have proven that under similar conditions this "duty" or volume of water that is required to mature a crop on an acre of land, remains fairly constant for the same crop, but varies widely for different crops, soils and climates. If then this valuable information, the result of years of study and experiment, could be given to every irrigator in a form that he could understand, a great saving of water would result, but he must first realize that he will receive an increased production from a scientific rather than a haphazard use of water.

We have collected a lot of data regarding the results of nine years of experiment station work at our Brooks farm and this has been written up in language that can be readily understood by the farmer and will be published at an early date. It has been generously illustrated and every conceivable implement required for irrigation farming on the prairie has been depicted and explained.

Professional Engineering in the British Columbia Logging Industry

Primitive Logging and the Development of Modern Scientific Methods.

T. W. Fairhurst, A.M.E.I.C.

Sales Engineer, Vancouver Machinery Depot, Limited.

Paper read before the British Columbia Professional Meeting of The Engineering Institute of Canada Vancouver, B.C., June 16th, 1922.

The remarkable advances made in recent years in the magnitude of logging operations in British Columbia have been coincident with the increasing use of professional engineering services in the woods, and the further scientific development of this primary natural industry of the Province is now dependent entirely upon the services of professional engineers, both civil and mechanical, as well as the newly developed forestry engineer who is intended to be a judiciously specialized combination of both.

Historical References to Primitive Hand Logging

Thirty years ago, in the very early days of logging, the operation was extremely primitive. Only timber actually on tide water was selected for cutting, owing to the ease with which it could be dropped into salt-water for towage to mills. This simple programme was carried out mainly by hand logging, the only appliances necessary being the hand cutting tools and a selection of jacks which, attached to stumps or trees, were used to shift the logs about.

Skid roads were laid to tide water without any attempt at economical location, other than picking out an easy path with the eye, and down these skid roads the logs were slid with the aid, in some cases, of horse or bull teams. This method of production was very slow and limited, but comparatively cheap.

Some few years later enterprising operators, who were by this time getting quite a few hundred feet in-shore from tide water, began the use of primitive mechanical aids, such as the single drum horizontal steam spools, supplied with steam from small low pressure wood fired boilers; the haulback, or return line, being hauled out for a new load by a horse. This was a slight improvement over purely hand logging and was quickly followed by improved machinery which in a very few years had developed as far as the simple yarding engine with main-line and haulback drums, and supplied by a properly designed boiler, all mounted on braced timber skids, and capable of being moved by its own power to fresh locations as required. Logs yarded to a central point by this means were sent down to tide water by means of simple roading engines handling the long haul to the sea by pulling or lowering trains of logs down the previously described roughly located skid roads.

Advent of the Railroad as an Aid to Log-transportation

Following closely on this phase came the railroad. Sea-shore limits became rapidly exhausted; the logger was now boring inland and was beginning to measure his haul to tide water in miles instead of feet. Here begins the advent of the civil engineer into the logging industry. Having yarded the logs to a central point the operator was faced with haulage to the sea. The old eye-sight method of road location was no longer feasible and the engineer proper was called in and the railroad was located and built. In the early days this was of very light construction, probably not more than thirty-pound rails being used, and, in order to accommodate the capacity of the ten- to twenty-ton straight connected locomotives then in use, no grade over three percent could be allowed.

On the heels of the last phase came the geared locomotive, capable of handling grades up to eight percent, and thus shorter cuts to any given point were made possible and logging locations hitherto inaccessable were rendered accessable.

The advent of railroad operation resulted in yet another new departure, the steam loading donkey. Throughout the days of skidding operations no special bodily lifting of the logs had been necessary, but to load the centrally yarded logs on cars necessitated the adoption of other means. Accordingly the crotch line loading system was introduced, consisting of a single line working through a tree-mounted block, but forked out to hooked points so as to grab each end of the log; the single line being worked by attachment to a loading drum on the yarding engine or by a separate simple loading engine.

Intensive Mechanical Development

Here begins a long period of intensive development of the mechanical aids to log-getting; a fierce period of technical competition during which the ingenuity and resource of the mechanical engineering designer has been taxed to the utmost, until to-day no location is impossible of operation.

First in this period came the two-speed yarder with high speed on low power for straight unobstructed hills and, per contra, lower speed with higher power for worrying the logs out of obstacles. This class of engine resulted in the getting of more logs per day than the simple loading engine could handle. Accordingly the duplex loading engine was brought in; this machine having two sets of engines, instead of one, handled the log with one engine acting on each end, each engine having its own line, each log therefore being loaded just twice as quickly as by the simple engine, which latter had to have its logs swung and adjusted by hand.

Then came the aerial skidders with enormously powerful engines by which the logs were brought in on air lines instead of being yarded along the ground by the old method, which often resulted in serious damage to logs through bucking ground obstacles. Larger duplex loading engines were required and brought into use, with the result that, instead of the old fashioned donkey of twenty-five years ago reaching out for about 1,000 feet and getting in perhaps 30,000 feet a day, we have the complicated monster of to-day reaching out to 4,000 feet, by aerial lines, and getting anything up to 200,000 feet a day.

Even the braking on these modern engines has now got beyond the powers of the hand-brake, the steam friction and dogs, and air brakes of the locomotive type are now found on the most modern engines.

The aforementioned period of strenuous mechanical competition has also brought in modern air-brake lowering engines, the compounding and duplicating of steam cylinders, and boiler pressures up to 200 pounds, with the result that some of the modern steam logging plants weigh upwards to one hundred tons and arem ounted on all-steel railroad cars for transport, as against the old time ten-ton donkey on its primitive wooden sled.

Development of Heavy Geared Locomotives

Locomotive work has also developed out of all recognition as compared with old time methods. In British Columbia alone there are a score of operators owning railroads. Weights of locomotives have increased until, to-day, geared logging locomotives, in many cases, weigh up to ninety tons and are capable of handling loads on grades to eight percent with as much ease as in the case of the same loads handled on level road beds by straight connected locomotives.

Increasing Need of the Civil Engineer

Now to turn again to the civil engineering aspect of intensive logging as carried on to-day. Operations are constantly increasing in magnitude; ground and settings are now being surveyed with real technical accuracy, instead of by rule of thumb; and most large operators have found that, in order to obtain their product economically, it is imperative that they use the services of a thoroughly competent engineer whose duties are to exploit any particular location or setting, to its highest economical possibilities, along lines such as: — (a) Run-

ning in railroad in the most economical manner, with due regard to cheapness of road construction. (b) Choice of easiest and shortest grade, with regard to economy in subsequent haulage. (c) Location of central yarding point so as to save steam and spare mechanical equipment.

Some large operators are now inland as much as twenty miles. In these cases their last six or seven miles are probably actual heavy grade logging railroad in the timber, whereas there may possibly be some dozen or more miles of mainline from their base camp down to tide water where logs are boomed. These railroads, to-day, are by no means rough and ready, temporary roads. They are 50-pound construction, or better, and are fully and properly ballasted. All curves are run and banked as perfectly as on a mainline trans-continental road. It will therefore be readily seen that this thoroughness and accuracy demands the highest class of construction and supervision.

Power Equipment on Right-of-way Construction

Instead of the hand methods of years ago, we now find the most powerful modern mechanical grading equipment used in the construction of this railroad, consisting of steam and other power shovels and ballast unloaders which form the modern and economical development of the old time methods. This constitutes another sphere in which the advance of mechanical science has served to ease the path of the construction man. Many of these shovels are handling 2,000 cubic yards of material per day, and the road is being constructed at approximately twelve times the speed that was the case in days gone by.

The Logging Engineer

With regard to the engineering future of the logging industry, logging is becoming, or rather, has become comparatively an exact science. Accordingly the United States universities instituted, and we are following closely on this idea, courses designed to evolve a more or less new kind of specialized engineer, who shall be sufficiently instructed mechanically to appreciate and operate, with proper care and economy, the highly modern mechanical equipment used in the woods to-day; he shall also be trained sufficiently as a civil engineer to lay out, operate and maintain main-line, branch and mountain railroad, and he shall, in addition to both these qualifications, be especially intensively trained in forestry. A man of the foregoing calibre sounds almost a super-human proposition, but there seems no doubt that the way the various universities are handling the situation men will be produced whose subsequent efforts will extract from the country the treasure of her raw material, whilst their technical ability will prevent the shameful destruction which is always the penalty of rule-of-thumb methods.

Modern Methods Developed to Avoid Destruction of Standing Timber

This last named aspect is one which in its past was badly mismanaged. In order to log out of any given limits the timber which was considered by the logger big enough to be worth while, a vast amount of immature and smaller timber was smashed beyond use in the process.

With modern mechanical means of to-day, especially with the overhead aerial systems, it is possible to pick timber from any location and yard it into a central point, without touching any of the surrounding timber. In this way, for instance, the smaller hemlock may be taken aerially out of any given limits, leaving the large stand of fir and cedar to be taken subsequently, when the falling of it would incur no damage to the smaller timber. It is emphasized that this saving has only been rendered possible by the judgment of the civil engineer, aided by the resources of the mechanical designer. In such ways as these is professional engineering rendering the country immense service and providing an ever increasing degree of all round economy.

Winnipeg: September fifth, sixth and seventh.

Winnipeg in September

Although the official programme of the Winnipeg meeting is not yet available the details are practically completed, sufficiently so to be able to announce that it will be one of outstanding interest to all members of *The Institute*, and as such, deserves the attendance of every member who can possibly be in Winnipeg at that time.

Arrangements are under way for convention rates which will lessen the cost of travel, which, combined with the assurance of a good programme and attractive social functions, should decide many, who have not already definitely made up their minds, to plan to be in Winnipeg on September 5th, 6th and 7th.

Appreciation of the Engineer

It is not often that the engineering profession receives a tribute and there are few records to show an appreciation of what the engineer is, what he is doing, and what are his possibilities, to compare with that offered by Doctor Frank Crane in a recent issue of "The American City". It is hoped that every member of the profession will read this and while the modesty of the average engineer will forbid it, it affords material for conversation with those not in the profession, and for newspaper publicity, in order that the average man may know better what is owing by him to the engineer. Doctor Frank Crane, whose reputation as a philosopher is growing yearly, says:

"The man of the future will be the engineer.

He is the man who can do things; and is better than the man who owns things.

But the official who will forever be indispensable is the engineer.

The time will come when the President of the United States will be chosen as the man who has the greatest talent and skill in organizing public works. There will be no more politics in his selection than there is now in choosing the master mechanic of a railway or factory.

When a nation goes to war nowadays, that is, when it becomes necessary to exert its supreme collective strength, nobody dreams of selecting the most popular politician or the cleverest speechmaker to lead the armies. It is the man who can get the last ounce of efficiency out of men and metal that is wanted.

Some day the nation will realize that it is continually in a crisis, and that in peace as in war we need the highest order of efficiency and organization.

We need the engineer to arrange the transportation of people and goods from place to place, without waste, without competition, without graft, looking only to the public good.

We need the engineer to get meat, bread, and milk from farm to citizen, without the present inefficient tangle of trusts and middlemen working at cross purposes.

We need the engineer to turn the profit of public enterprise toward building good roads and bridges, instead of enriching a few shrewd manipulators.

We need the engineer to manage a city as economically and smoothly as if it were a manufacturing plant.

We need the engineer to organize the farmers so that all can work together for each and their products be marketed without being preyed upon at every step of the way from farm to household.

Wealth can be taken away from us. But the power to do things cannot be taken away.

The millionaire could go and not be missed. The engineers we cannot spare.

'What availeth all thy wealth?' said the ancient philosopher. 'He that hath better iron than thou will come and take away all thy gold.'

Says H. L. Gantt:

'The man who knows what to do and how to do it is preeminently the engineer. The new world which is being ushered in by the great struggle now taking place is one in which the engineer is destined to be the supreme power, for it is becoming clear that, in future, the man who *owns things* will not be as important a factor in the world as the man *who can do things*'."

Reading this panegyric should give a man an added pride in his profession. But that is not sufficient. This is the information that engineers should keep constantly before those in high places, in order that we may not have again conditions as have existed recently. We know thoroughly trained and capable engineers who have been unable to find positions when the country stands in need of the production their training and experience can effect for the benefit of the country. Too long the engineer has been overly modest and to-day the whole profession is suffering as a consequence. Undue modesty is a curse which has reacted heavily upon the position and standing of engineers.

If the lesson has not been learned, the outlook is not promising, but if we have learned our lesson it is obvious that we should on every possible occasion do a little shouting on behalf of the profession in order that the world at large may really know what engineers have done and are doing, and of the super-important position they occupy in the development of a country such as this, which at the present time is not even in the slightest degree recognized, as was pointed out at the recent meeting in Vancouver.

Legislation in Ontario

Affecting as it does a large percentage of the engineering profession in Canada, the legislation situation in Ontario is of more than passing interest. Following the passing of the Act on June 5th, the chairman of the Advisory Conference Committee, Willis Chipman, M.E.I.C., has prepared a report submitted to his fellow members on the committee, and the secretary, F. R. Ewart, M.E.I.C., has written to the various bodies represented on the committee. The report of the chairman contains a history of the movement in Ontario and is as follows:—

Gentlemen:—

The Act respecting Professional Engineers received its third reading, after a long and tempestuous passage, on June 5th. The Act as passed, however, differs materially from the Bill presented to the House in 1921, and re-introduced in 1922.

There was apparently no organized opposition in the House to our Bill, but it was evident when the Bill was introduced for third reading on May 10th, that a number of influential men in the House would oppose it unless it were amended.

The amendments made by the Special Committee on May 16th seriously weakened the Bill, but left it a workable measure that would have undoubtedly given satisfaction to the professional engineers in the province. It was only during the consideration of the revised Bill that those who opposed it succeeded in reducing the Bill to a registration measure similar to that now in force in the province of Alberta.

For your information, I consider it advisable to present a summarized history of the Bill respecting professional engineering in this province from its inception in 1919 to date.

At the annual meeting of *The Engineering Institute of Canada* in Ottawa on Feb. 12th, 1919, a resolution was passed providing for the formation of a Special Committee composed of one delegate to be appointed by each Branch to consider the question of legislation. This committee met on April 5th, 1919, in Montreal. Every Branch in the Dominion was represented. At the first meeting of the committee it was decided that legislation for professional engineers should be sufficiently broad to include all branches of engineering. Upon this fundamental principle the committee proceeded to draft a model Bill, and at the end of the session, which extended over a peirod of five days, this Bill was completed and a printed copy sent to each member of the E.I.C., with a ballot, which resulted in the approval of the general principles of the Bill.

Although a Dominion-wide Bill would have been preferable, we were advised by high legal authority that this could not be done as legislation of this character was controlled by the provinces.

The model Bill drawn up by the committee was published in *The Journal* of *The Engineering Institute of Canada* in May 1919.

At a meeting of the executive committee of the Ontario Provincial Division of the E.I.C., held in Toronto on November 22nd, 1919, the constitution of an Advisory Conference Committee of representatives of other technical organizations was approved and invitations were extended to the following:—

(1) Canadian Mining Institute,
(2) Canadian Society of Chemical Industry,
(3) American Society of Mechanical Engineers, Ontario Branch,
(4) American Institute of Electrical Engineers, Ontario Branch,
(5) Ontario Association of Architects,
(6) Association of Ontario Land Surveyors.

These organizations accepted the invitation and appointed delegates.

The first meeting of the Advisory Conference Committee was held on March 13th, 1920, and during the year eight meetings were held, the last being on Dec. 8th.

As a result of the deliberations of the Advisory Conference Committee, a Bill was drafted which received the unanimous approval of the committee. It should be mentioned, however, that the architects withdrew from the committee in November, as they had decided to ask for separate legislation for the profession of architecture.

The Bill as amended differed in many details from the draft Bill prepared by the E.I.C. Special Committee in April, but the fundamental principles remained. The Bill as adopted by the Advisory Conference Committee was printed in the Canadian Engineer in the issue of Dec. 23rd, 1920, and was thus made public.

During the early months of 1920, Bills respecting professional engineers based upon the model Bill of the E.I.C., were introduced in the provinces of British Columbia, Alberta, Saskatchewan, Manitoba, New Brunswick and Nova Scotia, and a Bill amending the existing legislation in the province of Quebec. In all of these provinces, excepting Saskatchewan, the Bills were passed.

In January and February 1921 the Advisory Conference Committee sent to the various organizations represented by its membership, the Bill as approved in December, with the request that it be approved by the individual organizations in order that it might be presented to the Legislature at the forthcoming session.

Some of the organizations endorsed the Bill in January, but others not until the latter part of February.

After a conference with Premier Drury on Feb. 17th, it was decided to print the Bill, and send a copy to each Member of the House with a memorandum or report. This was done on March 8th and about the same date Col. A. W. Gray was requested to take charge of the Bill.

On April 6th, 1921, the Bill was given its first reading in the House, the number of the Bill being 208. On April 20th it received its second reading and was referred to a Special Committee of the House comprising nine Members. We then expected, in our innocence, that the Bill would be discussed and disposed of before the House adjourned.

On the morning of April 27th, however, the Government decided to adjourn the House within two or three days and we were advised that it would be necessary to leave our Bill over until the next session, and that in the meantime the Special Committee appointed by the House would consider it and it could be introduced early in the next session.

To meet certain objections to the Bill received from time to time after the House adjourned on April 29th, 1921, a number of minor amendments were drafted by the Advisory Conference Committee for presentation to the Special House Committee.

During November and December 1921 the Canadian Institute of Mining and Metallurgy issued a circular to the Ontario members of their organization accompanied by a printed copy of Bill No. 208 and a ballot. It would appear, however, that very few of their members voted, and the results were not published.

The Special Committee of the House appointed to consider Bill No. 208 met for the first time on Jan. 13th, 1922. After sitting in camera in the forenoon representatives of the Advisory Conference Committee were invited to attend at the House in the afternoon. We had before us Bill No. 208 as printed. We were informed that the Special Committee of the House had in the morning approved of the principles of the Bill and they then proceeded to consider it clause by clause. A number of minor changes were made, the most important being the excepting clauses inserted to meet objections that had been raised.

We understood that the Bill was approved by the committee and that it would be introduced in the House early in the session. We afterwards learned that the Bill was reconsidered by the House Committee on Feb. 1st, when they decided to exempt all mining operations from the provisions of the Bill in deference to the Ontario Mining Association.

The House met on Feb. 14th. The Bill was reprinted as No. 67 with the amendments approved by the House Committee and was placed on the order paper on March 22nd, but did not come up for third reading until May 10th. In the House no serious objections were made to the first seventeen clauses of the Bill. Some Members, however, objected to clause 34; the intervening clauses 18 to 31 not being discussed. The House decided to refer the Bill back to the Special Committee, adding to the committee several members.

The new Special Committee met on May 16th, at which meeting clauses 34 (a) and 34 (b) were struck out, and we understood that it was approved and would be reprinted and again sent to the House.

On May 19th it was referred to the law clerk, who made several verbal changes in the Bill, the most important being the deletion of the following words in clause 43 — "respecting the practice of professional engineering or." He also decided that, as 34(a) and 34(b) had been struck out, clauses 44, 45, 46 and 47 were unnecessary and they were then struck out.

With these revisions the Bill was brought up in the House again by Col. Gray on May 29th. It was then ordered reprinted.

The revised Bill No. 67 was re-introduced on June 5th, and after further mutilation was given its third reading.

The following changes were made:—

Clause 2 — the following words deleted — "unless the context otherwise requires" and "expression."

Clause 34 — Revised to read as follows:—

"Any person in the Province of Ontario who, not being regis-"tered as a member of the association in the Province of "Ontario, or licensed by the association.

"(a) Uses verbally or otherwise the title of professional "engineer, or makes use of any addition to or abbreviation "of such title, or of any words, name or designation that will "lead to the belief that he is a professional engineer or a mem-"ber of the association.

"(b) Advertises or holds himself out in any way or by any "means as a member of the association.

"(c) Shall be liable upon summary conviction by any court "of competent jurisdiction to a fine of not less than $100 nor "more than $200 for the first offence, and to a fine of not less "than $200 nor more than $500 for any subsequent offence".

The Bill as finally passed has been reduced to a registration Bill only.

The Alberta Act provides penalties if any person assumes the title of "Registered Professional Engineer" or assumes any designation that may lead to the belief that he is a Registered Professional Engineer, or member of the Association, or a person specially qualified to practice in any of the branches of professional engineering mentioned in the schedule appended to the Act, also if he acts in such manner as to lead to the belief that he is authorized to fulfill the office of, or to act as a Registered Professional Engineer.

I understand that the Ontario Act as finally passed will be reprinted at an early date, and copies will then be available for distribution.

The sub-committee appointed by you to assist Col. A. W. Gray gave the matter close attention during the session, and the professional engineers throughout the province were not idle.

I also wish to bear testimony to the constant watchfulness of Col. A. W. Gray, A.M.E.I.C., who had charge of the Bill for us.

Respectfully submitted,

(Sgd.) WILLIS CHIPMAN,
Chairman.

June 13th, 1922.

In his letter as secretary, which may be interpreted as expressing the opinion of the committee, Mr. Ewart points out that in view of the fact that all further procedure must now rest in the hands of the provisional council appointed under the Act, the work of the committee was considered to be completed. Those who have followed the activities of the Advisory Conference Committee are unanimous in voicing a tribute to them for their unstinted effort and time unselfishly devoted, having solely in mind the welfare of the profession. Mr. Ewart further shows six advantages to be gained from the present Act:—

(1) Members of the association will be entitled to full recognition under the laws of the other provinces.

(2) It provides for a distinctive designation, which is protected, and which the association can by hard work cause to be recognized more widely by the public as time goes on.

(3) It creates an association which should solidify the professional engineers of Ontario into an effective instrument for carrying the matter further.

(4) All future applications for more restrictive legislation will be made in the name of an organization, which the Legislature has itself created, and which it must therefore fully recognize without question,

(5) Any further concession sought in the future will involve only a short clause or two. It will not be necessary to submit forty clauses or more, each one of which opens the way to some new petty criticism. The advantage of this can be thoroughly appreciated only by those who have had this work in hand.

(6) The lack of any restrictions on practice will enable the association to set a much higher standard for admission to membership than would otherwise have been possible. Under the Bill as proposed it was expected, that no man would be deprived of an established method of livelihood, and thus many men might have to be admitted, for whom the association might later find it very embarrassing to have to stand sponsor.

Continuing, Mr. Ewart said:—

"It was fairly apparent to those who followed the course of the Bill through the House, that our complete desires would never be met at one attempt so long as the House is constituted as at present. Nor was there any reason to feel that it would be any more possible even if a change of government should occur The opposition was not based on any special class prejudice, but came from all classes of members, political and occupational. The only conclusion to be reached, therefore, is that the professional engineers of Ontario will only attain their desires by *working* for them. In the new association we have a medium for such work, that we have never had before."

A Tribute to Peterborough Branch

The position occupied by the Peterborough Branch in the eyes of the community is illustrated by the following editorial comment which appeared in "The Evening Examiner" of Peterborough, on April 8th last.

A Live Organization

The Peterborough Branch of *The Engineering Institute of Canada* has earned the reputation during the past winter of being a thoroughly alive organization, which has been responsible for bringing before the people of Peterborough a programme of educative addresses that have been a benefit to all who have had the pleasure of hearing them. Their enterprise was once more revealed on Thursday night when, thanks to *The Engineering Institute*, a large number of citizens was given an opportunity of being present at a demonstration of the latest triumph of science, wireless telephony. The occasion was the first public test in Peterborough of the radio, and the result was an unusual experience, for those who attended listened to snatches of concert programme from Pittsburg and other cities hundreds of miles away. The capabilities of the radio 'phone were satisfactorily demonstrated, and the kindness of *The Engineering Institute* in making the arrangements for this unique event and inviting the public to be present was thoroughly appreciated. Those who were in attendance on Thursday night will wish the engineers every success in their organization, and will hope that their educational work, which has been so well carried on during the last few months, will continue to give the public a chance to come into contact with the latest developments in the world of science.

PERSONALS

E. R. Woodward, Jr.E.I.C., has accepted a position with Ledoux and Company, metallurgical analysts, in New York City.

F. T. Julian, Jr.E.I.C., is with James Vance, A.M.E.I.C., on road construction on the provincial highway near Woodstock, Ontario.

J. W. Lewis, Jr.E.I.C., is with the Canadian Pacific Railway as transitman on the Woodstock division at Woodstock, N.B.

F. H. Dentith, S.E.I.C., of Halifax, Nova Scotia, has been appointed assistant in chemistry at the Halifax Academy for the coming term.

D. S. McPhail, Jr.E.I.C., is at present located at Fuerto Barrios, Guatemala, C.A., with the engineering department of the United Fruit Company.

M. J. MacMillan, Jr.E.I.C., of Marion Bridge, N.S., is now located at McComas, West Virginia, as assistant to the chief engineer, of the American Coal Company.

Captain J. H. Edgar, A.M.E.I.C., was transferred a few months ago from Montreal to Winnipeg, where he is inspector of materials for the Canadian National Railways.

George Hemmerick, A.M.E.I.C., has been appointed instrumentman on road work for the Ontario Department of Public Highways between New Hamburg and Kitchener, Ontario.

F. H. Kitto, M.E.I.C., is on an exploratory trip in the Digby district of Nova Scotia. Mr. Kitto has recently been made a fellow of the Royal Geographical Society.

Edward C. Little, A.M.E.I.C., formerly construction engineer with D. G. Loomis and Sons, Montreal, has been appointed to the staff of the Divisional Engineer's office of the Welland Ship Canal at Thorold, Ontario.

J. B. Hayes, A.M.E.I.C., a member of the Halifax Branch Executive, lately on the engineering staff of the Nova Scotia Tramways and Power Company, has been transferred to the Boston office of Stone and Webster.

John O'Neill, A.M.E.I.C., of Fredericton, New Brunswick, has recently accepted the position of field engineer on construction with the engineering department of the St. Lawrence Paper Company at Three Rivers, Quebec.

J. H. Thompson, A.M.E.I.C., electrical engineer and chief of the wireless branch of the Radio Telegraph, Department of the Naval Service, has resigned to enter the service of the Marconi Company of Canada, at Montreal.

H. W. Tye, A.M.E.I.C., who was formerly with the C.P.R., at Acme, Alberta, in charge of the construction of the Acme-Drumheller branch is now with the Lacombe and North Western Railway Company at Lacombe, Alta.

W. C. Murdie, A.M.E.I.C., geodetic engineer of the Geodetic Survey Branch, Department of the Interior, Ottawa, is in charge of the triangulation work which is being carried on by the Federal Government in the lower St. Lawrence district.

George H. Carson, Jr.E.I.C., field engineer for the Three Rivers Pulp and Paper Company in Montreal, has recently been transferred to Three Rivers, Quebec, in connection with the work of the newly formed St. Lawrence Paper Mills, Limited.

George E. Newill, M.E.I.C., has been appointed sales manager and engineer in charge of new developments with the Dominion Engineering Works at Montreal. Mr Newill was formerly general manager for the Robb Engineering Works, Ltd., at Amherst, N.S.

John Stephenson, A.M.E.I.C., formerly of the engineering staff of the Nova Scotia Steel and Coal Company is now on the staff of the engineering department of the Bethlehem Steel Corporation, in Bethlehem, Pa., in charge of mill improvements and new construction.

Alex. Roberts, A.M.E.I.C., has been appointed to the engineering staff of the Canadian and General Finance Company Limited, 410, Dominion Bank Building, Toronto, Ont. Mr. Roberts was formerly on the staff of the William Hamilton Company, Limited, at Peterborough, Ont.

A. W. Swan, Jr.E.I.C., until recently on the staff of *The Engineering Institute of Canada* at headquarters, has accepted a position with the Sterling Telephone Company, Dagenham, Essex, England, and has been placed in charge of special statistical work in connection with production control.

H. S. Van Scoyoc, M.E.I.C., manager of the Publicity Department of Canada Cement Company, has been elected vice-president of the Associated Advertising Clubs of the World, the offices of which are at 110 West 40th Street, New York City. This association represents the various local publicity organizations of the country.

William W. Crouch, A.M.E.I.C., of the staff of Black and Veatch, consulting engineers, Kansas City, Montana, has been, until recently, located at Mexico, Montana, and on the completion of the work at that place was transferred to Perry, Oklahoma, in connection with the construction of a sewerage system and disposal plant for the city.

Major J. A. Duchastel, M.E.I.C., chairman of the Montreal Branch, city engineer and manager of Outremont, Quebec, in his capacity as president of the Automobile Club of Canada delivered an address before the Rotary Club of Montreal on Tuesday, July 18th, on "Roads and Streets of Montreal and Vicinity, Past, Present and Future".

F. P. Vaughan, M.E.I.C., of St. John, New Brunswick, has the honour of being the first person to successfully operate a radio broadcasting station in the province of New Brunswick. On May 31st last, the new experimental station, which has just been installed in Mr. Vaughan's laboratory in St. John, was for the first time successfully operated to provide a radio entertainment to the local enthusiasts.

George F. Dalton, A.M.E.I.C., of the Geodetic Survey Branch, Department of the Interior, has recently completed the precise levelling and triangulation control for the topographical survey of the city of Hamilton. This work is being undertaken by the Geodetic Survey in various cities, in order to provide a base, from which a complete topographical survey of the city may ultimately be made.

Norman Marr, A.M.E.I.C., supervising hydraulic engineer of the Dominion Water Power Branch, Department of the Interior at Ottawa, was the recipient of the degree of C.E., at the June Convocation of the University of Toronto. Mr. Marr is a graduate of the University of Toronto and was for a number of years on the engineering staff of the Trent Valley canal, located at Campbellford, Ont.

J. M. Wilson M.E.I.C., of Toronto, received the degree of C.E., at the Convocation last June, from the University of Toronto. Mr. Wilson graduated in civil engineering from Varsity in 1908, and was for a number of years engaged in municipal work, both in Toronto and Moose Jaw. He was appointed district engineer for the Federal Department of Public Works at Toronto in 1914, which position he still holds.

Boyd Candlish, A.M.E.I.C., formerly chief engineer with Herbert Morris Crane and Hoist Company, Niagara Falls, Ont., is now manager of the Detroit branch of Herbert Morris, Incorporated. Mr. Candlish is still acting in a consulting capacity on the design of special hoisting motors, magnetos, brakes and controllers, for both Herbert Morris Crane and Hoist Co., and Herbert Morris, Incorporated.

C. G. Cline, A.M.E.I.C., assistant engineer on the staff of the Ontario Hydrometric Survey, who is in charge of the hydrometric work on the Niagara river for the Dominion Water Power Branch received the degree of C.E., at the June Convocation of the University of Toronto. Mr. Cline, whose office was formerly in Ottawa, has recently been transferred to a new office, room No. 6, Ontario Power Company, Niagara Falls, Ont.

Eugene Vinet, A.M.E.I.C., has been appointed assistant electrical engineer of the Middle West Public Utilities, headquarters, Chicago. Mr. Vinet's departure from Montreal will be regretted by many in the engineering profession. While here he was connected with the Shawinigan Water and Power Company and took an active interest in the engineering profession. He was secretary of the Canadian Electrical Association.

J. B. Challies, M.E.I.C., director of Water Powers, Department of the Interior, is on a western inspection trip in connection with the work of the Department. While on Calgary recently, Mr. Challies was asked to attend a special meeting of the Branch and the members were in this way afforded an opportunity to secure first hand information regarding the work of the Committee on Policy, a report of which was published in last month's *Journal*.

Thomas H. Dunn, M.E.I.C., is among the members of *The Institute* who have recently been honoured by the University of Toronto with the degree of C.E. As a member of the class of 1893 Mr. Dunn received his diploma in civil engineering from the old "School of Practical Science". In 1906 he was admitted to practice as an Ontario Land Surveyor. Ever since graduating Mr. Dunn has been engaged in reclamation work, in connection with which a number of valuable reports of his have been published by the Federal Government.

E. L. Cousins, A.M.E.I.C., who has recently had the degree of C.E. conferred upon him by the University of Toronto, is an honour graduate of the class of '06 of the School of Practical Science. In 1907 Mr. Cousins obtained his degree of B.A.Sc. after a post-graduate course at "The School". During his undergraduate days and for a number of years after graduation he was connected with railway engineering on location, maintenance and reconstruction. He is at present chief engineer of the Toronto Harbour Commission.

R. G. Swan, A.M.E.I.C., engineer in charge of the British Columbia Hydrometric Surveys for the Dominion Water Power Branch, Department of the Interior, recently received the degree of C.E., from the University of Toronto. Mr. Swan graduated from Varsity in 1909 and since graduating has been continuously connected with hydro-electric work, first as concrete inspector with the Ontario Power Company at Niagara Falls, then as engineer on power surveys on the Winnipeg river for the Reese Engineering Company, and later in charge of power investigations in British Columbia, which position he still holds.

J. A. Beauchemin, A.M.E.I.C., has recently been appointed engineer in charge of the engineering department of the Donnacona Paper Company, Limited. Mr. Beauchemin is a graduate of Montreal Polytechnic in Applied Science in 1911, and in the same year was appointed field engineer with the Department of Public Works at Ottawa on the Ottawa River Storage investigations. In 1919 he resigned from the Federal service to accept the position of hydrometic engineer with the Riordon Company, Limited, at Mattawa, Ontario, from which company he severed his connection in 1921 to take charge of power surveys for the Donnacona Paper Company.

Lesslie R. Thomson, M.E.I.C., has been receiving congratulation as designer of the sailing yacht "Antaeis", which, on Saturday July 8th, qualified in the final trial races at Montreal to represent the Royal St. Lawrence Yacht Club in the International Yacht Races against the White Bear Yacht Club at St. Paul, Minnesota, on July 29th, 31st and August 1st. The "Anaetis" was built on Mr. Thomson's design by the St. Lawrence Yacht Club Company, Dorval, Quebec, for a syndicate of members of the Royal St. Lawrence Yacht Club. Among the crew chosen to sail the "Anaetis" at St. Paul is Donald A. White, A.M.E.I.C. F. P. Shearwood, M.E.I.C., who is an authority on yacht design, has been appointed as one of the judges for the races at St. Paul.

Hugh Chambers, A.M.E.I.C., is now acting in the capacity of Canadian Manager for G. D. Peters and Company, Limited, of London, England, who have recently opened up offices in the New Birks Building, Montreal. The Peters Company are manufacturers of rolling stock equipment and selling representatives for various engineering specialities. Mr. Chambers is a graduate of McGill University and prior to going overseas had a number of years experience in mechanical engineering with the Nova

Scotia Steel and Coal Company, with which company he worked up to the position of efficiency engineer. On his return from overseas he was engaged in a consulting capacity in connection with power-plant efficiency. He was later sales engineer and then chief engineer of the General Combustion Company of Canada. Mr. Chambers' past experience will undoubtedly be valuable in connection with his new work.

Major H. J. G. McLean, M. C., A.M.E.I.C., enters Consulting Practice

Major H. J. G. McLean, M.C., A.M.E.I.C., has opened an office as consulting engineer at the Temple building in Brantford. Major McLean has had a wide experience in pulp and paper mill work, having laid out the mills for the Abitibi Pulp and Paper Company; the Dalhousie Lumber Company; the Powell River Pulp and Paper Company; and the Wayagamack Pulp and Paper Company. For eleven years he was with the Waterous Engine Works in Brantford, starting in as an apprentice and rising to be chief draughtsman, in which position he had responsible charge of the design of engines, boilers,

MAJOR H. J. G. McLEAN, M.C., A.M.E.I.C.

road rollers, fire fighting machinery, saw mills, pulp wood machines and layout of the mills. From 1915 to 1918 the Major was with the C.E.F., serving as second in command of the 125th Bn., which was recruited in Brantford. He served with distinction in France, winning the Military Cross. He was afterwards retained as educational officer with the 4th Bn., and served another year with the D.S.C.R., as deputy assistant director for eastern Ontario. On his discharge he entered the employ of the Dominion Engineering Works, designing paper-making machinery and hydraulic turbines.

Beaudry Leman, A.M.E.I.C., appointed Director of Shawinigan Water and Power Company

Beaudry Leman, A.M.E.I.C., was appointed to the vacancy on the directorate of the Shawinigan Water and Power Company, caused through the retirement of S. Roy Marshall of London, England. Mr. Leman commenced his engineering career in the employ of the Shawinigan Company which he joined twenty-two years ago, in the early stages of the construction work, and for six years devoted his time to the development of that important hydro-electric enterprise, at the same time supervising the public improvements which have contributed to make of Shawinigan Falls a model town. He was elected Mayor of Shawinigan Falls for three successive periods of two years.

In 1906 Mr. Leman took an active part in the establishment and construction of the railway which connects the city of Three Rivers with the towns of Shawinigan Falls and Grand' Mere. During his professional career Mr. Leman identified himself with hydro-electric enterprises in the province of Quebec, having made the preliminary surveys for the construction of the Cedars Rapids Manufacturing and Power Company's plant and having also made several reports in connection with water powers in the province.

He was a member of the Electric Service Commission of the city of Montreal, established for the purpose of placing underground electric wires. Mr. Leman, represented for some years a group of Belgian and French Banks interested in Canadian enterprises. In 1912 he entered the service of the Banque d'Hochelaga and is now general manager of that institution.

EMPLOYMENT BUREAU
AND
MEMBERS' EXCHANGE

To make this department more valuable it is proposed that in future advertisements of situations vacant should state salary, and give details of requirements.

Situations Wanted

Mechanical Engineer

Graduate in mechanical engineering, Toronto University, age 26, single, desires position offering experience long this line. Has had some practical experience with gasoline and gas engines and machine shop work. Box No. 108-P.

Electrical Engineer.

Situation wanted by a graduate in electrical engineering, B.Sc., Nova Scotia Technical College, 1921. Has just completed fifteen months in test department of the Canadian General Electric Company, Peterborough, Ontario. Desires location further east. Previous experience consists of four summers at telephone switchboard installation, three summers with the Northern Electric Company, and one with the Automatic Electric Company. Age 23. Unmarried. Apply to Box 109-P.

BRANCH NEWS

Sault Ste. Marie Branch

Geo. H. Kohl, A.M.E.I.C., Acting-Secretary.

At the regular monthly meeting of the Branch on Thursday, May 25th, a number of interesting talks were given on the subject of local dock and pier construction. The Sault Ste. Marie ship canal piers were dealt with by J. W. LeB. Ross, M.E.I.C. This is a matter on which Mr. Ross is thoroughly at home as he is superintendent of the Canadian canal and locks. C. H. E. Rounthwaite, A.M.E.I.C., Member of Council, spoke on the Algoma Central Railway's coal dock construction. W. S. Wilson, A.M.E.I.C., and B. E. Barnhill, M.E.I.C., described the docks of the Algoma Steel Corporation, giving particulars of certain changes it had been found necessary to make in their construction.

Lethbridge Branch

G. S. Brown, A.M.E.I.C., Secretary-Treasurer.

On Saturday, June 23rd, a meeting of the Lethbridge Branch was called to hear an address by Fraser S. Keith, general secretary, who was returning from the British Columbia professional meeting held in Vancouver.

After dinner solos were rendered by R. S. Lawrence, A.M.E.I.C., W. Meldrum, and A. Branch. C. M. Arnold, M.E.I.C., chairman, on behalf of the Branch, extended to Mr. Keith a hearty welcome and expressed appreciation in his paying Lethbridge a visit.

Mr. Keith in opening his address, reminded those present of his visit of a year before, at which time the idea of forming the Branch was conceived, and, in remarking on the growth, stated that this was the youngest Branch in *The Institute* and had made a record due to the interest and enthusiasm shown by the members. He then gave a good insight into the work of the Committee on Policy, which was very instructive and interesting.

Quebec Branch

Hector Cimon, A.M.E.I.C., Secretary-Treasurer.

The annual meeting of the Branch and the election of officers took place at the Chateau Frontenac on the 22nd of May.

The officers elected for the year 1922-1923 are:—

President, A. R. Décary; vice-president, A. B. Normandin; sec.-treasurer, Hector Cimon; councillors, L. C. Dupuis, T. E. Rousseau, *ex-officio:* S. S. Oliver, J. E. Gibault; legislative committee, Alex. Fraser, J. E. Gibault, A. B. Normandin; nomination committee, J. E. Gibault, Hector Cimon, L. A. Dubreuil; conference committee, president, Zachée Langlais; vice-president, Alex. Fraser; secretary, Hector Cimon; A. R. Décary, A. B. Normandin, S. L. DeCarteret, T. E. Rousseau, Arthur Fournier.

In the course of this meeting, an interesting causerie on "Aerial Electric Constructions" was given by Alex. Larivière, A.M.E.I.C., engineer for the Public Service Commission of the Province of Quebec.

Aerial Electric Constructions

Mr. Larivière briefly mentioned that nature has favoured the Province of Quebec with numerous water powers and that many plants have been erected for the production of electricity. He then discussed at length the means of conveying this electricity to the desired points. He gave ample details on transmission lines operating under high voltages used between power plants and distribution stations, and on distribution lines at low voltages which transmit electricity to the consumers. Signal lines, which comprise telephone, either public or private, telegraph and fire alarm systems, formed also an important part of the causerie and the speaker finally concluded in reviewing the progress made in this branch of engineering.

The audience warmly applauded Mr. Larivière and supported the vote of thanks proposed by Z. Langlais.

Calgary Branch

J. A. Spreckley, A.M.E.I.C., Secretary.
Floyd K. Beach, A.M.E.I.C., Branch News-Editor.

Mr. Keith's Visit.

On his way back from Vancouver the General Secretary paid a short visit to Calgary and was entertained to luncheon at the hotel Palliser on Friday, July 23rd. He was accompanied by Major A. A. Young, A.M.E.I.C., who conveyed greetings from the Winnipeg Branch, and there was a good attendance of those members whose duties do not compel them to be in the field at this time of the year.

After referring to the Good Roads Conference at Victoria, Mr. Keith gave a clear résumé of the recent findings of the Policy committee, and the circumstances leading up to these valuable recommendations. He commended the proposals to the careful consideration of the Branch and pointed out the recent widening of the scope of *The Institute* to include the social and economic welfare of the members, in addition to protecting their professional status. Steps are being taken to bring the Branches into closer touch with the Council, and to associate every member with a local Branch. He pointed out the difficulties encountered in attempting to prepare a schedule of remuneration and classification, and gave one instance where such a scale would have been appreciated by a city executive, engaged in reclassifying his staff. Professional recognition depends in some measure on remuneration, but can be greatly helped by education of the student members in ethics and the practice of public speaking. A vote of thanks was accorded on the motion of Councillor G. W. Craig, M.E.I.C., and the opportunity of discussing *Institute* affairs was much appreciated.

Institute Policy.

J. B. Challies, M.E.I.C., the chairman of the Policy Committee, spent a few hours in Calgary on Wednesday, July 12th, and the opportunity was taken for him to meet the executive and Policy committees of the Calgary Branch, to discuss *Institute* affairs in an informal way, at luncheon in the Board of Trade rooms. Mr. Challies briefly outlined the main objects of the recent report prepared by the Policy committee, and pointed out that while recent developments have brought the Branches into closer touch with Headquarters, it is now proposed to bring in the unattached members, so that they may be kept in close touch with the work of *The Institute.* He mentioned a few cases in which *The Institute* has used its influence to help certain classes of its members, and those who attended the luncheon now have a closer appreciation of the good work which is being done by the Council in furthering the interests of the membership as a whole.

William Pearce Irrigation Project.

E. F. Drake, Associate E.I.C., director of the Reclamation Service, has been making his annual visit to the west this summer, and has made a personal inspection of the large area covered by the proposed North Saskatchewan Irrigation Project. He was accompanied by D. W. Hays, M.E.I.C., as consulting engineer, and V. M. Meek, A.M.E.I.C., the acting commissioner of irrigation. The proposal is generally known as the William Pearce Irrigation project, and provides for water to travel a distance of 400 miles by natural and artificial channels, from the foothills in the west, as far as Saskatoon. No other irrigation system on the continent carries water for this distance, but the scheme is understood to be practical from an engineering standpoint, and the most important question which enters into the consideration of the whole project is the actual demand, by the farmers in the area affected, for irrigation. In some of the districts farthest from the source of supply it is questionable if the farmers are all agreed on the need for irrigation.

Informal Dinner.

The Calgary Branch was fortunate in being given an opportunity to welcome Brig.-Gen. C. H. Mitchell, M.E.I.C., Dean of the Faculty of Applied Science and Engineering of the University of Toronto, at an informal dinner, held at the Board of Trade rooms on Monday evening, July 10th. Although very short notice could be given there was a very gratifying turnout of the members. A special effort was made to notify all graduates of the Toronto Faculty of Applied Science and Engineering, and a good percentage of these were present. After the dinner any formality which might have existed was laid aside, acquaintances were renewed, reminiscences of undergraduate days were indulged in, and college scraps fought over once again. The old school yell was given with a vim, and then the "Psalm of Life", dear to all "School Men", was sung. Parodies on popular songs worded to suit the occasion followed at intervals and helped to round off the social part of the evening's programme. General Mitchell, M.E.I.C., was kept very busy renewing old acquaintances and meeting new ones in his well-known genial manner.

The meeting was called to order about nine o'clock by the chairman of the Calgary Branch, P. J. Jennings, M.E.I.C., and the guest of honour, General Mitchell, gave a very interesting address. The speaker outlined briefly the history of engineering in Canada in its various branches throughout the past fifteen or twenty years, and stressed the importance of the work of engineers to the interests of not only the community in which they worked, but also of the nation and the Empire as a whole. He urged that they owed a debt to the country in which they had received their education and training, and they could best pay if off by taking a more active part in civic affairs, or anything which would help to build up their community, and the country in general. The General went on to outline, in an interesting manner, the history of the various courses in the Faculty of Science of the University of Toronto, the civil engineering course, from point of number of students entered, having held first place for a number of years, but since the start of the war certain conditions brought other lines, notably chemical engineering, to the fore, so that last year's civil engineering had dropped to fourth place. The General expressed his opinion that upon the return of normal times he anticipated there would be a greater demand for civil engineers and a consequent increase in the number entering that course. The speaker's remarks with respect to the additions which have been made to the courses in the Science Faculty at Toronto in recent years were of great interest, since the graduates present at the meeting had finished their training, they were of special interest to them, and all were agreed that a decided improvement had been effected by these additions, as from the experience of every graduate, the lack of them in his own course proves more or less of a handicap. The additions included were technical English, law of contracts, and a systematic training in public speaking.

In commenting upon general business conditions throughout Canada, General Mitchell was very optimistic. He stated that things were steadily improving, and expressed the opinion that within the next two years they would return to normal. Believing this, he warned engineers that they should be ready to broaden out as opportunities arose, and keep pace with the changing of the times.

L. C. Charlesworth, M.E.I.C., chairman of the Irrigation Council of Alberta, fortunately happened to be passing through the city and was able to attend the meeting and take part in the discussion.

P. M. Sauder, M.E.I.C., of the Lethbridge Branch, moved a vote of thanks to the speaker in a few well chosen words, in which, on behalf of the graduates in particular, he expressed the pleasure felt in renewing acquaintance with General Mitchell, and hearing at first hand, and in this intimate way, of the activities of the "Old Red School House". G. W. Craig, M.E.I.C., city engineer of Calgary, seconded the motion, speaking more particularly on behalf of those present who were not graduates of Toronto.

A short discussion followed, in which a number of the members and graduates took part, and what proved to have been one of the most successful meetings of the Branch adjourned at 11 o'clock.

Cape Breton Branch

Kenneth G. Cameron, A.M.E.I.C., Secretary-Treasurer.

Regular meetings of the Branch have been suspended according to custom, during the summer months, but seasonable opportunities for visits or outings are being taken.

H.M.S. "Raleigh", flagship of the North Atlantic Squadron, recently called at Sydney Harbour, and by arrangement with Vice-Admiral Pakenham, the members of the Branch paid a visit to the ship, where they were received by the engineer commander and his staff. Members were accompanied by ladies, and on arrival on board, divided themselves into groups, which, each conducted by one of the staff, had every opportunity granted them of investigating the points of interest. Although classified as an improved light cruiser, the "Raleigh" is no mean boat and, in equipment, represents the most modern practice that has hitherto been stationed in these waters. She is a turbine driven, oil-burning vessel, 600 feet in length, developing 31.5 knots at 65,000 to 70,000 h.p. For those members interested in mechanical design, the visit was of great interest, and all too short.

Several changes have occurred recently among the Branch membership. D. F. MacIsaac, A.M.E.I.C., member of the executive since the formation of the Branch, and one of the promoters, and hard workers during its infant stages, has left this district for Upper Canada. C. C. Curtis, M.E.I.C., general manager of the Cape Breton Electric Company, has been appointed to the Executive committee for the remainder of Mr. MacIsaac's term, John Stephenson, A.M.E.I.C., is now with the engineering department of the Bethlehem Steel Corporation, Bethlehem, Pa. H. A. Roberts, Jr.E.I.C. and Clarence MacKay, Jr.E.I.C. both formerly of the Dominion Iron and Steel Company, are now with the Canadian Bridge Company, Walkerville, Ont.

Hamilton Branch

W. F. McLaren, M.E.I.C., Secretary-Treasurer.

The Hamilton Branch is particularly interested in a new industry which is locating in Hamilton for the purpose of manufacturing fire brick. The construction of the new plant for the Canadian By-Products Company, Limited, in connection with this undertaking, is in charge of E. Howard Darling, M.E.I.C., consulting engineer, of Hamilton, Ontario, who is also a director of the compapy.

Sewage Disposal

The city of Hamilton is wrestling with the problem of sewage disposal. The rapid expansion of the city has far outgrown the present sewage disposal plants and it is estimated that fully two-thirds of the sewage goes into the bay without treatment. In order to cope with future needs the City Council is endeavouring to select a firm of consulting engineers to furnish expert advice.

Halifax Branch

O. S. Cox, A.M.E.I.C., Secretary-Treasurer.

A special meeting of the Halifax Branch was held in the Nova Scotia Technical College, June 22nd, 1922, with the vice-chairman, Ira P. MacNab, M.E.I.C., in the chair, and J. B. Hayes, A.M.E.I.C., acting as secretary, at which a talk on the subject "Valuations", was given by Edward L. Moreland, of the firm of Jackson and Moreland of Boston. The meeting was called to order at 8.15 p.m. with an attendance of approximately one hundred including a number of non-membership guests

Mr. Moreland explained that he had not prepared a formal paper but would outline his subject and then throw the meeting open for questions, trusting that the answers to the questions would bring out more detailed description of methods employed. The valuations are made in general for two purposes:—

(1) Valuations for bankers in order to justify the issuing o bonds, securities, etc. In this case a few qualified engineers spen a few days in sizing up the property and reporting.

(2) Valuations of public utilities for rate making purposes In this case a much more detailed study of the property mus be made.

Mr. Moreland sketched the history of public utilit regulation, showing how procedure had changed from a competitive period of non-regulation to our presen system of commissions. The fundamental thing is rate changed; and to fix this the value of the plant must b known. This cannot satisfactorily be determined fron the company's records, as frequently the existing concer is the survivor of several old ventures, or an amalgamation Hence the necessity of the system of estimating values

A number of systems are in vogue, such as:— (a) Reproduction cost; (b) original cost; (c) depreciate value. In the United States the courts have laid dow the principle that valuations must be considered fron several bases. The process Messrs. Jackson and More land uses is: — (1) Make an inventory of the propert from the company's records and check them. (2) Appl to this inventory unit costs, similar to ordinary construc tion costs. To obtain new costs is relatively simple a present costs are known. More difficult it is to go bac to actual time of construction, but company's record are helpful.

There are two ways to arrive at "depreciation".

(1) *Theoretical.* What may theoretically be expected b assigning a probable useful life and using a percentage. Th fact that plant may become obsolete is a factor in estimatin probable life.

(2) *Depreciation by Inspection.* Our opinion is — fair valu for rate-making purposes is the amount of money put in — fu value as long as property is kept in good working condition. property is not kept up, a sum should be deducted equal to tha required to bring the property up to good condition. This woul be carefully distinguished from depreciation. Many disagree wit this view and think that depreciation should be deducted.

Mr. Moreland sketched the method used in determ ining the indemnity that should be paid by German for all physical damage done in the allied countries. H was technical adviser to the commission. Unit costs wer used, and in the case of destroyed towns, "a cost pe capita" was established by estimates of the costs o various sized undamaged towns adjacent to the devastat

ed area. The chief result of the investigation was to fix the *proportion* of the damages among the Allied nations, rather than the gross amount.

The meeting was then thrown open for discussion and Mr. Moreland answered questions asked by a number of the members. A vote of thanks to Mr. Moreland was moved by C. E. W. Dodwell M.E.I.C., and seconded by L. H. Wheaton, A.M.E.I.C.

Ottawa Branch

F. C. C. Lynch, Associate E.I.C., Secretary-Treasurer.

The Engineer's Bill is passed, and as a Branch the engineers of Ottawa congratulate the Toronto members on their effective work. Interest is now centred in the action to be taken by the provisional council towards the organization of the new Association of Professional Engineers. While the Bill does not, and could hardly be expected to at first, grant all the powers requested, Ottawa recognizes it as a tremendous step towards the goal which the profession has for a long time been working.

The Year Book of the Ottawa Branch has just been issued, and shows a considerably increased membership, and much activity on the part of the Branch.

OTHER SOCIETIES NEWS

American Society of Civil Engineers Annual Convention

The fifty-second annual convention of the American Society of Civil Engineers, which was held at Portsmouth, New Hampshire, on June 21st and 22nd, provided a programme of very interesting and instructive technical papers and a diversity of pleasurable excursions and other entertainments. Among the contributions to the technical programme were the following papers by members of *The Engineering Institute of Canada:*

"Problems in Connection with the St. Maurice River Regulation" by O. O. Lefebvre, M.E.I.C., chief engineer of the Quebec Streams Commission.

"The Gouin Dam on the St. Maurice River" by James H. Brace, M.E.I.C., vice-president of Fraser Brace and Company, of Montreal.

Canadian Engineering Standards Association

The Sub-Committee on Rating and Testing of Electrical Machinery held its first meeting in Ottawa on June 16th, Prof. E. G. Burr, A.M.E.I.C., in the chair.

The chairman pointed out that the sub-committee had been formed to consider the advisability of the adoption or formulation by the C.E.S.A., of Canadian standardization rules for electrical machinery, covering the same ground as and preferably based upon, the rules of the American Institute of Electrical Engineers. As a result of preliminary correspondence, it appeared that practically all the members of the sub-committee were in favour of the adoption of the A.I.E.E. rules, subject to such amendments or changes in arrangement as may be found desirable. This decision was confirmed by the meeting. Discussion followed as to the best organization for the work, and three Panels were appointed to deal respectively with the rules for rating and testing of: — (1) Large motors, generators, and rotating machinery operating under controllable conditions; (2) Industrial sizes of motors and generators working under ordinary manufacturing or operating conditions; (3) Transformers of various types.

The existing Transformer Sub-Committee would, of course, be consulted as regards the work of Panel No. 3.

Consideration was given to the best method of keeping the sub-committee in touch with American committees working along the same lines, and it was decided that the fullest possible co-operation should be arranged for through the American Engineering Standards Committee.

Western Canada Irrigation Association

The sixteenth annual irrigation convention of the Western Canada Irrigation Association is being held at Maple Creek, Saskatchewan, July 26th and 27th, and at Brooks, Alberta, July 28th and 29th. The Western Canada Irrigation Association includes in its membership a large number of members of *The Engineering Institute of Canada*, many of whom occupy outstanding positions in irrigation development in the Dominion.

Under the Association's constitution *The Engineering Institute* is entitled to three delegates nominated by the Council, and two from each of the western provinces, Saskatchewan, Alberta and British Columbia.

In addition many of the delegates of other organizations will include members of our own *Institute* so that a large percentage of the personnel of these gatherings is included from our own membership.

The executive of the Association includes A. S. Dawson, M.E.I.C., Calgary, V. Meek, A.M.E.I.C., Calgary, and G. N. Houston, M.E.I.C., Lethbridge. An account of the convention will appear in the next issue of *The Journal*.

Trade Publications

The Industrial Diamond and Its Uses.—A booklet of particular interest to engineers has recently been issued by Furniss Clarke and Company, of 32, McGill College Avenue, Montreal, which throws an altogether new light on the uses to which diamonds may be put. In this publication is given a short historical sketch of some of the more famous diamonds together with some details of interest regarding the more important diamond mines, while the main part of the text is devoted to the uses of the industrial diamond and the care required in setting or re-setting the diamond in the tools in which it is used.

Stock List of Steel.—The Dominion Bridge Company, Toronto office, has forwarded a copy of their current Stock List, of steel shapes and other metal products for immediate shipment. The booklet contains several pages of weights, safe loads for beams, channels, angles, etc., and general information. They will be pleased to forward members a copy on request.

CORRESPONDENCE

Reforming the Calendar

Vancouver B.C., July 12th, 1922.

Editor, *Journal:*

Dear Sir:—

Recent years have witnessed a rapidly growing movement among scientific, ecclesiastical and legislative bodies in Europe and America towards calendar reform. English speaking nations use the Gregorian Calendar, but the Julian, Arabic, Jewish and Chinese calendars serve over twice as many people, and even this is not the complete list. From this great variation in the almanac and the closer communication between nations, has arisen the desire for some way of relieving the confusion of dates and day names, with its contingent complications.

Local interest, to members of the Vancouver Branch, is added because the author of the most widely endorsed plan, Moses B. Cotsworth, F.G.S., F.S.A., F.C.A., though a native of York, England, is a resident of New Westminster, B.C., and a staunch Canadian. Mr. Cotsworth's high attainments are well known, through his researches in the field of commerce and his valuable works such as "Railway Maximum Rates", (the British standard) or, "Direct Calculators" and "Reciprocals" which are widely used by professional and scientific men, and the government departments of nearly all nations.

He commenced his research in the field of calendar reform in 1894 after much laborious and painstaking investigation of ancient and modern systems of time measurement, involving lengthy study in many countries and localities, he wrote a book of about five hundred pages entitled "The Rational Almanac", which was published in 1905, followed a few years later by a smaller book, "Time to Fix the Year", which embodied a review of his discoveries and a definite plan to reform the calendar. This scheme was given the unqualified approval and support of the late Sir Sanford Fleming, K.C.M.G., the originator of "Standard Time", who introduced it to the Royal Society of Canada. This body, after careful investigation, passed a resolution at its annual meeting in 1912, endorsing Mr. Cotsworth's proposal, and afterwards petitioned the Canadian Government to request the Imperial Government to call an international conference at an early date. The Canadian Government, subsequently endorsed both the petition and Mr. Cotsworth's plan.

The war dampened the interest in this question for several years, but on February eighth of the present year, a national convention was held at Washington, D.C., to discuss calendar reform, at which eleven proposals were presented for consideration. Mr. Cotsworth's scheme, known as, "The International Fixed Calendar" showed such marked superiority, that a unanimous resolution was passed, endorsing it as the simplest, most conveniently arranged and most desirable of all the plans submitted, and recommending its adoption by all the law making bodies of the nations of the world. Subsequently Mr. Cotsworth was invited to give an illustrated lecture on "Measures of Time" at a private meeting of the members of the Senate and House of Representatives.

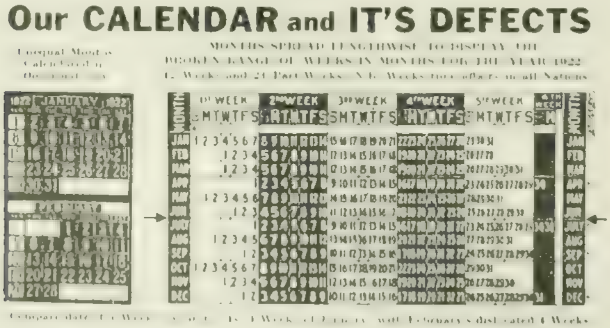

Fig. 1

With the support of such powerful agencies as have just been enumerated, and the fact that "The International Fixed Calendar" is already well known in Europe, it is altogether likely that the calendar will be reformed at an early date on Mr. Cotsworth's plan. Such briefly is the progress of the movement up to the present time.

The whole question is epitomized in Mr. Cotsworth's statement:— "We need a monthly measure in which the day names, with regard to the commercial dates, will be fixed". The truth of this assertion is clearly depicted in figure No. 1.

He further observes that our months vary from twenty-eight to thirty-one days, eleven per cent difference, yet the same monthly salaries, rents, etc., must be inequitably paid. Monthly business charges for maintenance, depreciation, etc., are unfairly apportioned, and monthly profits credited as though each month were productively one-twelveth of the year. Monthly trade balances, wage adjustments, etc., are complicated by weekly wages being split up in the weeks, which, beginning in any one month, quarter, semester or year, end in the next following. Nine of the months extend into five weeks and three into six, as a glance at the chart, (figure No. 1), will show.

Lack of space precludes a full explanation of the method of reform; but the following brief outline of Mr. Cotsworth's plan should suffice to familiarize the members of *The Institute* with it's main points.

(1) The length of day, weeks and years to remain unaltered, but the months to be made a uniform length of twenty-eight days in seven-day weeks, the amended year to consist of one day plus thirteen twenty-eight day months, making the present year length of three hundred and sixty-five days. He proposes to place the odd day at the beginning of the year and call it "New Year's Day, a universal holiday designated January 0. The business year would then commence on January first with the customary week-day names. He suggests numbering instead of naming the months, or if naming be preferred, introducing the new month "SOL" between June and July. Figure No. 2, illustrates the proposed standard month.

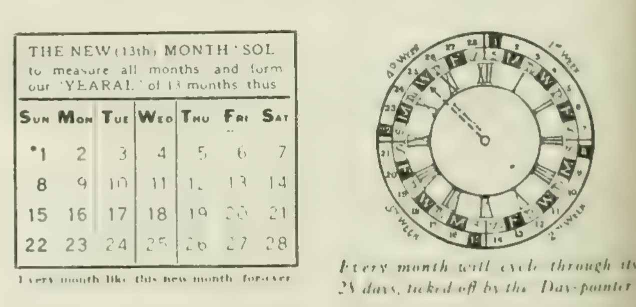

Fig. 2

(2) The extra day in leap years to be inserted as a midsumm holiday not called by any week-day name, and designated Sol 0, July 0.

(3) The date for Easter to be agreed upon by the internation churches, and permanently fixed.

(4) The date of commencement of the new calendar to be fixe by agreement.

(5) An international government conference of all nations to l assembled for the purpose of drafting joint legislation for ratificatio by each government.

In a recent article in the June number of the "Bulletin of tl Pan-American Union", Mr. Cotsworth concludes with the observati that "in addition to other benefits the reform will cause nine per ce more circulation of all monthly moneys now used for monthly accoun salaries, rents, etc., (without any increase in capital outlay), theret increasing business and social prosperity." This feature will undoub edly appeal to the engineering profession, as an economic advanta apart from other promised benefits of the proposed reform.

Yours very truly,

P. H. BUCHAN, A.M.E.I.C.,
Secretary Treasurer,
Vancouver Branch.

Preliminary Notice

of Applications for Admission and for Transfer

20th July, 1922

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in Aug., 1922.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option, Railway, Municipal, Hydraulic, Mechanical, Mining or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects, Geography, History (that of Canada in particular), Arithmetic, Geometry, Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits scientific acquirements ,or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BAILY—PAUL, of 208 Bernard St., Montreal, Que. Born at Namur, Belgium, July 23rd, 1890; Educ., C.E., L.Sc., Univ. of Ghent, Belgium, 1912; engr. Belgium Govt., one year; engr., Fabrique Nationale and Armes de Guerre, Herstal, Liege, Belgium, one year; engr., Aerators Limited of London, England, until 1915; asst. ch. engr., and naval architect, Canadian Vickers, Ltd., Montreal, 1915-20; designing engr., Belgo Canadian Pulp & Paper Co., Shawinigan Falls, one year; at present asst. City Engineer of Verdun, Que.

Extensions to the Hydro-Electric System of the City of Winnipeg.

Additional Units installed in the Point du Bois Plant, on Winnipeg River.

E. V. Caton, M.E.I.C.,

Chief Engineer, City of Winnipeg Light and Power Department.

Paper to be presented at the General Professional Meeting, Winnipeg, Man., September 5th, 1922.

The hydro-electric system of the city of Winnipeg has been fairly well described in the electrical press. A paper before the Canadian Society of Civil Engineers by W. G. Chace, M.E.I.C., in 1911, described in detail the original installation. One by Dr. Herdt before the same society in 1914 described subsequent extension to the system, and various articles in the Electrical News, Toronto; Engineering, London; etc., have appeared. The present paper is descriptive of the recent extension carried out in 1919 and 1920, but a brief review of the original work is necessary for the proper presenting of the subject.

Without going into details, the original installation, completed for operation in 1911, consisted of practically all the hydraulic work, (dams, forebay, etc.), for a final development of the site, including the construction of the whole of the up-stream wall of the power house, into which the wheel pits are built. Allowance was made for the ultimate installation of sixteen units. Seven wheel pits were completed with eight draft tubes and the power-house buildings to accommodate eight machines, the remaining nine pits being completed only sufficiently to act as a gravity dam across the forebay end, sufficient being done, however, to allow of the completion of the wheel pits and draft tubes without any coffer-dam work on the up-stream side.

Five machines, consisting of twin-runner horizontal turbines of 5,200 h.p., connected to 3,000-k.w., alternators, were installed, together with transformers and switching to control same. Subsequently the eighth wheel pit was completed and three additional units consisting of twin-runner horizontal turbines of 6,900 h.p., connected to 5,000-k.w., generators were installed and one 9,000-kv.a., 3-phase, transformer, thus completely filling the original power-house building. In 1916 it was decided to complete the remaining eight draft tubes, and in 1919 it was evident that the final completion of the power house would be necessary to accommodate the machinery required to take care of the growth of the load.

Building Extension

The extension to be described consisted of the completion of the eight wheel pits and the final addition

to the power house proper to accommodate eight additional generators and their necessary apparatus.

The general design of the building followed very closely that of the original work, with such alterations as experience had shown to be desirable. The difference consists chiefly of the extension of the whole power house in a down stream direction to allow of more room for switching and the building on at the extreme end of an unloading bay, large machine shop, oil room and office space. From the cross-section shown on figure No. 1, it will be noted that the power house may be divided into three bays, viz. — wheel pits, generator room, transformer and switch bay.

Machinery

The addition to the plant consisted of three horizontal, double-runner, water turbines. These machines were guaranteed to deliver 6,800 h.p., at 150 r.p.m., under a 46-foot head, and on test gave 7,800 h.p., on full gate, the corresponding specific speed being 110. No means were provided to actually measure the efficiency, but the guarantees were as follows: Full gate 80%; 0.85 gate 85.5%; 0.80 gate 85.0%; 0.70 gate 82.0%; 0.60 gate 80.0%. In view of the fact that the draft tube and wheel pits were identical to those designed for the 5,200-h.p., units, it would appear that these efficiencies must be closely approached. Figure No. 2 is of interest, showing the velocity of water through the draft tube for the original 5,200-h.p., unit and the new 7,800-h.p., units.

The machines are of the three bearing type, all bearings under water, including the thrust, are lignum-vitae. The water being exceptionally free from grit or sand these bearings have proved very satisfactory and have eliminated the grease cups and other apparatus necessary with the babbit type of bearings.

An interesting development in these machines is the installation of curved plates in the draft tube, immediately behind the runner discharge end, the idea apparently being to distribute the flow evenly through the entire runner. It is the intention at some future date to remove these plates and test the machines to see what their effect on the actual machine is.

The governing is of the oil operated servo motor type, and the following are extracts from the specification for same and are of interest in that no actual speed regulation was asked for but the time of operation of the governor pendulum and servo motor was specified.

> "The pendulum and valves shall be so designed and related that the servo motor pistons will commence movement with a variation of turbine speed of one-quarter of one per cent.
>
> The servo motor shall be designed for an oil pressure of 150 pounds per square inch and shall be capable of making its full stroke either way in not more than two and one-half seconds when connected to the turbine gates under normal head."

The reason for so specifying was due to actual tests on the eight existing machines, which had given considerable governor trouble before they were finally accepted from the makers. As an indication that this method of specifying the governors was correct for the case in point, no trouble whatever has been experienced in putting the new unit into commission and perfect parallel operation and speed regulation has been obtained. It is not suggested that this method of calling for governors is applicable to *all* cases or for individual machines, but where machines are already installed it gives the assurance that satisfactory governing will be obtained and also takes away from the governor manufacturer the uncertainty of figuring on hydraulic conditions of which he has no exact data.

Generators

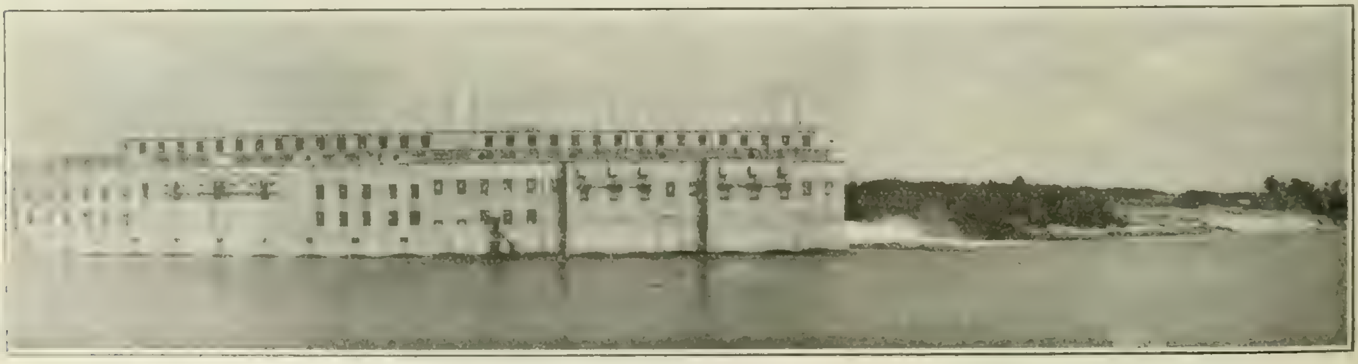
The generators are rated at 6,500 kv.a., maximum rating, are provided with temperature indicators in the winding, and have a fly wheel effect of 3,500,000 W.R.[2] Each machine is provided with its own direct connected exciters of 58 k.w., capacity at 125 volts. Air operated brakes were provided but owing to the excellent fitting of the gates the use of these has not been found necessary.

The old exciting system consisted of two 250-k.w., water-driven exciters, but as it was impossible to provide for water turbines for additional exciters it was decided to equip all of the existing machines with individual exciters, and the end of the main shafts were machined and drilled to take the half coupling flange of the exciter, the exciters being placed on concrete pedestals. The question of providing the additional exciter capacity by motor-driven exciters was considered, but the unsatisfactory operation of this class of apparatus under system trouble led to the individual system being finally decided upon.

The old exciters are being replaced by two 310-kv.a., 220-volt, alternators, which will supply power for the pumps, light and other station services.

Transformers

Three oil-insulated, water-cooled, transformers were installed, each being of 5,000 kv.a., capacity at 35°C rise, and having a continuous rating of 6,000 kv.a., at 50°C rise.



City of Winnipeg Hydro-Electric Power Plant.

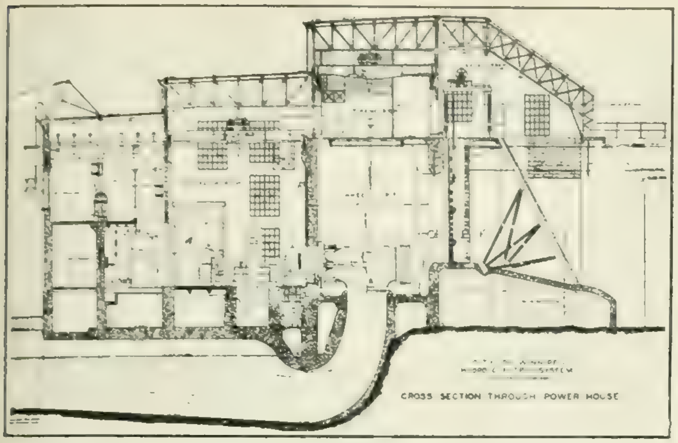


Figure No. 1. City of Winnipeg Hydro-Electric Plant, Power House Cross-Section.

Governor Oil System

As the eventual power-house will contain sixteen machines, it was considered that individual governor oil pumps on each machine would result in too high maintenance costs and excessive attention being required. To obviate this a central pumping system has been installed, consisting of three motor driven gear oil pumps, delivering oil at 200 pounds per square inch pressure to a common piping system, which will eventually run the entire length of the power house. This pipe line is in duplicate and the governor mechanism of each machine is connected to either of these pipes through valves and through an oil storage tank of sufficient capacity to allow of the gate operating several times without the pressure falling too low to operate. Pressure is maintained by air pressure supplied from a small motor driven air compressor.

The discharge from the servo motor is returned to the pump sump by a large cast iron header. The pumps run continuously, discharging into the oil sump through an unloader when the machines are not taking oil. The system is designed on the open system, ample ventilation of the oil tanks to a point above the power-house roof being provided. Arrangement is made in the piping to allow of the oil in the sump tanks being treated through a centrifugal oil separator while the pumps are in service. At present only the three new machines are connected to this system, but eventually all will be.

Head Gates

In the original plant each wheel pit had its own head gate, operated from a system of gears. In the new section the gate operating gear is mounted on a carriage similar to a stop log lifting device, running on rails over the various wheel pit openings, and is operated by a 15-h.p., d.c., motor, mounted on the carriage.

The gates are in three sections of structural steel and steel sheathed, wood labyrinth seals ensure a water-tight joint between the sections. All three sections are hung on to the carriage when not in use and can be swung by means of travelling blocks into position for lowering into the gate slots. In actual practice these gates have proved themselves to be everything that was expected.

Switch Gear

Due to the ultimate size of the plant, and the possibility of tying in with other plants at a later date, the switching and control gear was given very careful study. It was evident that the existing switching and bus work was inadequate for these conditions and it was decided to install complete new switching for the entire plant. This could be economically accomplished since the existing switching could all be used in the city extensions.

Figure No. 3 shows the existing and ultimate installation.

All 6,600-volt switches have now been placed in the extreme down-stream bay of the new extension. Complete duplicate bus-bar systems have been provided and the switches grouped in sets of five, i.e. — four machines and one transformer bank. The individual groups are placed at right angles to the length of the power house and the main bus run along the south wall. The switches are in concrete compartments, sub-compartments disconnecting switches are provided on the machine side of the switch, the disconnecting switches on the bus side being the wall mounting type. All disconnecting switches are provided with locks.

Special care was taken in the construction to allow for all mechanical and temperature stresses. All the supports are of the extra heavy type and they are arranged to be always in compression, the ultimate stress being taken up by the main structure. Due to the extreme

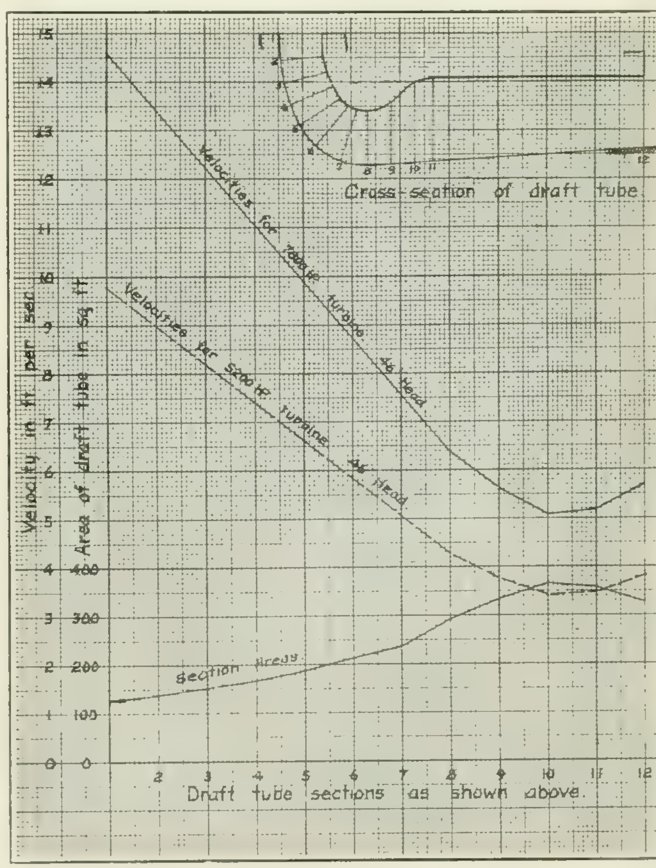

Figure No. 2. City of Winnipeg Hydro-Electric Plant. Velocities and Areas through Draft Tubes.

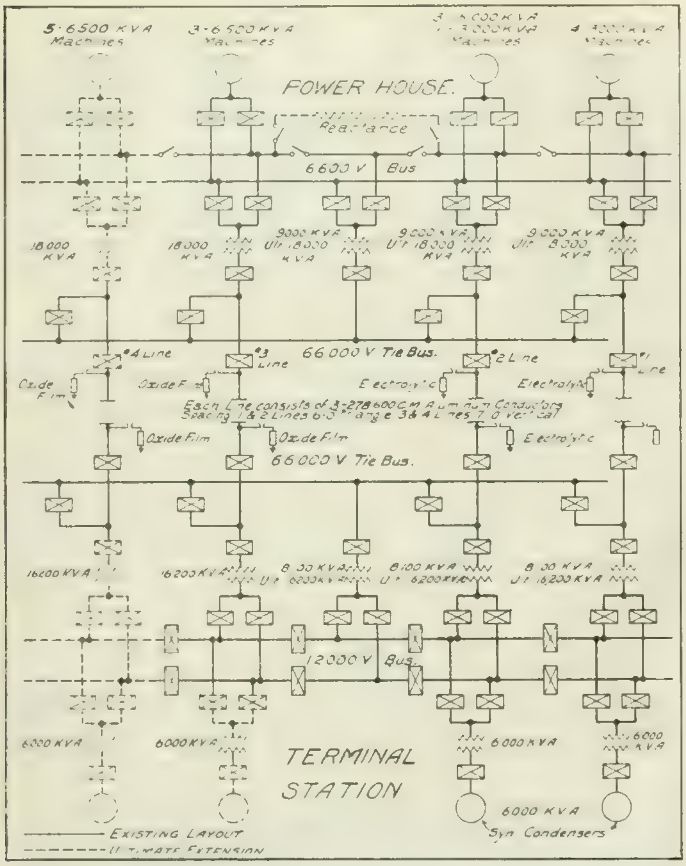

Figure No. 3. City of Winnipeg Hydro-Electric System. Line Diagram System.

temperature changes, special provision had to be made for the expansion, not only of the bus bars but also of the slab structure itself. This was accomplished on the south wall barrier by supporting the slabs on one end in the wall into which they were grouted, and on the other edge on a steel angle, which allowed the slabs to move in one direction. The bus clamps allow the bus to expand in the direction of their length but up-and-down motion is prevented. By anchoring at definite points, the expansion is controlled and no deflection of the bus can take place under the limits of temperature to be expected. Up to date no cracks or breakages have appeared on any of the structures.

All cables leading to the switch or from the machine are single conductor, cambric insulated, flame proof braided, carried on asbestos covered structural steel supports in the basement.

Special care was taken in the layout and design of the control wiring, it being the endeavour to allot a definite position for each control cable throughout its entire run and to minimize the usual control wiring complication as much as possible. This was done by the use of multi conductor, lead covered control cables, run in open steel trays. All individual wires are braided in different colours and a definite colour scheme has been maintained throughout the system. All control and instrument wires run through a terminal and test panel before going to the control and instrument board.

By keeping all relays, instruments, and recorders on their own sets of panels, a very accessible and open wiring scheme has resulted and any control cable may be easily located without interfering with any of the others, test instruments may be inserted into any circuit without disconnecting any leads, and any individual sections of the control wiring can be easily localized in the case of trouble.

The high tension line switches and oxide film arresters are placed on the floor immediately above the low tension switches. The high tension transformer bank switch and tie switches being placed above the transformer compartments. The relay protection provided is balanced relays on the generator, the star point being opened and current transformers inserted. The other transformers are immediately below the switches so that the relays protect not only the machines but also their cable systems. The same method is provided for the transformers, the current transformers for the high tension side being of the bushing type. Overload induction type relays are used on the high tension lines.

Transmission Line

Two new transmission circuits have been provided. The cables are 278,600 c.m., aluminum, carried on steel towers placed along the present right-of-way. The towers are of three types, four legged braced, flexible towers and lattice poles, spaced on 400-foot centres. Extra heavy towers are placed at all angles and dead ends. A $\frac{3}{8}$ steel ground wire is strung along the top of the towers. Pin type, 80,000-volt insulators, mounted on forged steel pins, are used, except at angles and dead ends where suspension type insulators are used.

In addition to sectionalizing switches placed at five points along the line, a switch tower at Tyndall, thirty-eight miles east of Winnipeg, allows of the cross connection of all five lines. When first put into operation it was found that owing to the close proximity of the new lines to the telephone line considerable interference was caused. Drainage coils, consisting of 15-k.w., standard pole type transformers with their 2,200-volt coils connected across the line and middle point grounded, were placed at each end and completely eliminated the trouble.

The additions in the city consisted of the installation of additional switching in the terminal station to handle the two new lines, and oxide film arresters on each line. Also an additional transformer bank of the same capacity as that installed in the power house. The general scheme of switching is similar to that at the power house, the low tension switching installed being the switches which had been discarded at the power house.

Principal Manufacturers and Machines Installed

Water Turbines: Boving Company of Canada. 7800-h.p., 150 r.p.m., 46-foot head.
Generators: Canadian General Electric Company. 6500-kv.a., 6600 — 7200 v., 3-phase, 60-cycle.
Transformers: Canadian Westinghouse Company. 5000-kv.a., at 35°C rise, 6600–66000 volts, S.P., O.I., W.C.
Canadian General Electric Company. 5000-kv.a , at 35°C rise, 66000–12000 volts, S.P., O.I., W.C.
Switching: Canadian General Electric Company. H-6, 6600 v.
Canadian Westinghouse Company. G-A, 70,000 v.
Lightning Arresters: Canadian General Electric Company, oxide film.
Transmission Towers: Canadian Bridge Company.
Transmission Cable: Northern Aluminum Company.
Insulators: Canadian Porcelain Company. No. 1810.

Improvements to Moncton Yard and Engine Facilities

Construction Methods employed to Minimize Interference with Traffic.

S. B. Wass, A.M.E.I.C.

Terminal Engineer, Canadian National Railways, Fort William, Ont.

Paper to be presented at the General Professional Meeting, Winnipeg, Man., September 7th, 1922.

The city of Moncton is situated on the Canadian Government Railways at the junction of the main line from Halifax to Montreal and the line from the city of St. John, and is also the eastern terminus of the Transcontinental Railway, which makes it the gathering point for traffic from the west to Halifax, Sydney and all points east of it, as well as the breaking-up point for traffic in the opposite direction. By reason of this fact it is the most important railway junction point in the Maritime Provinces, and requires adequate facilities for handling traffic rapidly and efficiently, and also for distributing empty cars and equipment of all descriptions to points where needed. For a number of years the yard has been too small to provide the necessary working capacity, and the tracks too short to accommodate the long trains hauled by the new large locomotives. The roundhouse and other facilities, which were old, were too small and without proper facilities for making the running repairs to the present-day large locomotives.

Layout of the Yard and its Approaches

As will be seen from figure No. 1, the old connection with the main line and transcontinental line, with the yard, is near the east end, and by means of a wye connection; the tracks parallel to the west leg of the wye being used for a freight receiving yard from, and those parallel to the east leg as a departure yard for, trains to the north. These tracks were too short to hold the long trains, which resulted in a great deal of terminal detention. All of the freight coming to and from these tracks had to be shunted across the St. John main line, which caused an excessive amount of shunting and congestion. To eliminate this condition, and so simplify yard movements, a diversion was constructed from mile 3.5 on the north main line to mile 2.5 on the St. John sub-division, thence parallel to the St. John sub-division to the yard. By this means all traffic enters the yard from the west, making a simple east and west yard, except for the transfer to the Moncton shops, which traffic, being only local, is small. A very complete ultimate layout has been designed which includes east and west receiving yards, classification yards, which may be equipped with humps if required, east and west departure yards, transfer and storage tracks, new car repair facilities, new engine facilities, etc., so located that the construction of any additions or extensions required to meet traffic conditions may be carried on without materially interfering with traffic. This yard is arranged in units so that it may be constructed and operated in sections as the traffic demands. The conception and design of this general layout originated with Collingwood B. Brown, M.E.I.C., recently chief engineer, Canadian Government Railways, and now engineering assistant, to the vice-president, Canadian National Railways, Toronto. All of the expenditures and construction up to date have been in accordance with this ultimate layout.

Construction Work

The actual work of construction was commenced in the season of 1919, and consisted of three parts:

(1) The acquiring of additional land which was required on both sides of the present yard to provide for present and future requirements, and to avoid farm crossings.

(2) The construction of the diversion from the main line to north, referred to above. The maximum grade used was 0.6 per cent, compensated for curvature, and involved the raising of the St. John sub-division, a height of 6.5 feet at the under crossing of the Salisbury road, mile 1.8, and extension of this bridge from a single

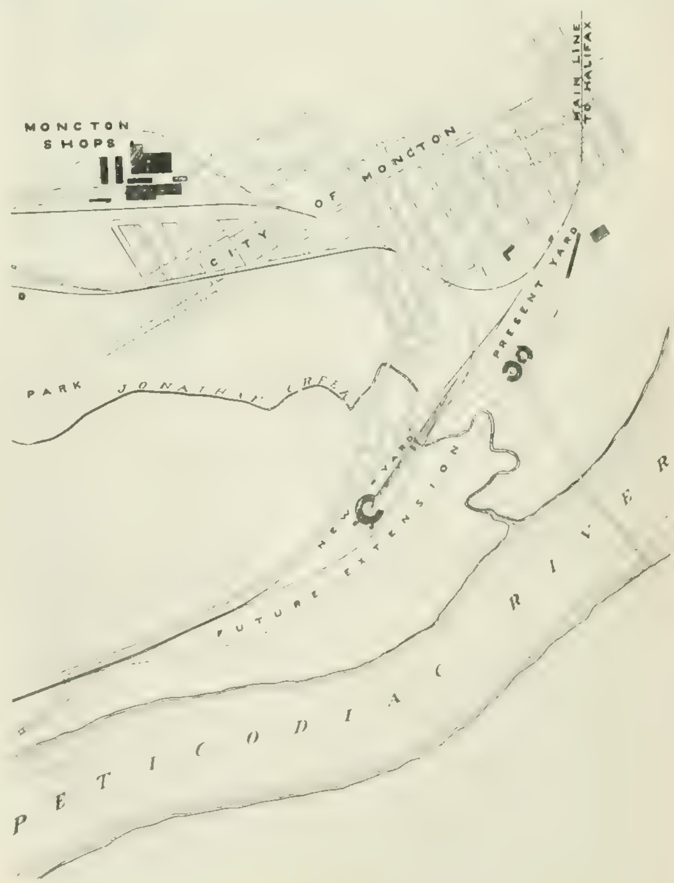

Figure No. 1. Plan of Moncton Yard Layout with Approaches

track to a three track structure. The contract for this work was awarded to the Dominion Construction Company Ltd., and Wheaton, late in the season of 1919, and the work was completed early in 1920. A considerable saving in operating expenses was effected during the first winter by the use of this diversion for freight movement, although the old line was continued for passenger traffic use.

(3) Construction of freight shed and freight transfer platforms. The old freight shed was very inadequate for the local and transfer traffic. A new shed with additional trackage, arranged to conform with the new layout, was constructed. The structure is 400 feet long by 40 feet wide, of brick and structural steel construction. The contract for this work was awarded to engineers and contractors of St. John, and the work was completed early in the season of 1920. A transfer platform 500 feet long was also constructed, conforming to the new layout.

Construction Work during 1920

The engine house, coaling plant, and other engine facilities, are located on the high ground, where foundation is good, just west of Johnathan creek, which crosses the yard at about mile 0.6 and flows across the marsh, the level of which is approximately 25 feet below the grade elevation. This marsh has an average width of about 400 feet, the Johnathan creek culvert being located at its extreme west side. The ground west of the culvert for a distance of 5,000 feet was generally above grade, ranging from zero to fifteen feet, which necessitated a considerable amount of excavation. The material was required partly to widen the embankments at the extreme west end of the yard, but mostly to make the embankment over the Johnathan creek marsh.

An extension of the Johnathan creek culvert under the old yard was also necessary. This culvert is a double six feet by six feet concrete rail top structure and the extension on its upper end is 312 feet long. The original stream crossed the marsh diagonally, necessitating a diversion to bring it to the inlet of the culvert. In order to have the site ready for buildings during the season of 1921, the construction of the culvert extension and grading for the site of the buildings was performed in 1920, so far as it could be done without interfering with the operation of the old yard. A contract for this work was awarded to the Dominion Construction Company Ltd., and Wheaton, and the work was completed by the end of 1920, about 95,000 cu. yds. of material having been excavated, and the culvert extension and stream diversion completed. One special feature of this work is worthy of mention, namely, the efficient method of handling the foundation excavation from the culvert and the excavation for the stream diversion. For this work a movable stiff-leg derrick on a base of heavy hard pine timber was constructed, and on it was mounted the hoisting engine, which served at once as a counter weight and supplied the power for operating the derrick for handling heavy materials, the orange-peel bucket for excavating, and was also used to propel the whole apparatus by means of deadmen. This machine was placed ahead of the work and rolled on a grillage of timber and rails which distributed the load over considerable area so that no difficulty was encountered supporting the machine, as is so frequently the case in handling movable derrick apparatus close to the edge of excavation.

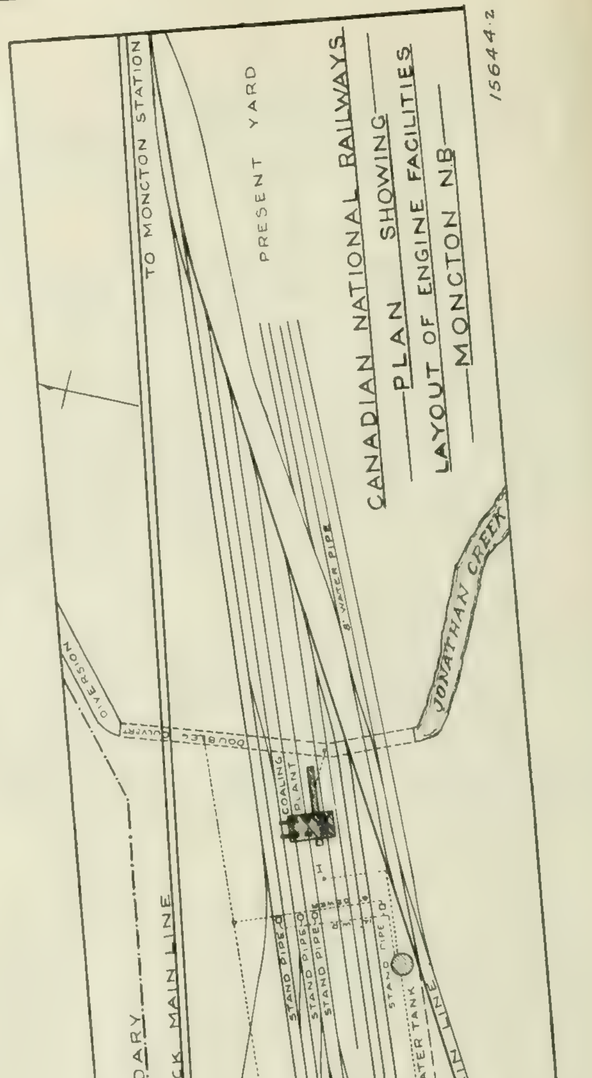

Figure No. 2. Plan of Moncton Engine Facilities.

Work during 1921

The work during 1921 consisted of continuing the grading, diverting the main line, and construction of buildings and service tracks as shown in figure No. 2. It will be seen that a locomotive approaching the facilities will, under ordinary conditions, obtain the necessary attention in the following order; coaling and sand, water, fire cleaning, housing. Three inbound and three outbound tracks have been provided, all of which are served by stand-pipes for water. Coaling facilities are provided on the three inbound tracks, and by means of cross-overs, locomotives on two of the outbound tracks may be coaled with very little interference with the inbound locomotives. Four tracks have been provided with ash-pits and sufficient cross-overs have been provided to facilitate any desired movement of the locomotives. Fifty tracks to the turntable have been provided for, four are running tracks to and from the turntable, forty are entrances from the turntable to the forty stall house, which is now constructed, and space for an additional six stall section when required. All buildings except the water tank and coaling plant are constructed of brick on concrete foundations with mill type frames of B.C. fir, except the machine shop which has a structural steel frame. This is one of the largest layouts for a single engine house in Canada.

As much of this work had to be performed in the present yard, without interference with traffic, it was decided to do it by the railway's own forces under the supervision of the chief engineer, A. F. Stewart, M.E.I.C., with the construction engineer, S. B. Wass, A.M.E.I.C., and assistant engineers, E. R. Evans, A.M.E.I.C., and H. L. Currie, A.M.E.I.C., directly in charge of the work.

When the work was approved very few detail drawings were prepared, and these were made as quickly as possible in the chief engineer's office by H. J. Crudge, A.M.E.I.C., assistant engineer of buildings, R. G. Gage, M.E.I.C., signal and electrical engineer, and C. S. G. Rogers, A.M.E.I.C., assistant engineer of bridges, for ash-pits, and steel water tank. The field work was divided into two units, each reporting to the construction engineer, and each consisting of assistant engineer and a small staff, with general foreman, and as many other foremen as necessary. One timekeeper and one materialman, with some temporary assistants were employed on the whole work. E. R. Evans was assistant engineer in charge of grading, etc., with T. McPherson as general foreman, and H. L. Currie was assistant engineer in charge of buildings, with D. A. Seaman as general foreman. G. N. Allen S.E.I.C., was timekeeper on the whole work. Special attention was given to the design and installation of the heating and piping systems by H. F. Finnemore, A.M.E.I.C., and to lighting by F. H. Williams, A.M.E.I.C., both assistants to Mr. Gage.

Several small contracts were awarded for special work as follows: Steel water tank, Dominion Bridge Company, Montreal; coaling plant machinery, Williams and Wilson, Montreal; tar and gravel roof, Carrite Company, St. John; plumbing, Johnston Bros., Moncton; oil storage system, B. F. Bowser Company, Toronto.

Grading

It will be seen, by reference to figure No. 2, that the main line of the St. John sub-division and the Reid's cut yard lies across the site of the proposed engine house, on a grade, and at a different elevation than that of the new work. It was therefore necessary to construct a new main line well in advance of building operations. Owing to the necessity of maintaining traffic, cutting both sides and under the main line, and to the irregular shape of the excavation required, ten cuts of the shovel were required; this with the shallow excavation, varying from two to fifteen feet, entailed a comparatively large amount of shifting of the shovel. The material encountered was heavy clay and hard pan. Some of it was used to widen the embankments at the west end of the yard, but most of it was deposited in the embankment over Johnathan creek marsh. The equipment used consisted of one model-60, Marion steam shovel, twenty-four Kilbourne and Jacobs, 16-yard air dump cars, one Jordon spreader, and two Consolidated locomotives.

In view of the shallow excavation and the settlement in the marsh, the shovel record would seem to be good. The shovel started work on April 11th and completed September 14th, having excavated 158,000 cubic yards, averaging 31,600 cubic yards per month, or 1,200 cubic yards per working day.

Sewer System

As the buildings were all located on the natural ground, composed of hard pan, very impervious to water, it was important that drainage be provided for the foundation excavations at the earliest possible moment, and the most effective method was to get the permanent sewerage system installed. This was entirely new and independent of all other sewers except for the coaling plant sewer, which, on account of its proximity to the culvert, has a separate connection with it. It discharges into the top of Johnathan creek culvert through a specially constructed manhole near its upper end.

The main sewer, extending from the outlet to the manhole opposite the ash-pits, is of twenty-four inch double strength, vitrified clay pipe 798 feet long, placed fourteen feet below grade so as to drain the ash-pits. From this main sewer, branches of smaller sized pipe are carried to the turntable pit, engine wheel drop pits, and all other facilities requiring drainage. The total amount of excavation for sewer trenches was 4,960 cubic yards in hard pan material merging into rock, so that hand labor was considered to be too slow. Several alternative methods were discussed and it was finally decided to try a Marion railroad ditcher which was available. This machine was supported over the top of the trench on old bridge stringers and in one operation excavated the trench in front of it and deposited the material behind itself, the pipe having been laid and jointed by men working directly underneath the machine. Some difficulty was encountered with a seam of quicksand about ten feet below the surface which caused the sides of the trench to cave in, but this was only for a short distance. The machine would dig only about ten feet below its support, so in order to excavate the bottom of the trench the machine had to make a surface cut, about four feet deep, wide enough to permit the timbers to rest on the bottom of it. So successfull was this method that frequently fifty-five lineal feet of completed sewer was laid in a working day, and an average of thirty-two lineal feet per day was maintained during the whole sewer

operation. The cost of trenching under the conditions encountered was easily less than half what it would have been by hand. The main sewer was commenced on April 28th and was carried almost to the turntable, so that all foundations could be readily drained by May 30th. The early completion of this sewer removed all necessity of pumping water from foundations.

Description of Buildings

The stall engine house contains forty stalls; thirty-three of which are 100 feet in length with 65-foot pits, and seven are 120 feet long with 80-foot pits. The house is divided into sections each of which is separated from the adjoining sections by fire-proof walls and doors. The sections are as follows: Commencing on the south-easterly corner, two sections of seven 100-foot stalls; one section of seven 120-foot stalls; one section of nine 100-foot stalls, and one section of ten 100-foot stalls. Three of the long stalls are provided with drop pits for driving wheels, and two with drop pits for tender wheels, so located that any pair of wheels on any of the railway's existing locomotives may be changed. The drop pits are all equipped with Taylor-Arnold pneumatic jacks. Each stall is provided with steam blower, with Barco connection, blow-off pipe. wash-out and boiler filling pipe, cold water connection, compressed air, all of which systems are connected with the power house, where the various pumps, hot-well, etc., are located.

The machine shop which is 84 feet long by 53 feet wide and is located at the back of the long stall section of the roundhouse and connected to it by a passage-way is provided with machines for light repairs, tool room and forge with jib cranes for handling heavy parts, and a narrow gauge push-car track between the machine shop and the roundhouse stalls.

The stores and office building is 100 feet long by 30 feet wide. The foreman's office is in the west end of the building, and adjoining it are the booking and registering room, locker room, wash room, shower bath, etc., The oil cellar, fully equipped with storage tanks, and ten self-measuring and registering oil pumps, is in the central portion of the building. The eastern end of the building to be used for miscellaneous supplies, is fitted with racks and shelves, and surrounded with an eight-foot platform with ramps. This building is heated by low pressure steam, supplied by the power house boilers.

The power house is attached to the back of the twelfth stall of the engine house and is eighty-seven feet by forty-four feet. It is divided into two parts by a brick wall, the back part of which contains two 250-h.p., Babcock and Wilcox water-tube boilers, which were in use in the old power house, but have been re-tubed, thoroughly cleaned, and repaired. The other part contains the air compressor, feed-water, wash-out and vacuum pumps, and steam driven fan and heater coils. A hot-well is located just outside the power house for storage of hot water. This hot water is used for feed water, refilling locomotive boilers, thus affecting a great saving in fuel.

The electric current is obtained from the railway's own system developed at the Moncton shops. It is used for operating the coaling plant and motors in the machine shop, in addition to a complete lighting system throughout. The lights in the engine house are so arranged with reflectors on the posts that an abundance of light may be obtained for work on any part of the engine, but economy may be effected by turning off those not required, as each stall is supplied with separate switches.

A mechanical coaling plant of 350-ton storage capacity, equipped to elevate coal at the rate of fifty tons per hour, was installed. It is provided with three coaling tracks, and one hopper track for receiving coal. It is operated by electric power from the railway system. The machinery was supplied and installed by Williams and Wilson Limited, of Montreal, under contract, but the construction of the building and all other work was done by the railway forces. Facilities are also provided for sand storage and supplying sand to locomotives at this plant.

Water is obtained from the city water-supply and a connection with the present nine-inch main just opposite the passenger car power house, and an eight-inch cast iron pipe, 3,343 feet long, was carried to the new facilities. A steel tank of 150,000-gallon capacity is provided as a storage reservoir. Four ten-inch standpipes are provided for watering locomotives, also connection to all buildings and facilities. The steel water tank was supplied and erected, by the Dominion Bridge Company, under contract, on a concrete foundation constructed by the railway forces.

Two double track ash-pits, forty feet long, were provided. These pits are twelve feet deep and so arranged that they may be operated as dry or flooded pits. They are constructed of reinforced concrete walls, lined with fire brick, with the sloping wall of steel rails under the tracks. The space between the two tracks, over the deep part of the pit, is covered with a wooden platform which is removed when the cinders are being taken out of the pits. The ashes are removed from the pits by a coaling crane with a clam-shell bucket. This crane is also used to load coal from storage piles or coal engines in case the plant breaks down.

Construction of Buildings

As all the buildings were required for operation at the same time, it was decided to carry on the construction of them simultaneously and thus prevent the work from becoming congested. For purposes of organizing a construction force, a fairly close estimate of the quantity of each class of work to be performed was made and from it an approximate estimate of the number of men and time required to perform each was obtained. By keeping in view the natural sequence of the work, a program was worked out by which the foundation work was kept well ahead of the concrete work, the concrete work ahead of the brick work, the brick work ahead of the carpentry painting, piping, etc., and throughout the whole work there was very little interference of one class of work with another, so that a gang once organized to perform certain classes of work was kept up to full strength until the work was practically finished.

Bills of material were also prepared, orders were placed for these as early as possible and arrangements made for delivery in accordance with the general programme of the work. By keeping daily records of material on hand, and by keeping the persons supplying the material

daily advised of the material situation at the work, no serious delay was caused for material, although in some cases the men had to be shifted to another part of the work for a few days. This was true in the case of the steel window lintels, reinforcing for the concrete floor in stores building, pipe fittings and electrical supplies. Notwithstanding this the general programme of the work was very closely adhered to.

Foundation Excavation

The material encountered in the foundations was all a stiff clay or hard pan, merging into rock, which made hand excavation very slow and expensive. As the site had been levelled to sub-grade the previous year, practically all the material from the excavation had to be hauled to the embankments as it was not suitable for filling near the surface, which made it very important that some mechanical means be obtained for loading it, especially where the quantities were large.

The back wall of the engine house and hot-air duct required a trench about eight feet wide and four feet deep, and contained about 1,600 cubic yards, nearly all of which was excavated and loaded on dump cars by the railroad ditcher, which was supported over the top of the trench by the same bridge stringers used on the sewers. The turntable-pit contained 1,950 cubic yards and was all excavated by the ditcher except the footings, which were cast out by hand, sufficient material having been taken out to permit this.

The excavation for the pits and pedestals in the engine house presented a difficult problem as these covered a large shallow area. An effort was made to excavate this with an orange-peel bucket, operated by the locomotive crane, but this was not successful the material being too hard. Finally the ditcher was used, but had the disadvantage of excavating a larger area than was required for the actual footings. A considerable amount of track shifting and shunting was entailed, but it worked out to be the most economical method available.

About seventy-five per cent of the excavation for the deep ash-pits was performed by the ditcher, the lower part of it was handled twice, the ditcher not being high enough to load the material into cars when lowered into the excavation to reach the bottom.

The foundation excavation for machine shop, power house, tank, and stores building, was all done by hand as the material, especially in the case of the latter, was required for backfilling in and around the building. The excavation for the coaling plant was partly done by teams with scrapers, partly by hand, and partly by the orange-peel bucket operated by the locomotive crane.

Concrete Work

The total quantity of concrete is about 5,300 cubic yards. Several methods of mixing and distributing this were considered, but as the concrete was practically all to be placed below rail elevation, and was distributed over a comparatively large area, it was decided to use small mixers, set up at convenient points close to the work, and so avoid transporting the concrete long distances. Two concrete gangs, consisting of foreman, mixer runner, and twelve to sixteen laborers, were organized, using two London gasoline mixers of six cubic feet capacity. The aggregate was all supplied on cars, and consisted of screened, washed gravel. The fine aggregate was from one-quarter inch down, the coarse aggregate was from one-quarter inch to two and one-half inches in size. For all foundations, piers and engine-pits, the concrete was proportioned: one part Portland cement, two and one-half parts fine aggregate, to five parts coarse aggregate. For the thin reinforced concrete walls of the main heating duct, the floor over the stores oil cellar, concrete window sills and lintels, a mixture of 1:2:4 was used. To waterproof the hot-well walls and floors, hydrated lime was added to the mixture, eight per cent of the weight being used. The material was put into the mixer dry, along with the other aggregates.

The site was such that the cars could be spotted close to the mixers, and the material, including the cement, wheeled directly from car to mixer, with one handling only. This effected a great saving in the cost of labor. The mixture was wheeled from mixer to forms with St. Clair carts of six cubic feet capacity, which were carried on plank runways at the elevation of the top of the forms. It was found that the London mixers were too small and a Smith one-half-yard steam mixer was substituted for one of them as soon as the heavier part of the concrete work, such as engine-pits, turntable-pits, etc., were reached. The small mixer did very efficient work on the outlaying buildings, but our experience was that the Smith mixer was the more efficient where the large quantity of concrete was required. The forms were made of two-inch dressed spruce in sections, so that they were used over and over again. In constructing the backwall and hot air duct about 300 lineal feet of sectional forms were built, and by taking these down and moving them ahead, the whole duct, over 1200 feet long, was constructed with the same set of forms. The same method was also used with pedestal forms, engine pit forms, etc. After removing the form it was cleaned and oiled before being used again.

The first concrete was poured on May 12th and by November 15th, the whole 5,300 cubic yards had been placed with the exception of a few odd jobs which were delayed waiting for material or other similar cause. In addition to pouring concrete, these gangs were used, especially that with the small mixer, in excavating foundations by hand, or other necessary work.

Brick Work

The brick work was commenced on May 26th as soon as the concrete foundation was ready to receive the same. At first a small force was employed, as the walls could not be carried above the top of the windows until the steel window lintels were received, which was on July 5th. After that the force was increased to twenty-six bricklayers, and maintained at that until the walls were up, on October 20th. Approximately 1,190,000 brick were laid, of which 400,000 were second hand brick from North Street station, Halifax. The remainder were new brick from Pugwash. Cement mortar consisting of three bags of cement, one bag (50 lbs.) of hydrated lime, with three-eighth cubic yard of Shediac sand, was used. For the first month this was mixed by hand, but after that a gasolene London concrete mixer was used. This worked out very satisfactorily, as the mortar was much more

uniform and was received by the bricklayers much fresher. Five men with the mixer had no difficulty in supplying mortar to twenty-six bricklayers, where twelve or more men had been required before.

Frame and Roof

The frame of all buildings, except the machine shop, were of British Columbia fir, most of which was received in April, and framing was proceeded with at once. Templates were made for each member of the engine-house frame, and resulted in saving a great deal of time, and in getting very uniform work and a good fitting frame. The frame for the coaling plant was also framed early, and erection commenced July 18th, as soon as the foundation was ready. For erection a 15-ton locomotive crane with 35-foot boom was used, and was a very great labor saver. This crane was used in erecting the second storey of the coaling plant, above which it would not reach, and the timber was erected by gin pole. The frame for three stalls could be erected from one track, and a foreman with eight men and the crane frequently did this in one day. After the frame was erected the crane also hoisted most of the sheathing to the roof, which was unloaded from the cars on the ground in sling loads, where it could be picked up by the crane.

The work of erecting, fixing joints, and bracing, went on almost continuously and was followed very closely by a gang of carpenters placing sheathing, smoke jacks, cornice and gutters; so that the roofing contractor, who came on the roof as soon as the first two sections were passed, worked continuously to the end of the work without delay. Erection of the frame was commenced on August 10th, and the crane finished hoisting roof sheathing on September 29th, having erected frame and roof material on the 40-stall engine house 89,500 square feet in area, during that time.

Heating and Piping

The foundations for boilers, air compressor and heating fans were poured at the same time as the foundations for the power house. The vitrified clay pipes connecting the hot air duct with the engine pits, were started just after the pouring of the pits, and followed around simultaneously with them.

Much of the equipment from the old power house including the two 250-horse power Babcock and Wilcox boilers, air compressor, piping, etc., was to be used in the new. As it was not possible to ascertain just how much of this equipment could be used again, and what repairs it would require, until it was taken down, this part of the work was commenced about July 15th. It was found that all tubes in the boilers required renewing, and that extensive repairs were necessary to the air compressor, and other equipment. The piping in the engine house was commenced as soon as the roof sheathing was well under way, and was continued around the building simultaneously with it. Considerable delay was experienced in obtaining some extra heavy special fittings for the steam and heating plant, but notwithstanding this the whole heating plant, air and water systems, were put in operation prior to the house being opened for operation. A total of 11,600 lineal feet of piping having been installed in the buildings.

Permanent Tracks

During the season 7.03 miles of permanent track with 43 switches were laid. This work could not be done continuously but the layout was located on the ground, and wherever possible service tracks were laid in the position of permanent ones. A large amount of old track had to be taken up and shifted, and the locomotive crane was very useful in handling this material.

Transferring from Old to New Facilities

It was necessary to continue operation at the old facilities until the new ones could be used. About one-half of the machines in the old shop were belt driven, and these were installed in the new shop, while the motor driven machines were left in the old shop until after the transfer had been made.

The transfer of the turntable naturally was the governing feature, this was accomplished without any interference with traffic. The table was put out of service at the old house at 8.00 a.m. December 17th, and was raised out of the pit without removing deck or rails, by a 75-ton wrecking crane, by a rather unique method. The crane lifted one end of the table, blocking was placed under the centre, the table was then tilted over the blocking and the opposite end blocked up. By repeating this several times the table was raised high enough to permit car trucks with especially constructed bolsters to be pushed under the table. By this means the table was transferred to the new site by 4.00 p.m., where it remained till the following morning. During the night the crane was taken away on other service, and it returned at 11.00 a.m. By reversing the tilting process the table was lowered into the new pit, and at 4.30 p.m. December 18th the first engine went into the new house.

The total quantity of various kinds of work performed is as follows:—

Excavation by steam shovel	158,000 cu.yds.
Trenching for sewers	4,960 cu.yds.
Trenching for water pipes	3,690 cu.yds.
Foundation excavation for buildings, ashpits, tank, etc.	12,670 cu.yds.
Concrete poured	5,315 cu.yds.
Brick laid	1,190,400 bricks
British Columbia timber	392,000 ft. B.M.
Other timber and lumber	1,025,000 ft. B.M.
Steel water tank	150,000 gallons
Structural steel	57 tons
Reinforcing rods	31 tons
Reinforcing rails	13 tons
Sewer pipes	3,683 feet
Cast iron water pipes	5,460 feet
Hot air pipes	2,350 feet
Wrought iron piping	11,600 feet
Stand pipes	4
Fire hydrants	5
Permanent tracks	7.03 miles
Permanent switches	43
Ballast and cinders	40,000 cu.yds.
Roof area	1,073 squares
Glass area (Approx. 10,000 lights)	8,300 sq. feet.

Automatic Box Car Unloaders For Grain

A description of the Unloaders installed at the Grain Elevator Plant of Canadian National Railways at Port Arthur, Canada.

F. Newell, A.M.E.I.C.,

Mechanical Engineer, Dominion Bridge Company, Ltd., Montreal.

Paper to be presented at the General Professional Meeting, Winnipeg, Man., September 7th, 1922.

The necessity of having some form of automatic unloader for box cars conveying grain has evidently been under consideration from time to time for the past twenty years. This is shown by patents taken out but never developed into a complete machine which would meet all the requirements of both the railroad and the grain trade and at the same time do the work thoroughly and economically.

Before considering the design and requirements of an unloader, it is necessary to briefly visualize the transportation of the grain from farm to milling point, or in the case of export to some ocean port. In Canada, when we think of the many million bushels of grain produced in the Great West to be transported across the country and stored in grain elevators until required for consumption, the tremendous investments in rolling stock, terminal facilities, and grain elevators, and the important place which this problem has in the life of the people, it is easy to realize its national importance.

The grain is taken in trucks or wagons to the nearest country elevator where it is loaded into a box car, fitted with inside grain doors, and from there moved by rail to a terminal elevator where it is unloaded and the grain cleaned, sorted, and stored until ordered forward to a further point. Export grain may require to be handled through several elevators on account of being moved forward by both rail and water. The necessity of handling large quantities of grain in comparatively short intervals of time has brought about a very complete study of the methods employed inside a modern elevator, with the result that all manual labour has been eliminated, and the means of handling the grain have become automatic, and wherever possible, of the gravity type.

While handling methods inside the elevator have become very efficient, the unloading from box cars has, until the last few years, received very little attention, and the old manual methods of twenty years ago are still employed. Nearly all of this work having been done by means of a manually operated "Clark" power shovel. These shovels, generally operated in pairs, require two and sometimes three operators per car. The men employed on the work do so under very unhealthy and trying conditions. The physical exertion required is of a heavy nature, and the men are constantly enveloped in a dense cloud of grain dust. Their employment is by no means constant, and a good deal of the labour troubles experienced around the elevators is that caused by the shovellers. The earning power of the whole elevator is, therefore, dependent on the man power available for this work during rush periods, and also on their being continuously at work during the time that grain is being received.

A due consideration of the above conditions compared with the conditions one would like to see in general practice in this portion of the grain handling problem has led to the study of the possibility of using some type of mechanical and automatic car unloader, preferably of the gravity type.

Unloading Requirements

The following are the requirements of a successful box car unloader for grain:

(1) It must not damage the railway rolling stock, no matter how defective the condition of such rolling stock on arrival at the elevator.

(2) It must be designed to handle all types of box cars that may be received at the elevator.

(3) It must remove all grain from the car to the elevator pit without loss of grain and without hand labour.

(4) It should have means of removing the grain door quickly and without damaging same.

(5) It must be made practically foolproof in operation, and safe and reliable under all conditions of operation.

(6) It must have speed and economy of operation such as will more than justify its first cost.

(7) It must be served by trackage that will permit rapid handling of cars to and from the unloader without interruption to the unloading process over long periods.

Before considering the various types, let us picture a standard box car of grain with the usual side door and inside grain door which is usually nailed in, unless patent grain doors are used. In order to get the grain out of this car, the grain door has to be forced open, and if gravity is to be used, the car must be tilted either endways, or sideways, or both. Therefore, as tilting operations must be performed to empty the car, the most ready way is to run the car on to some form of rocking table or cradle, provided with end bumpers to keep the car from rolling off, and also with some form of mechanical door opener which will open and carry the door clear of the flow of grain. If we consider the shape of a box car with its long length comparative to its width, and with the door in the middle of its length, it will be seen that either or both side and end tilt would have to be made a good many times to empty the car of all grain, and consequently the cradle should be supplied with deflecting baffles which can be inserted in the car and avoid the side tilting operation, and also avoid an unnecessary number of end tilts.

Types of Unloaders

The various types which were under consideration before designing those in operation at Port Arthur were as follows: Trunnion live roller; knife edge suspension; rope suspension and rolling type. The relative advantages and disadvantages of side tilting, superelevation of the outer rail and the use of deflecting baffles without side tilt to the car, were also considered.

The trunnion and knife edge suspension types are comparatively cheap in construction as far as first costs are concerned, but would be liable to break down from wear and would be difficult to repair in case of such failure. The lubrication of heavily loaded trunnions presents some difficulty, and the maintenance of lubrication during periods of rest also entails a large degree of uncertainty. Further, if the point of suspension is kept below the base of rail, in order to keep the supporting bracket clear of the flow of grain, the out-of-balance moment when tipping to an angle of 45° causes a very heavy peak torque on the operating mechanism, and a correspondingly large motor is required. On the other hand, if the point of suspension is placed above the base of rail in order to reduce the out-of-balance moment, then the supporting bracket will interfere with the flow of grain, unless special rotating hoppers are introduced, these in turn providing additional complication.

A high virtual axis of rotation can be obtained by using a live roller support and a curved track; this, however, introduces a complicated track support, together with all the disadvantages attendant on live rollers, and a complex number of parts. Also, the axis of rotation would remain fixed and a good distribution of grain in the receiving hopper would not be obtained.

By side tilting the cradles or with a superelevation of the outer rail, it might be possible to do away with the deflecting baffles. This, however, causes very serious side stresses in the cars, for which they are not originally designed, and it is doubtful if sufficient side tilt could be given to the car to obviate the necessity of hand sweeping to thoroughly clean the car after operations were completed on the unloader. By inserting deflecting baffles, an angle of slope of 30° is made by the trough formed between the baffle and the floor of the car, when the car is tipped to 45° and the baffle inserted at 45° to the longitudinal axis of the car. Whereas in the case of a 15° side tilt the maximum angle of slope is only increased about 5° and along a plane of about 33° to the longitudinal axis of the car. The grain under these conditions being more likely to run down to the other end of the car than to flow out of the side door, as is required, with a minimum number of end tipping operations. The clearance required for side tilts also makes a wider spacing of trackage and housing necessary, and a consequent increased cost in construction.

Type Adopted for Port Arthur

The unloader adopted is of the rolling type, operated without side tilt but with deflecting baffles and an automatic door opener, which opens the grain door without damage and carries it clear of the outward flow of grain from the car. The rolling type was used because it is possible to obtain a higher virtual axis of rotation than with the trunnion type, and has not the possibility of breakdown and consequent delay which might occur with the use of live rollers or knife edge suspension. The higher virtual axis of rotation allows the unloader, whether empty or loaded with a full car of grain, to be in stable equilibrium. The point of support moving in a horizontal plane in the direction of rotation causes a less out-of-balance moment with a loaded car and a better distribution of grain in the receiving hopper than would obtain with the trunnion type.

The prime function of an unloader is its ability to efficiently handle all sizes of box cars in existence, or contemplated in the near future, which might be used at any time for the transportation of grain, and, in the design of the unloaders at Port Arthur, due consideration was given to the following: (a) Weight of all box cars and contents; (b) variation of length, width, and height of all box cars; (c) variation in elevation of floor of box cars, both when loaded and unloaded; (d) variation in width and height of grain doors.

The result of a thorough consideration of all these points is that the unloaders have been built to cover all possible variations in the above mentioned features of box cars, with the possible exception of a few freak cars.

General Description

The unloaders consist of a heavy structural rocking cradle, capable of being tipped with its longitudinal axis at a maximum elevation of 45° to the horizontal in either direction. This cradle carries the car of grain, and is provided with end locks to definitely support the end of the cradle while cars are being taken on and off, and with collapsible end bumpers to bring the car to a central position on the cradle, clamp the car in this position and take the total end thrust on the couplings of the car during the time the car is tilted at any angle to the horizontal in either direction. One side of the cradle is provided with heavy structural steel brackets which carry the door opening mechanism, two deflecting baffles, and baffle operating mechanism. Between these brackets and opposite to the grain door is a deflecting hopper or chute to insure the grain being carried well into the centre o

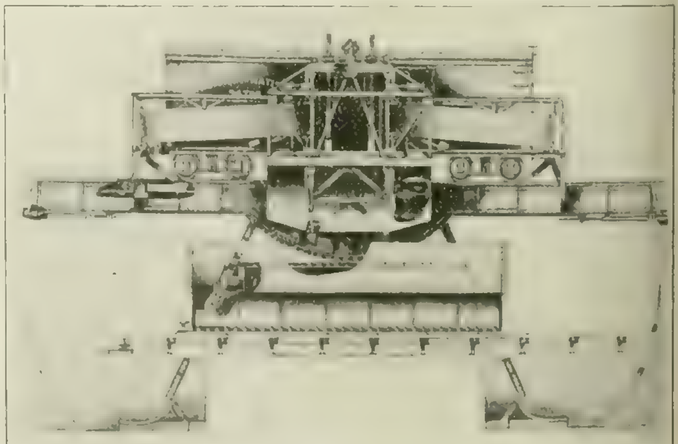

Figure No. 1. Automatic Unloader for Grain Cars.

the receiving hopper. Steel gratings are provided to protect the chute and to cover all the open spaces around the unloader. Flexible deflectors are also provided to prevent any spillage of grain along the side of the walls of the car, or in any manner except into the receiving hopper. A closed operating cab from which all movements of the unloader are controlled is placed in a fixed position opposite the grain door, and at an elevation from which all movements of the grain can be observed.

Cradle

The cradle consists of two heavily built web plate girders, having the lower portion at the centre formed into a circular tread which rests on steel cast tracks supported on a heavy concrete foundation. These girders are rigidly braced in a horizontal plane, and also at right angles to the axis to prevent side flexure, and to make the girders act together as a whole rigid tilting platform. The girders are designed to take a maximum loaded box car estimated to weigh 180,000 pounds, that is 60,000 pounds for the car, and 120,000 pounds for the grain; the girders being able to take this load with the horizontal axis tipped to 45° from the horizontal in either direction. The girders are also designed to take a 380,000 pounds locomotive when in the horizontal position and with the end pins in place. The circular tread at the bottom of the girder is made from heavy steel castings of a depth necessary to transmit the re-action over a sufficient length of web and also to take the load from the radial stiffeners down into the fixed tread. Heavy rolled plates were at one time considered for the circular tread, but were discarded on account of the possibility of a creeping action and consequent shearing of rivets due to constant reversal of rolling, as when using a thin plate the heavy concentrated load is liable to put a buckle into the plates between rivets, and during the tilting operation this buckle would be rolled forward across the plane of each pair of rivets holding the tread to the flange angles, and would in time cause the rivets to shear; the action taking place on each pair of rivets as the load passes over them, and being increased in effect due to the reversal which takes place in tilting in the opposite direction.

The fixed roller treads were designed with projecting lugs which roughly fit into corresponding holes in the rolling tread, these lugs being used to prevent the possibility of any slip between the cradle and the fixed tread during the tipping operation.

Tipping Machinery

The tipping machinery consists of a 75-h.p., wound rotor motor, equipped with a full torque solenoid brake, driving the main operating pinions through a worm and worm wheel, equalizing gear and bevel gears. Two pin-connected struts are fastened to the cradle, each having, respectively a rotating axis at a point beyond each end of the circular tread. These struts are equipped with cast steel racks engaging the main operating pinions. When tipping the cradle, the racks are subjected to a constantly changing velocity due to the variable point of rotation caused by the rolling action of the cradle on the fixed tread. The variable velocity of the racks, one with the other, necessitates the introduction of equalizing gears. These are of the spur pinion type, designed with three points of application equally balancing the load about the axis of the shaft, to prevent undue bending on the main cross shaft. The equalizing gear and worm gear are enclosed in an oil-tight case in order to obtain a high efficiency; the thrust from the worm being taken by ball thrust bearings. The efficiency of this mechanism is such that it is possible under load to drive the worm by pressure applied to the worm wheel teeth. The racks and struts are provided at the outer end with guides when in the lowered position, as at this time the yoke or carriage maintaining alignment between the pinion and the rack are at the upper end of the strut close to the connecting pins. The ends of the cradle are also guided by rollers at each end to assure an alignment of the track rails after tipping operations are completed.

End Locks

Four end locks are provided, each consisting of heavy steel pins, one at each corner of the cradle. The pins are pointed at the ends for easy entrance into the castings bedded in the concrete abutments, and are operated by a 5-h.p. motor through a screw and spur gear. They are designed to take the weight of a loaded car or engine coming on or off the cradle and give a final alignment to the rail in both the horizontal and vertical direction. They are interlocked with the bumpers or car clamps so that they cannot be withdrawn until the car is centralized on the cradle, and in the reverse, the bumpers cannot be lowered until the end locks are driven home; thus preventing any accident due to the possibility of running a car or engine on or off the unloaders, excepting when the cradle is supported at the ends by the four interlocking pins.

Bumpers or Car Clamps

The bumpers or car clamps are arranged so that the car does not have to be spotted in an exactly central position on the unloader, but can be pulled on the unloader into any position within two or three feet, and will be pushed into a central position by the bumpers. They are also designed so that practically any length of box car can be clamped in a central position on the cradle.

The clamps or bumpers at each end consist of two steel cast slides connected to a pair of tension and compression links capable of rising to the level of the car coupler and then travelling forward, forcing the car to a central position when the bumper at the other end will strike the coupler and clamp the car. The front slide, that is, the one nearest the transverse centre line of the unloader, is fastened to a wire rope coiled upon a drum, which is in turn clamped with a retarding torque sufficient to hold the slide in a fixed position. The rear slide, which is definitely operated by a screw, is, at the same time, lifting the tension and compression links to the required height. When this has occurred, the two slides come together and travel forward until the car is clamped at both ends. The slides are operated simultaneously at both ends by a single 10-h.p. motor operating the screws and travelling nuts through a pair of spur gears.

On account of the variable length of cars, the length of travel is *not* controlled by limit switches, but a slip

clutch is provided between the motor and gearing so that the motor can run after the mechanism has been stalled by the bumpers clamping the car at both ends; the clutch being supplied with a positive drive in the reverse direction to overcome the static friction of the mechanism when operating in the opening direction. The question of placing limit switches in parallel on the contact between bumper and coupler was at one time considered, but not installed due to the variable time element which would occur, in the operation of the switch, inertia of the rotor and application of the solenoid brake.

In applying the clamping device, as described above, to the couplers of the car, the component of the weight of the car and grain along the rails is taken on the coupler, which is designed for such loads. The bumpers were designed for a maximum load of 127,500 pounds and work very efficiently, allowing practically no end play when rocking the car.

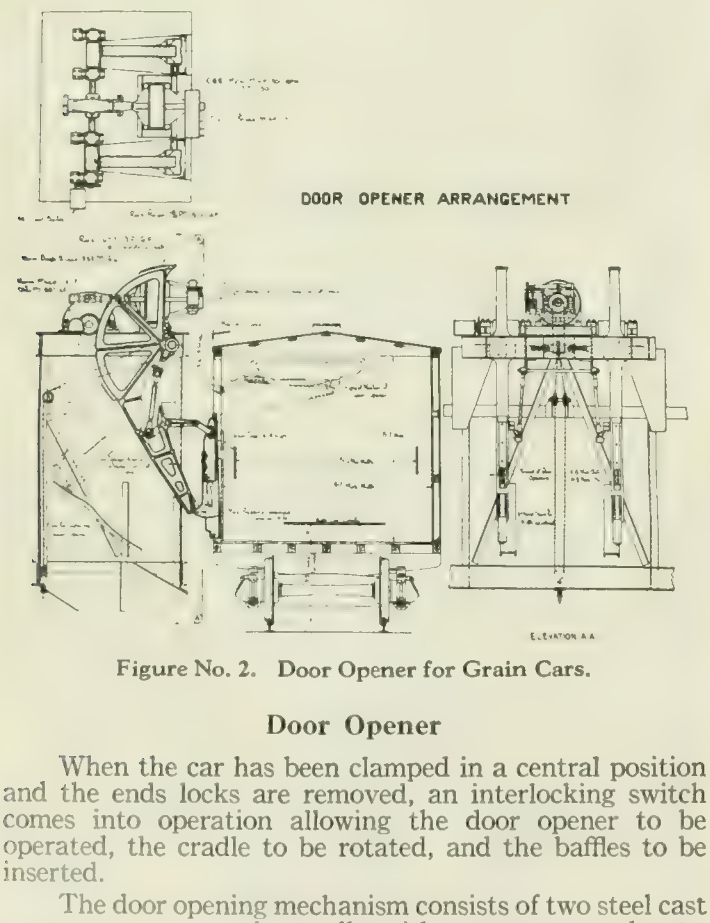

Figure No. 2. Door Opener for Grain Cars.

Door Opener

When the car has been clamped in a central position and the ends locks are removed, an interlocking switch comes into operation allowing the door opener to be operated, the cradle to be rotated, and the baffles to be inserted.

The door opening mechanism consists of two steel cast pressure arms, cast integrally with spur gear quadrants, pivotally mounted on trunnions and rotated by spur pinions from a common shaft driven through worm gearing by a 22-h.p. motor. Means are provided for adjusting the width of the pressure arms to suit the varying width of door openings and are arranged so as to strike the door as close to the door posts as possible. When the pressure arms first touch the door, their lower ends are kept above the elevation of the highest car floor and are so arranged that a slight pressure on the door releases a telescopic arrangement at the bottom of the arms allowing an extension to come down until it strikes the door sill. By this means the pressure is exerted over the total height of the door regardless of the elevation of the car floor and as close to the door posts as possible, thus avoiding any undue damage to the grain door. This, in itself, is quite an economy, as by the old hand method doors were invariably broken.

The opener enters the grain with an upward and inward movement, carrying the door above the grain toward the roof of the car and clear of the flow. The pressure of the grain against the door is released by the leakage of grain into the hopper, which occurs as soon as the smallest opening is effected, and the outward flow of grain allows an easy clearance space through which the door can be pushed. During this operation about 10 per cent of the grain in the car is discharged into the hopper.

Baffles

While the door is being held up inside the car by the opener, the cradle is tilted through an angle of about 20° and about another 25 per cent of the grain is discharged into the hopper, the remainder running down toward the other end of the car. The baffles are arranged so that they are tilted with the car and cradle, and while the car is in this position the upper baffle is inserted into the car as far as possible without crowding on the grain. The car is now tilted to an angle of about 40° in the other direction, when about another 50 per cent of the grain strikes the baffle and is discharged into the hopper. The baffle which is in the car, and which was in the upper position, is now in the lower and can be easily withdrawn. At the same time the other baffle, which is now in the upper position, can be inserted, and as only 15 per cent of the grain remains in the car, the baffle can be pushed forward over the floor of the car until the nose reaches the far side. The car is now tilted through the maximum angle in the other direction when the last remaining portion of the grain is emptied into the hopper and the cradle can be brought into the horizontal position and the baffle withdrawn.

The baffles consist of a pair of plated rectangular structural frames of right and left hand, having their faces at right angles to the floor of the car, and capable of being slid into the car so that the rectangular face or the trace of the plane of the baffle, is at 45° with the longitudinal axis of the car. As stated before, this gives a trough having an angle of slope of 30°, when the floor of the car is tilted to 45°. Down this trough the grain will readily flow out of the car. A wire rope attached to the front end of each baffle, passes round a grooved operating drum and thence to the rear end of the baffle, so that the baffle can be pulled in or out of the car by rotating the drum. The rear end of the baffle is guided at its upper and lower ends in tracks having a setting and curvature specially designed to keep the overall width of the unloader down to a minimum while the front end passes through a pivotted yoke so that the baffle is held in its correct location for any position in or out of the car.

The elevation of the front yokes, and consequently the front end of the baffle, is determined by a vertical driving shaft to which the operating drum is also keyed. The upper end of this shaft is of square section, and is driven by a 5-h.p. motor through a worm and worm gear. The lower end is threaded and screwed into a sliding nut supported in a definite location so as to take the unbalanced weight of the baffle when not supported by the car floor. The front end of the baffle is balanced by an adjustable counterweight acting through the lower yoke to relieve the pressure on the car floor.

At the time of entry, the baffle is at least three inches above the highest car floor, but as it is driven forward is lowered by the screw and nut until contact is made with the floor and the weight is relieved from the sliding nut, after which any further driving forward of the baffle only causes the sliding nut to travel up the shaft without altering the elevation of the yokes. The back end is flexibly retained in its tracks in such a manner that the lower edge of the baffle makes contact with the car floor along its entire length. To further prevent the escape of grain to the lower end of the car, a flexible canvas sealing strip is attached to the bottom edge.

To prevent the flow of grain from travelling too far down the baffles, along the baffle track, and out of the hopper, spring doors are provided to seal the entrance of the baffle and to close the opening when the baffle is fully withdrawn. Flexible, hand operated, deflecting baffles are arranged to prevent leakage of the grain along the sides of the car, and deflecting plates are provided under the car door to carry the grain well into the centre of the receiving hopper. Steel gratings are also provided to protect the fixed hopper and to cover all spaces around the unloader, as well as to catch any large foreign substances which might come out of the car with the grain.

Safety Features

Throughout the design of the unloader, the choice of type and the choice of method of operation were, to a large extent, governed by the desire to obtain a maximum safety of operation, and particular attention has been paid to features governing this requirement. The cradle is in stable equilibrium under all conditions of loading, so that should a breakage occur in the tipping mechanism, the car and cradle will come to a horizontal position without damage. All power transmission is made through self-locking worm or screw gearing, so that motion cannot take place unless it is so intended by the operator. The operations are electrically interlocked, so that they have to be carried out in proper sequence, and so ordered that damage cannot occur to either the car or the unloader. Limit switches are also provided, where necessary, for limiting the travel of each mechanism.

A completely closed operator's house is placed at a good elevation opposite to the car door, and is provided with glass windows so that the operator can, at all times, observe the process of unloading. The house contains the complete electrical control board, controllers, and resistances, so that the operations are under the direct control of the operator.

Electrical Interlock

When the unloader is in a position to receive cars, i.e., with the end locks inserted in place and the bumpers fully lowered, it is possible to get current to the bumper motors only and in the raising direction. With the bumper clamps raised and in the nearly home position, a normally open hatchway switch is closed allowing the end locks to be withdrawn. When these are fully withdrawn, a switch limits their travel and allows the operation of the door opener, rotation of the cradle, and insertion of the baffles, otherwise these motions are impossible. Three normally closed hatchway switches prevent the operation of the bumpers, end lock and door opener, either when the cradle is off the level, or when the baffles are inserted in the car. The door opener is limited in both directions by an L.S. 34, geared type, limit switch, which allows the operation of the bumpers and end locks when the door opener is in the out position only. The baffles and cradle rotation also have switches limiting their motion in either direction. The following is a list of switches giving conditions, type and duty:—

	Conditions	*Type*	*Duty*
1.	Baffles out and cradle level.	3 normally closed hatchway switches.	Prevent operation of bumpers, end lock, and door opener, if cradle is off level, or if the baffles are inserted.
2.	Door opener out.	L.S. 34 geared type (limits in both directions).	With door opener out, L.S. 34 allows operation of bumper and end lock.
3.	Bumper clamps fully lowered.	Normally closed hatchway switch.	Open when clamps fully lowered. Reverse operation only possible.
	(Above conditions allow car to be run on to cradle.)		
4.	Bumper clamps raised.	Normally opened hatchway switch.	Closes when clamps are nearly home, allowing end locks to be withdrawn.
5.	End locks withdrawn.	L.S. 20 XA.	Allows operation of door opener, rotation of cradle, and insertion of baffles (otherwise impossible).
6.	One baffle in.	4 normally closed hatchway switches (2 for each baffle).	Open singly at limit of travel of baffle in either direction allowing only reverse motion.
7.	Cradle rotates.	L.S. 34 geared type.	Limits rotation of cradle to 45° in either direction.

Time of Operation

The average time taken by the various operations in unloading a car of wheat is as follows:—

Raising bumpers and centering car	40	seconds
Withdrawing end locks	10	"
Opening door (10% of grain discharged to hopper)	15	"
Tipping cradle 20° to left without baffle (further 25% of grain discharged)	20	"
Insert baffle and tip cradle 40° to right (further 50% of grain discharged)	40	"
Withdraw right baffle, insert left, and tip cradle 45° to left, (final 15% of grain discharged)	50	"
Withdraw left baffle and bring car to horizontal	10	"
Withdraw door opener	12	"
Insert end pins	10	"
Drop end bumpers and inspect car	30	"
Complete time of operation	237	"
	(or about 4 minutes)	

The time taken to remove the empty car and spot a loaded car on the unloader platform depends, in a large degree, on the trackage layout. At the Canadian National Railways' elevator this occupies about three minutes, and the results obtained by observation show that where wheat is being unloaded, and no delays in distribution occur, it is easily possible to unload at the rate of eight cars per hour. When unloading oats, the time of operation is about one minute longer than that heretofore detailed, as the car requires at least one extra tipping of the cradle. Further, the time of operation over long periods of unloading is certain to be increased by delays incidental to distribution and other causes. Results, however, show that about 250 cars can be unloaded in a ten-hour day, on four unloaders at the Canadian National Railways' elevator, or an average of six and one-quarter cars per unloader per hour.

Power Consumption

As all of the auxiliary motors are of small capacity, and are only required to operate for a few seconds, twice during each cycle of unloading, their power consumption is of small moment. The tipping motor, operating for about two minutes during each cycle and being of 75-h.p., capacity is, however, a very important factor. The size of this motor was determined from the maximum out-of-balance load which could be obtained under the worst conditions of loading, viz: by assuming the largest possible amount of grain which could be left in the upper end of the car when tilted to the maximum elevation.

This was found to be equal to approximately double the normal torque of a 75-h.p. motor at the motor shaft, and as it only occurs momentarily, and then only under the worst conditions, a 75-h.p. motor was chosen for operating the tipping mechanism. After actual conditions of operation had been determined by trial at the site, and again assuming the worst conditions of operation with a maximum loaded car, a horse-power curve was calculated and plotted on a time base. This curve agrees with the original idea regarding power requirements, and further, it is found that the average power required over a complete cycle of tipping is about 40 h.p.

Economy of Operation

The average rate of unloading in an elevator equipped with multiple pits and having a pair of power shovels at each pit is about one car per hour for a ten-hour day. While the unloader has an unloading capacity of at least six cars per hour over the same period. The average unloading staff in a house equipped with a number of pits is approximately two men per pit, while on one unloader, an operator, one attendant and two labourers, a total of four men are required.

As one unloader will do the work of six hand pits, the saving of labour is represented by twelve men on the hand pits against four on the unloader, or a saving of eight men, and the monetary saving is in the same ratio, as the shovellers can be put on the unloaders as operators with very little training. Assuming a period of work during the year equivalent to the employment of the maximum staff for 200 days, the saving in labour will amount to 1,600 men-days. To convert this into dollars will of course depend on the rate of pay for this class of work, but assuming a rate of $5.00 per day, would amount to a saving of $8,000. per year per unloader. There is also a further saving due to the grain doors being removed undamaged. Maintenance costs are smaller than for an equivalent number of power shovels. The labour turnover and the danger of tieing up operation by strikes is naturally lessened on account of the very great improvement in working conditions. Power costs are rather less for one unloader than for six shovels. The initial cost of installation will, of course, depend upon conditions at different elevator sites, but will in many cases permit of a saving due to a less expensive trackage layout.

The question of the economy of installation in existing elevators is one which would have to be studied for each separate case by expert elevator engineers. The writer believes, however, that where a large volume of grain is handled that a study of the question would be well worth while and that unloaders can be installed to advantage in most existing elevators.

There is no doubt that grain car unloaders represent a marked advancement in the method of handling grain at this point in its transportation, and their application should be thoroughly considered, if only for the better working conditions which they give to elevator labour.

The unloaders were designed by the Dominion Bridge Company, Limited, in collaboration with C. D. Howe and Company, consulting engineers of Port Arthur, and were built and erected by the Dominion Bridge Company, Limited.

The Chemistry of Portland Cement and its Disintegration by Alkaline Ground Waters.

Professor T. Thorvaldson

Professor of Chemistry, University of Saskatchewan.

Paper to be presented at the General Professional Meeting, Winnipeg, Man., September 7th, 1922

The problem of the so-called "Action of Alkali on Concrete" is generally considered to be peculiar to the prairie provinces of Canada and the corresponding states south of the international boundary. There is no doubt that those regions of the prairies, having a low rainfall and poor drainage, present extraordinary conditions in respect to the amount of soluble salts present in the soil. The experiences of engineers in the dry belt of western Canada and the western states have indeed brought this problem very forcibly to the attention of scientists and the general public.

Analysis of the ground waters on the prairies indicate that high concentration of dissolved salts is fairly general both in the surface stratum and at lower depths. Shallow wells, and excavations for foundations of buildings, very commonly give seepage water having a concentration of one-half of one per cent up to even six per cent or more. In Saskatchewan, at least, water from deep wells, where a large supply of water under pressure is struck in the lower strata, has commonly total solids of one-half of one per cent.

Analysis of Water from the Prairie Provinces

The dissolved salts are, in general, mainly sodium, magnesium and calcium sulphates. Occasionally there is a large quantity of common salt present as well. Typical analysis of three waters taken near cement structures in the three prairie provinces follow:

	*Manitoba**	*Saskatchewan*	*Alberta*
		Parts per Million	
Total solids	20,022	16,010	18,492
Sulphate (SO_4)	14,180	11,090	12,153
Chloride (Cl)	440	331	trace
Carbonate (CO_3)	413	255	429
Calcium (Ca)	524	433	432
Magnesium (Mg)	2,560	1,771	607
Sodium (Na) (by difference)	1,948	1,863	4,505

Expressed in hypothetical combinations, as weight of each substance, in grams, per 100 cc.

	Manitoba	*Saskatchewan*	*Alberta*
Sodium sulphate (Na_2SO_4)	0.52	0.51	1.39
Magnesium sulphate ($MgSO_4$)	1.27	0.88	0.31
Calcium sulphate ($CaSO_4$)	0.08	0.09	0.03
Calcium carbonate ($CaCO_3$)	0.07	0.04	0.07
Sodiumchloride (NaCl)	0.07	0.05	trace
Total solids	2.01	1.57	1.80

In the above samples of Manitoba and Saskatchewan waters magnesium sulphate predominates, while in the Alberta water sodium sulphate is present in larger quantity. Waters of the latter type are also quite common in Saskatchewan. The differences in actual concentrations of these three waters are not significant as the seasonal variations of concentration are large.

*The figures for the Manitoba water are from analysis kindly supplied by A. Blackie, city chemist, Winnipeg.

Reasons Advanced for Failures in Concrete

Until lately all failures of concrete were attributed to defective concrete, the defects being supposed to have existed either in the cement or aggregate, or in the method of manufacture of the concrete. Perhaps the only exception to this was when some engineers considered that failures of concrete structures exposed to sea water were due to the salts in the sea. The best known of these failures was that of the dock at Aberdeen, Scotland, built in 1875, of which a description is given in the Proceedings of the Institution of Civil Engineers, in 1891. Other cases occurred at Hartlepool, Sunderland, Scarborough and Belfast where docks failed to stand up. Engineers, however, did not reach a unanimous opinion as to the causes of these failures. Some thought that the failures were due to a cement too high in lime, and that the magnesium chloride in the sea water combined with this. Others thought that the cause lay in too high a percentage of magnesia in the cement. In 1871 Dr. Michaelis, of Berlin, published a paper on "The behavior of Portland Cement in Sea Water", in which he stated that, "The salts contained in sea water, especially the sulphates, are the most dangerous enemies of hydraulic cements". In the case of the failures at Scarborough, investigation was made by B. D. Butler and the conclusion arrived at, that the damage was due to land water containing sulphates. He says, "Waters containing calcium or other sulphates are a serious source of danger to cement concrete exposed to their action, and they are liable to attack the cement and to cause deterioration, with, in extreme cases, disintegration of the mass".

While the evidence as to the cause of failures of concrete structures in sea water is very conflicting and in Great Britain, at least, the general opinion seems to be that well made structures of dense concrete will stand up indefinitely where they are constantly immersed in the sea,[1] yet there is no longer any doubt that well made concrete, manufactured from the best of materials, will not stand up long if in contact with such ground waters as the three of which analysis is given above.[2] In the case of dense concrete in contact with such solutions, the outer layer softens slowly and all cohesion between the cement and aggregate disappears. This action proceeds gradually inwards. Often the outside has a blistered appearance which is due to breaks in a

thin shell of calcium carbonate formed on the outside, while the damage proceeds beneath. If the concrete is porous, action will take place throughout the mass instead of proceeding gradually from the outside. In walls or floors made of such concrete where evaporation can take place; as for instance inside of a basement; incrustations, composed mainly of sodium sulphate, form. The salt solution penetrating the wall from the outside evaporates leaving the salts on the inside of the wall. This occurs also commonly on concrete structures just above the water line, at the surface of a damp soil rich in sulphates, or at the level to which the soil solution rises by capillary action. Thus while the water penetrating the concrete may not have a high concentration of sulphates, increase in concentration takes place through evaporation until the solution is saturated. On further evaporation incrustations of salts form on the concrete structure. This explains why "alkali" action usually appears first, in foundations of buildings, at the surface of the soil, or at the upper limit to which the soil waters commonly rise. The concentration of the salts in the water further down in the soil may be fairly low so that the action appears there later, or even may not appear at all if the concentration is too low.

Constitution of Cement

The question then presents itself as to the nature of the action of these salts on the concrete. Before one can inquire into this matter it is necessary to have a clear idea as to the nature of concrete. The part of the concrete which is acted on is the cement, and thus we have to study the constitution of cement before we can draw conclusions as to the action of salts on it. Before proceeding further it is therefore necessary to summarize briefly the work on this subject to date, especially the results of the work of P. H. Bates, A. J. Phillips and A. A. Klein of the United States Bureau of Standards,[3] and of E. S. Shepherd, G. A. Rankin and others of the Geophysical Laboratory of Washington.[4]

Perhaps the first definitely planned research on cement was carried out by John Smeaton in 1756 when he determined to attempt to find "the most perfect cement possible" for the building of the Eddystone lighthouse. He found that for mortar, to be used in water, the purest lime was not the best, but that the lime giving the best results was really chalk impregnated with clay. Pure lime would not harden under water while burnt clayey lime did harden. Thus he obtained a hydraulic lime mortar, which when mixed with pozzolana — a pumice-like material of volcanic origin — produced a satisfactory mortar for the lighthouse. While this may be considered the beginning of the cement industry, the material was not constitutionally, except in a slight degree, like Portland cement of to-day. The name "Portland cement" appeared first in 1824, when Joseph Aspdin, a bricklayer of Leeds, took out a patent for making a cement from limestone and clay; the name being taken because the set product resembled the stone quarried at Portland, England. This cement was burned at a low temperature without the formation of clinker which is formed by partial fusion. The hard product when formed by "overburning" was generally rejected, although it was more like the Portland cement of to-day. Later the value of the hard-burned product was recognized and the production of Portland cement, as we know it to-day, began shortly after the middle of the 19th century.

The pioneer work on the constitution of cement was done by a number of men of whom one might mention Bergman of Sweden, Saussure of Switzerland, and Vicat of France. The last named, who may perhaps be considered the founder of cement chemistry, explained the hardening of hydraulic lime by chemical action of the lime on the alumina and silica, while ordinary mortar made of rich lime and sand required carbon dioxide for hardening, and if excluded from carbon dioxide remained soft for a number of years. On the other hand rich lime mixed with finely ground pozzolana hardens in a short time in water, the lime and the pozzolana combining chemically.

In 1887 Le Chatelier[5] published a paper which is now a classic on the constitution of cement. The microscope and chemical analysis supplemented each other in his research. He concluded that Portland cement contains tricalcium silicate, tricalcium aluminate, "calcium ferrate", and "multiple silicates".

The work at the Geophysical Laboratory and the Bureau of Standards, Washington, indicates that the chief constituents of well burnt clinker of Portland cement are tricalcium silicate ($SiO_2.3CaO$), dicalcium silicate ($SiO_2.2CaO$), tricalcium aluminate ($Al_2O_3.3CaO$), and clay or glass high in oxide of iron, with 5.3 calcium aluminate ($5CaO.3Al_2O_3$) and calcium oxide as minor constituents. These conclusions have now been generally accepted.

Let us try to follow what happens during the burning of Portland cement, and instead of taking the usual materials let us begin with the pure oxides of calcium, aluminum and silicon in the proper proportion for Portland cement;[6] (say $CaO = 68.4$; $Al_2O_3 = 8.0\%$; $SiO_2 = 23.6\%$). While raising the temperature to 1,000°C we can consider that nothing happens, unless the lime was present in the beginning as calcium carbonate, in which case the carbon dioxide of the limestone would be evolved. Above 1,000°C the lime begins to combine with the silica to form dicalcium silicate ($2CaO.SiO_2$). The calcium oxide also combines with the alumina to form the 5.3 calcium aluminate ($5CaO.3AlO_3$), while there still remains a large excess of free lime. As one continues to raise the temperature some of this free lime combines with the aluminate to form tricalcium aluminate ($3CaO.Al_2O_3$). At 1,335°C flux, or molten liquid, first appears as this is the eutectic temperature for the system composed of the above three compounds, namely, dicalcium silicate, tricalcium aluminate, and 5.3 calcium aluminate. As the system is heated above this temperature a new reaction begins, the free lime combining with the dicalcium silicate to form tricalcium silicate ($3CaO.SiO_2$). The 5.3 calcium aluminate also combines completely with the free lime to

6. G. A. Rankin — The Constitution of Portland Cement Clinker, J. I. E. C. 7, 469 (1915).

form tricalcium aluminate. At about 1,475°C the calcium aluminates have disappeared entirely into the liquid phase, while free lime, dicalcium silicate, and tricalcium silicate, remain in the crystalline condition; the last growing in amount rapidly at the expense of the two former. If kept above this temperature, but below 1,650°C the reaction will run to completion, the lime disappearing entirely and on cooling the charge crystallizes completely, giving a clinker approximately of the composition 45 per cent tricalcium silicate, 35 per cent dicalcium silicate and 20 per cent tricalcium aluminate. If instead of stopping at about 1,650°C the charge were heated above 1,900°C, the tricalcium silicate would dissociate into dicalcium silicate and free lime. If other substances, such as compounds of iron are present, as in the commercial burning of Portland cement, the flux appears at a lower temperature and complete burning will therefore take place at about 1,425°C with a corresponding change in the proportion of the main products present.

Properties of Main Components

We will summarize briefly the properties of these main components of normal Portland cement, as described by the experimenters mentioned above. ([3], [4] and [6])

Tricalcium Silicate — ($3CaO.SiO_2$). This compound is formed from dicalcium silicate and lime with alumina only above 1,335°C and is decomposed again when the temperature reaches 1,900°C. When mixed with water it has properties very similar to Portland cement, except that it is slightly less plastic. The plasticity is increased to that of Portland cement by the addition of 3 per cent plaster. The initial set is quicker than that of normal Portland cement. Briquettes made of this gain most of their strength within seven days and almost all in twenty-eight days. Tests on hydration show that most of this also takes place in the first seven days and almost all within twenty-eight days, giving a mass of very dense structure of gelatinous silicate interspersed with crystals of lime hydrate. Thus lime hydrate is formed during the hydration by the decomposition of the tricalcium silicate. Some of the most valuable properties of Portland cement are conferred on it by the tricalcium silicate which it contains, namely, those of setting within a reasonable interval, developing strength rapidly, and forming a non-porous dense mass.

Dicalcium Silicate ($2CaO.SiO_2$). This is a very stable compound as is seen from the fact that it is not decomposed at its melting point, which is about 2,130°C. When kneaded with water it has no plasticity and gives no true set. When in contact with water for two to three weeks it hydrates and hardens slowly, small amounts of lime being formed. It is thus much more stable than the tricalcium silicate in respect to water. In three to four months it has gained as great strength as the quicker setting tricalcium silicate. It has then a sandy structure containing voids or cavities in which water may freeze or salts crystallize, with attendant strain due to the physical forces of freezing or crystallization.

Tricalcium Aluminate ($3CaO.Al_2O_3$). This substance hydrates almost instantaneously with great evolution of heat, and gives a "flash set" which is due to its agglomeration into masses with the hydrated material on the outside, preventing further hydration of the inside of the mass. On further addition of water the mass becomes plastic and does not again set or harden. A large amount of water is required for complete hydration, and the mass remains quite plastic for a long time.

It may seem peculiar, considering the apparent inferiority of the dicalcium silicate and the tricalcium aluminate to pure tricalcium silicate, that the last named is not used instead of Portland cement. Without going into details one can state that the reason is mainly one of cost, the pure tricalcium silicate not being obtainable at commercially practicable temperatures. Furthermore, tricalcium silicate is found as a primary phase only within the ternary system and alumina is the most convenient substance to use for this purpose. Then there are probably indirect advantages on account of the presence of tricalcium aluminate. Through its property of rapid hydration it assists in breaking up the particles of finely ground clinker. Its presence seems to speed up to a slight extent the hydration of the silicates. Furthermore, in the presence of free lime the aluminate is not so active with water and acquires some cementing qualities. The substances containing the iron and magnesia are not active and probably play no part in the hydration of the cement.

Process of Hydration

One may summarize the process of hydration of Portland cement thus: The tricalcium aluminate hydrates first and the physical disintegration taking place assists in the hydration of the silicates which follows. At first amorphous hydrated tricalcium aluminate is formed but this later crystallizes. Any small amount of free lime present hydrates and reacts with the aluminate, producing cementing effect. The next substance to react is the tricalcium silicate and the hydration of this is well advanced in seven days. After this comes the crystallization of the hydrated aluminate and the hydration of the dicalcium silicate. Thus early strength, (within twenty-four hours), is probably due to hydration of the aluminates and lime, the increase in strength up to seven days due mainly to the hydration of the tricalcium silicate, and the later increase in strength due mainly to the hydration of the dicalcium silicate.

Action of Alkali Ground Waters

How can we apply these facts to the better understanding of what happens when alkali ground waters act on set Portland cement. Experiments on the preparation of concrete using water containing a high concentration of alkali salts indicate that the early development of strength through hydration is not interfered with. Cement briquettes will develop nearly full strength when cured in sulphate solutions of a concentration which later causes disintegration. Thus the alkali disintegration seems to be so slow in its action that the effect on the fairly rapid process of hydration is not noticeable. It is, therefore, likely that the action of the alkali is on the products of hydration of the chemical compounds in cement clinker. These products are some crystalline,

some colloidal, and some present in condition sometimes described as solid solution. A variety of different chemical, colloidal and physical effects may, therefore, be involved in the process of disintegration.

Work done at the Bureau of Standards, Washington,[7] the Montana Agricultural College,[8] and at the Universities of Wyoming[9] and Saskatchewan, has brought out certain facts as to the chemical changes which take place when concrete disintegrates in solutions of sulphates.

(1) The simpler silicates, in general, when treated with water hydrolyze, the water becoming alkaline and the solid becoming richer in silica.

(2) During the hydration of the calcium silicates present in Portland cement, hydrated lime is formed with hydrated silicates of higher silica content.

(3) If the hydration takes place in pure water, in a system of limited capacity, equilibrium is soon attained and this prevents further extraction of the hydrated lime from the concrete.

(4) When water in contact with the concrete contains temporary hardness or carbonates, the hydrated lime reacts with this, forming a shell rich in calcium carbonate on the surface of the concrete.

(5) When water in contact with concrete contains sodium sulphate in solution the sulphate is removed from the water, and the water develops caustic alkalinity.

(6) When water in contact with concrete contains magnesium salts as well as sulphates in solution, both the magnesium and the sulphate are removed from the water while the water remains nearly neutral.

(7) The hydrogen ion concentration of solutions of sodium sulphate in contact with hydrated cement does not vary with change in concentration of the sodium sulphate while the total alkalinity varies considerably.

(8) The hydrogen ion concentration of solutions of magnesium sulphate, or mixtures of sodium and magnesium sulphates in contact with hydrated cement, varies with the concentration of the magnesium sulphate present and, in general, in the same direction as the total alkalinity.

From these it is possible to decide *in part* what chemical reactions take place during the action of sulphate solutions on cement and concrete. The free lime produced during the hydration of the calcium silicates in the cement has a slight solubility in water. On account of the low solubility and the consequent tendency to attain equilibrium in a thin film of liquid on the surface, the extraction of hydrated lime from cement by pure water is slow. However, fair-sized crystals of hydrated lime may form on the surface of briquettes stored in distilled water. This leaching out of hydrated lime progresses most rapidly in the case of cements high in tricalcium silicate, while cements in which dicalcium silicate largely predominates are not so active. This statement holds in practice only for specimens of equal permeability to water, and since dicalcium silicate, after setting, is much more porous than tricalcium silicate this advantage of the lower silicate disappears in practice. If bicarbonates or carbonates are present in the water these react with the hydrated lime forming insoluble calcium carbonate which may form a protection against further removal of lime and a partial protection against the action of sulphates from the outside. However, this protection is usually quite inefficient, at best, delaying the sulphate action somewhat.

When sulphates are present in the water, in contact with the concrete, the conditions are entirely changed. The calcium of the hydrated lime reacts with the sulphate radical and calcium sulphate is formed. The solubility product for this substance is low, and the presence of a large concentration of the sulphate ion will therefore render it almost insoluble. It separates out of solution as the hydrated form of gypsum. The removal of the calcium from solution in this manner upsets the equilibrium between the dissolved and solid hydrated lime and speeds up the leaching out of this substance from the cement, while the moment it enters solution the calcium continues to be precipitated as gypsum. If the sulphate present is sodium sulphate, the liquid attains thus caustic alkalinity, while the sulphate disappears as gypsum into the solid phase. On the other hand, if magnesium salts are present as well as the sulphate, the hydroxyl ion is removed as magnesium hydroxide, and the liquid remains nearly neutral, while both the magnesium and the sulphate radicals disappear from the solution and enter the solid phase. Thus the presence of dissolved magnesium salts and sulphates in water which is in contact with cement or concrete, produces ideal conditions for the constant removal of lime from the lime silicates in the cement with the consequent weakening of the concrete and when carried to completion final loss of all cementing properties.

The theory that the disintegration is due to the physical forces exerted during the crystallization of gypsum in the voids in the concrete can hardly stand as a sole explanation. The amount of free lime in properly manufactured set cement is small and the combination of this amount with sulphate could not explain the observed effect. Continued extraction of lime is necessary and suitable conditions for this process are produced by the presence of sodium and magnesium sulphates. This alone is enough to cause the weakening of the concrete and loss of the cementing qualities of the silicates. The crystallizing of the gypsum no doubt contributes to the final results by causing fissures in the weakened concrete and thus facilitating the access of the harmful sulphate waters to the interior portions of the concrete.

One must not draw the conclusion that the above statement explains everything about the disintegration of concrete by sulphate waters. There probably are other contributing factors. There can be little doubt that the process described above can by itself cause complete disintegration of lime silica cements. But there may be contributing factors which, if excluded, would cause a slowing up of the action to such an extent as to lose its seriousness. At present the only remedy known is the manufacture of concrete of low permeability and high strength, and this is only an expedient for lengthening the life of the structure. The only certain remedy is the exclusion of sulphate waters of high concentration from contact with the concrete and tried, cheap, efficient means for this are not available. Substitution of the calcium aluminates possessing cementing qualities in place of the calcium silicates has led to the development of the so called "electric cement" and "ciment fondu" but further work is necessary before one can determine the resistance of these to the action of sulphate waters.

Turbines for the Great Falls Development of the Manitoba Power Company

Some Special Features of the 28,000-h.p., I. P. Morris Turbines being installed in this Plant.

H. S. Van Patter, A.M.E.I.C.,
Hydraulic Department, Dominion Engineering Works, Limited, Montreal.

Paper to be presented at the General Professional Meeting, Winnipeg, Man. September 7th, 1922

The object of this paper is to supplement the description of the new hydro-electric development at Great Falls, presented at this meeting by F. H. Martin, M.E.I.C., by pointing out a few of the special features of the I. P. Morris turbines for this plant, which are now nearing completion in the shops of the Dominion Engineering Works, Limited, of Montreal; also to use these turbines as an illustration in describing in a general way some recent notable advances in water wheel design for medium and low heads.

As most of you are aware, the tendency in the hydro-electric field during recent years has been towards larger and larger units of the vertical-shaft, single-runner type. This has been made possible by the development of the direct connected hydro-electric unit and the satisfactory solution of the thrust bearing problem. With this type of unit, operating under medium and low heads, the question of speed is, for economical reasons, very important. Higher speeds mean smaller and more efficient generators, lighter overhead construction, and smaller power-house cost. The limit of speed obtainable for large capacity units under low heads has been and still is determined by the limits of turbine development. However, great progress has been made by turbine designers within the last few years, and the most striking example of progress is to be found in the new development of the Manitoba Power Company.

Until quite recently the standard turbine runner for low head installations has been the Francis mixed-flow, i.e., inward- and downward-flow, type. With this type of runner specific speeds around eighty English units have been in use for some time with high efficiencies. Beyond this point, however, progress has been very slow until the recent development of a new type high speed runner, generally known as the "propeller" type, — its name resulting from the close resemblance it bears to a marine propeller. It has three to six vanes mounted on a central hub, and is usually unshrouded, i.e., there is no surrounding band. The new units at Great Falls are to be equipped with this new propeller type of runner.

Turbines at Cedar Rapids Plant

To illustrate the advantages of the high speed wheel and to point out more clearly some other features of the Great Falls turbines, a comparison will be drawn with the 10,800-h.p., units in the Cedars Rapids plant of the Montreal Light Heat and Power Consolidated. These units are also of I. P. Morris design and, when installed about eight years ago, were of the highest speed type then available. Figure No. 1 shows a sectional elevation of one of these units, the largest from point of view of actual dimensions now in operation. It will be noted that this unit is of the vertical-shaft, concrete-casing type, equipped with a Francis mixed-flow runner. The incoming water flows around the spiral casing, through the stationary vanes of the speed ring and the movable guide vanes, and strikes the outer portion of the runner vanes while still moving in a horizontal direction. In passing through the runner the flow changes from radial at inflow to axial at discharge, that is, neglecting the whirl components of velocity.

These Cedars units, as originally designed, have a rated horse-power of 10,800 and operate at 55.6 r.p.m., under a normal head of 30 feet. The last two units installed were increased in capacity to 11,300 h.p., by cutting back the outflow edges of the runner vanes. On account of the low speed, the generator, as you will note from figure No. 1, is of a very large diameter. The outside diameter of the stator frame is about 37 feet 4 inches, and the flywheel effect of the generator rotor 31,000,000 pounds-feet squared. This means high generator cost.

The runners of these units have a throat diameter of 182.75 inches, and on account of their large size were made in four cast iron sections, held together at the top by a cast steel crown plate, and at the bottom by a cast steel band. Each section contains four vanes. The result is a very heavy and expensive runner, the total weight being about 175,000 pounds. The speed ring, which stays together the concrete above and below the spiral casing and takes the downward thrust of the generator and surrounding concrete, is of the solid type with vanes cast integrally. The total weight of the bare

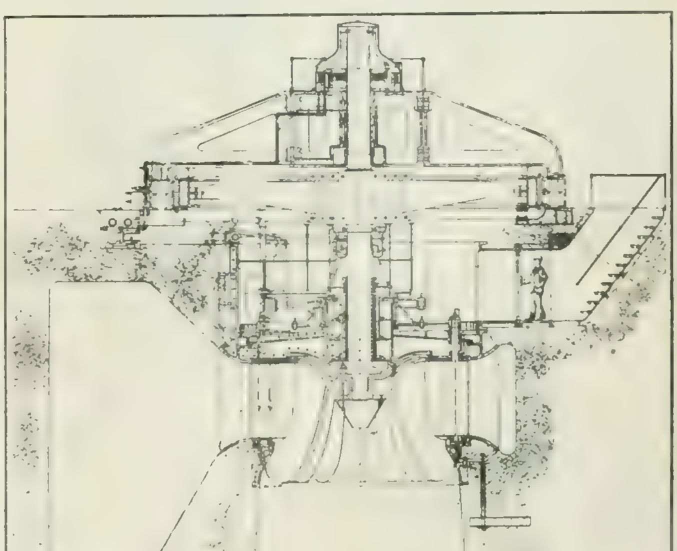

Figure No. 1. 10,800 h.p. Turbine in Cedars Rapids Plant of Montreal Light Heat and Power Consolidated.

turbine, not including governing mechanism or pumping system, is about 1,000,000 pounds. The draft tubes for the Cedars units are of the curved type, which at the time of installation was generally regarded the best to use when a straight tube would require too much costly excavation.

Great Falls Turbines

Let us now consider the new 28,000-h.p., units which are being installed by the Manitoba Power Company. These turbines will develop this power when operating under a head of 56 feet, at 138.5 r.p.m., as compared with 75 r.p.m., using the Cedars type of runner. The Cedars units, as originally designed, would develop about 27,500 h.p., and the last units installed in that plant about 28,800 h.p., under the higher head of 56 feet, so that a comparison with the Manitoba units is a fair criterion of the relative merits of the types of runners used in the two installations.

Figure No. 2, shows a sectional elevation of the Great Falls turbine and draft tube with an outline view of generator, thrust bearing, and direct connected exciter. The most striking variations from the Cedars units lies in the design of runner, speed vanes and draft tubes, and

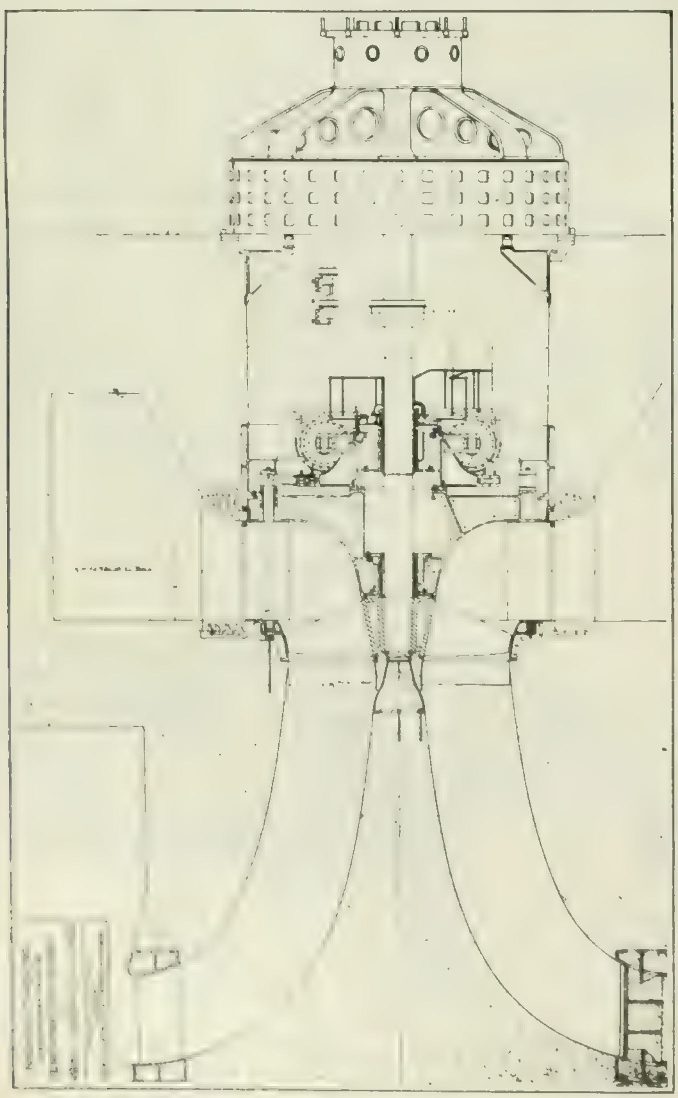

Figure No. 2. 28,000 h.p. Turbine for Great Falls Plant of Manitoba Power Company.

the dimensions of the generator. In this turbine there is a much larger whirl chamber between guide vanes and runner vanes. The runner is of the Moody diagonal type in which, neglecting the whirl velocity as before, the flow is diagonal at intake and axial at exit. The speed of revolution of this runner is remarkable, — the circumferential velocity of the vane tips being about 7,000 feet per minute, nearly twice the spouting velocity of the water for a head of 56 feet. As shown in figure No. 2, this high speed results in a much smaller generator than for Cedars. The outside diameter of the stator frame being only 24 feet and the flywheel effect of the generator rotor 18,000,000 pounds-feet squared. The higher speed also allows the use of a direct connected exciter, whereas separate water wheel driven exciters are used in the Cedars plant. There is no solid speed ring for this unit. The speed vanes are cast separately, the ends being imbedded in concrete and anchored by foundation bolts. The draft tube is of the Moody spreading type with central concrete cone running up to the runner, and with supporting cast iron vanes for the surrounding apron.

The very simple construction of the propeller type runner as compared to the Francis type, is shown by figure No. 3. The outer band is eliminated, and the runner vanes have very little curvature, thus cutting down the liability of corrosion. The number of vanes is only six as compared with sixteen for Cedars. This means much wider space between vanes, and little danger of clogging from ice or debris. The intake racks also may be spaced wider in proportion.

The throat diameter of the Great Falls runner is slightly greater than for Cedars, being 189½ inches, but the overall height is only 4 feet 5¼ inches, as compared with 11 feet 9 inches for Cedars. It is made of cast steel in one piece, and the estimated weight is 65,000 pounds, less than half the weight of the Cedars runner. Another advantage of this type of wheel is its great mechanical strength on account of the longer connection between vanes and hub, and the little overhang of the vanes as compared with the Cedars type. The separate speed vanes furnished with these units represent a new style of construction used here for the first time. These vanes are built in with the forms for the concrete, and securely anchored by long foundation bolts. Lugs are cast on the vanes at the top and fitted with adjusting screws for the proper setting of the pit liner with relation to the draft tube ring. This construction means a considerable saving in material and machine shop labour but, on account of the greater erection cost, it will probably only find application in large units of the type under discussion.

The heaviest casting for this unit is the head cover, which is supported by the pit liner, and in turn supports the lignum vitae bearing for the main shaft. It is built in halves on account of its large size. Its lower surface takes a cone shaped form to conform with the flow lines of the water. The forged steel shaft for this unit is slightly smaller than for Cedars even with the much greater horse-power, its diameter being 24 inches, compared with 25 inches for Cedars. The cast steel guide vanes are the largest yet constructed, their height being 7 feet 1¾ inch and width 4 feet 7 inches. They are fitted with separate stems which rotate in bronze bushed bearings in the distributor plate and head cover, and are connected by levers and double acting shearing links to the cast iron operating ring. The shearing links are so constructed that in case of any obstruction lodging between two

guide vanes when the gates are closing, or guide vane and speed vane when the gates are opening, the connecting link will shear before any damage is done to the rest of the mechanism.

There are other special features of these units which should be mentioned. The guide vane bearings are assured of an ample supply of grease at all times by the use of the Taylor pneumatic greasing system. With this system an air operated grease gun is supplied for each unit with the necessary piping to give a separate lead to each bearing, so that each bearing may be greased independently by opening a plug cock. The high pressure used ensures adequate lubrication with a minimum of operating labour.

Another feature is the automatic method used for changing from governor control to hand control, or vice versa. This is effected by the use of hydraulically controlled needle valves in the governor pressure and exhaust lines, instead of the old type with gate valves. With the old arrangement two or three men were needed to change the control, but with the new device one man can do so with ease.

The bypass and receiver provided on the governor pressure system is also worthy of mention. This consists of a needle valve discharging a certain quantity of water at all times into a cylindrical receiver connected with the sump tank. The object of this device is to allow constant operation of the pumps without overheating. There is circulation of water through the pumps at all times and the pressure rise is considerably less on account of this bypass.

The total weight of one of these turbines, exclusive of draft tube vanes, governing mechanisms and pumping system, is about 630,000 pounds. This reduction in weight from the Cedars unit is largely due to the new type of runner and the separate speed vanes.

Special Type of Draft Tube

Of late years there has been a growing realization of the importance of draft tube design, particularly for low heads where the velocity head at discharge from the runner is a large percentage of the total head on the plant. For the Great Falls units this percentage is about 30 at full gate, assuming an angle of whirl of 30 degrees, so it is at once evident that an efficient draft tube is highly important. The spreading type of tube with central cone, as developed by Lewis Moody of the Wm. Cramp and Sons Ship and Engine Building Company, is being installed for these units. This tube is constructed on the principle of an inverted vortex. You all have noticed the action of water flowing out through a hole in the bottom of a circular basin, how the velocity of whirl increases rapidly towards the center, and how the surface takes a curved form with a central space running down through the orifice. The action of the water flowing through the Moody tube is just the reverse of this vortex flow. Both the axial and whirl components of velocity are regained as the water moves down the tube until the lower velocity permits the turning of the water towards the tail race without undue loss. The ability of this tube to regain the whirl components of velocity gives it a decided advantage over most other types. The central cone conforms to the natural flow lines of the water, as determined by the outer surface of the tube, and eliminates the tendency to form a central vacuum, which would cause upward eddies in the central portion of the tube and loss in efficiency.

The questions of unit spacing and depth of excavation allowable, are important factors in determining the exact shape of draft tube and water passages. In this installation the unit spacing is somewhat restricted so that the depth of draft tube and surrounding water passages is greater in proportion. The overhanging apron is supported underneath by eight cast iron draft tube vanes. These vanes are so shaped as to assist in turning the outflowing water towards the tail race. They are designed to support the total superimposed weight of turbine, generator, concrete and water in the casing. Their use means a great saving in the cost of concrete reinforcing.

No paper on this type of hydraulic turbine would be complete without reference to the engineers who deserve the chief credit for its development. In Europe, Robert Dubs of Switzerland, and Victor Kaplan of Austria, have developed high speed runners of this general type. The Dubs runner is shrouded, while the Kaplan is unshrouded. In America, Forrest Nagler of Milwaukee, and Lewis Moody of Philadelphia, have each developed high speed unshrouded type runners. The Nagler runner is of the strictly axial flow type, while the flow in the Moody runner is diagonal at intake and axial at discharge.

The turbines at Great Falls will be equipped with the Moody type of runner designed by the Wm. Cramp and Sons Ship and Engine Building Company of Philadelphia. This company, in keeping with its past reputation for high class design, based on an abundance of experimental data, have gone to a great deal of trouble

Figure No. 3. Comparison between Propeller and Francis Types of Turbine Runners.

and expense in developing the new type of runner. In their modern hydraulic laboratory at Philadelphia, an exhaustive series of tests was carried out, using a 16-inch diameter wheel operating in an open flume setting. The turbine is direct connected to a hydraulic friction brake and dynamometer scales and the quantity is measured over a carefully calibrated weir. By means of an electric clock and bell system the various observers take readings simultaneously. Each individual run is of two minutes duration with readings taken every fifteen seconds. By a simple device for changing the angles of and the number of the runner vanes, each shape of vane tested was given a most thorough tryout. In conjunction with the runner tests, a careful investigation was made to determine the best arrangement of draft tube.

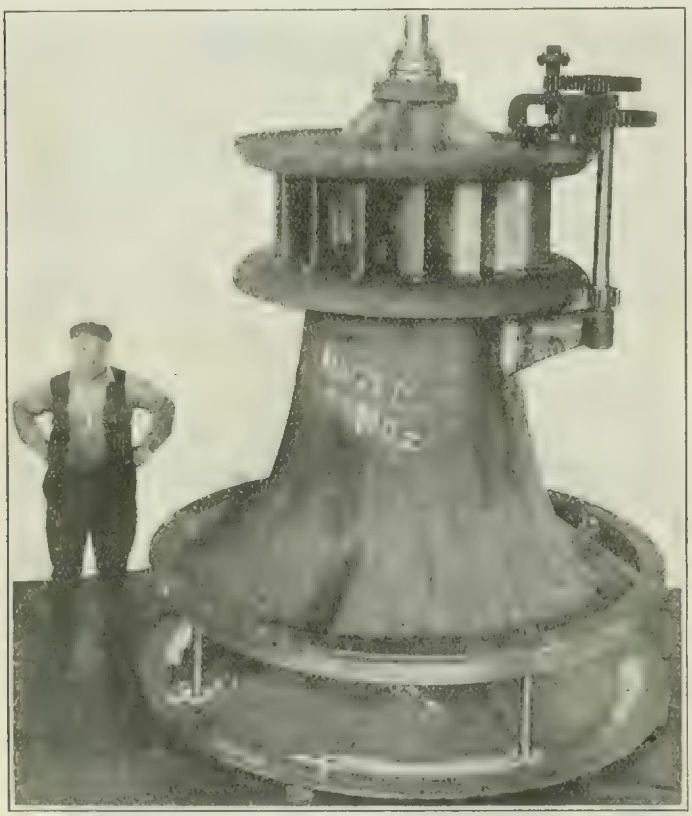

Figure No. 4. Manitoba Model Turbine for Holyoke Test.

Results of Tests

After a considerable number of runners had been tested, the three which showed the best results were picked out for test at Holyoke. A 35-inch model was then constructed and tested at Holyoke. Figure No. 4 shows an assembly view of this turbine. It is of the open flume type and is fitted with Moody draft tube and cone of cast iron exactly homologous to the Manitoba draft tube. The propeller type of runner shown in figure No. 4 is the 35-inch Holyoke model of the runner which was chosen as the most suitable for the Great Falls installation. This runner gave a maximum efficiency of 88.5 per cent at Holyoke.

A comparison of the horse-power efficiency curves for the Cedars model and some Moody model runners is shown by figure No. 5. These curves are plotted from the test results of the 16-inch experimental turbines, and so the efficiencies shown are considerably less than obtained at Holyoke, for which official results are not yet available. The dotted curves are for the Cedars model runner with curved and Moody draft tubes. This runner gave a maximum efficiency of 90 per cent on Holyoke test. It will be noted that the Moody tube gives a considerable increase in efficiency at part gates. The Moody tube also gives an appreciable gain in maximum power, showing about 7 per cent over the curved tube in this test. The full curves are for Moody high speed runners at specific speeds of 110, 125 and 153. As the speed increases the part gate efficiencies fall off appreciably. This, of course, is a big disadvantage for installations with a small number of units when the load is variable. However, with the increasing tendency to link up such small stations with others in the vicinity, this point becomes of small importance. Also, by going to a somewhat lower speed, very good part gate efficiencies may be obtained, as shown by the curves for model No. 81, and a considerable saving in cost will be effected as compared with the Francis type turbine. This model, No. 81, gave an efficiency of about 91 per cent at Holyoke.

The results of these tests have been most satisfactory, and as a consequence, it is safe to say that turbines of specific speeds up to 160 can now be built with maximum efficiencies comparable with the lower speed Francis type turbines. This means that many low head water power sites, which heretofore have been regarded as out of the question on account of the high initial cost, may now be developed on a commercial basis.

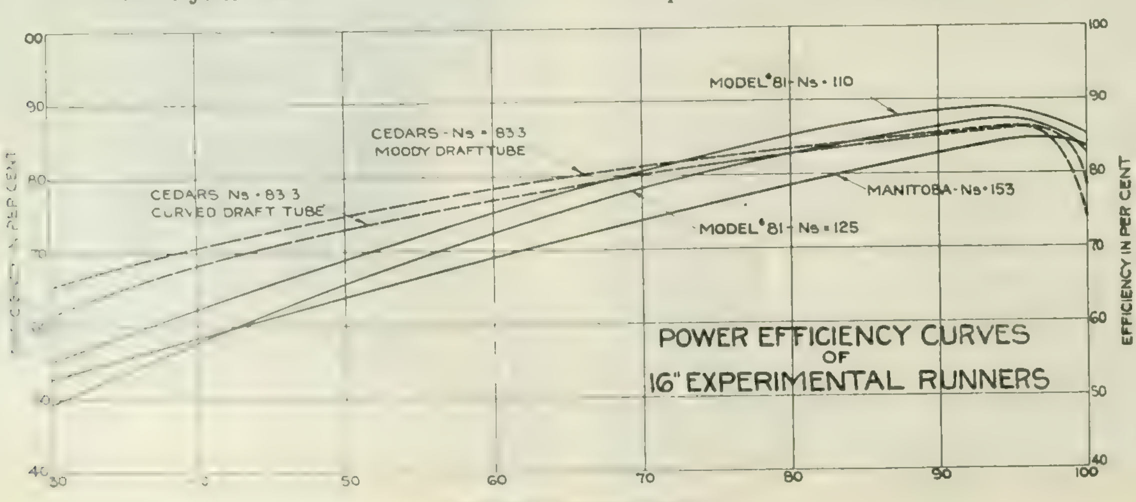

Figure No. 5.

Some Fallacies in Concrete Proportioning Theories.

A Review of Present-day Practice and Theories of Proportioning the Aggregates of Concrete.

Professor G. M. Williams, A.M.E.I.C.,
Professor of Civil Engineering, University of Saskatchewan.

Paper read before the Saskatchewan Branch, The Engineering Institute of Canada, at Moose Jaw, Sask, July 14, 1922.

During the past twenty years concrete has taken its place as one of the most useful and important of structural materials. Owing to the comparative ease with which it can be molded into any desired shape its structural uses are almost unlimited and its characteristics have resulted in its displacing older materials for certain classes of work wherever Portland cement can be obtained and suitable aggregates are available. The apparent ease with which concrete can be prepared has not confined it to use under the supervision of engineers as is the case of some types of engineering materials, but we find it employed by everyone who feels that the material is suited to his particular purpose. In many cases where proper skill is not at hand, concrete is little more than a bulky, heavy substance, lacking in great part the strength and other properties which should be attained, and often failing to fulfill the purpose for which it is intended.

To most users of cement who obtain such results, concrete is merely a shoveled-together mass of cement, aggregate and water which in a short time attains a certain degree of hardness and strength. To the engineer and skilled user who is more or less familiar with the many factors and variables which enter into its manufacture, the process of concrete making does not appear quite so elementary or so certain of results. Experience soon teaches that quantity and quality of cement, aggregates and mixing water, processes of mixing and curing are all involved in the production of concrete. Results are dependent upon all of these variable factors and it is the problem of the engineer to so control and vary these factors that a concrete having the desired physical qualities will result. To the onlooker the manufacture of concrete merely means the dumping of cement, aggregate and water into a mixer, thence transporting and dumping the wet mass into a mold which has been conveniently arranged in advance to receive it, but to the engineer the procedure is far more complex.

The manufacture of Portland cement itself is a large scale commercial operation carried on in large centralized plants under rigid and skillful control, and quality of the resulting product can be determined by certain standardized tests which are in general use. Likewise practical experience in actual construction work, together with laboratory investigations have resulted in a theory of design of reinforced members which is fully adequate and furnishes structures which favourably compare in cost and strength with the older types of structural materials. With a concrete of known quality the strength of the members composing a structure may be accurately computed and the values verified by actual tests when necessary. But, it is the problem of producing a concrete of definite and specified quality, with the many types of aggregates available, which has not been worked out to the satisfaction of engineers. The two other important elements, cement quality and design theory, have been well standardized, but the proper use of available aggregates to produce a definite quality of concrete is a constant source of worry to the engineer. To most engineers the discovery of some formula or equation in which he can substitute the variable factors as represented by his materials and job conditions and obtain by means of a slide rule such an answer as 1–2–4 or 1–3–6 would seem the ideal solution of the problem, and to this end numerous proportioning theories have been advanced, generally supported by more or less complete test data which appear to verify the correctness of the theory.

Before taking up several of these proposed proportioning theories in detail, it will be well to consider the present status of our knowledge of concrete and some of the factors which have influenced its formation. Years ago when concrete first came into general use it was common practice to use a very dry consistency, the concrete being so stiff that considerable tamping was required to bring moisture to the surface. Tests made in some localities showed such a concrete to have a compressive strength of about 2,000 pounds per square inch at twenty-eight days when proportioned, by volume, one cement, two fine and four coarse aggregates. Standard specifications for concrete as well as many individual specifications in the past have assumed 2,000 pounds as ultimate strength in structural design and called for a 1–2–4 volume concrete to be furnished. Lack of tests of field concrete has caused the continued use of these false assumptions, since it is now recognized that the cements and aggregates available in many localities cannot give a strength in excess of 800 to 1,500 pounds per square inch in such a proportion where workable consistencies are employed. Proper methods of inspection and test have shown that such a specification is inadequate to result in concrete of desired quality and the most discussed section of the proposed Joint Committee Specifications for Concrete and Reinforced Concrete, now being prepared in the United States, is that one which relates to the quality of concrete and a method of obtaining it.

While it has been known for years that quantity of mixing water has a very great influence upon concrete strength, regulation and measurement of consistency has generally been ignored in past specifications. Tests have shown that the use of excess mixing water, beyond that needed to result in a concrete which it is practicable to place, may reduce the strength to less than 50 per cent of that which might be obtained with the same cement content. That such a condition could have existed for so long a time is no doubt due to the fact that no satisfactory means were available for measuring and describing consistency. Within recent years two types* of apparatus have come into use, (a) the slump test, and (b) the flow table.

*For a description of both types see Canadian Engineer June 10, 1920.

The Slump Test

The slump test method was first used extensively in the field for controlling consistency of concrete in the construction of concrete ships by the Emergency Fleet Corporation. As first used it consisted of a cylindrical steel form such as is used for molding 6-inch by 12-inch cylindrical test specimens. This mold is filled in the usual manner and withdrawn vertically and the resulting height, in inches, of the concrete mass substracted from twelve, is known as the "slump". This apparatus is not sufficiently reliable or accurate to be adopted as a standard measure of consistency, since concretes having the same slump but varying in cement content or aggregate gradation may have widely different consistencies or flowabilities. On any job where the aggregate from day to day differs little in gradation, the slump apparatus will be found very useful in establishing a definite limiting value for consistency which must not be exceeded. However, in all cases a placeable concrete must be employed and the slump figure established must be based upon the conditions of the particular job. The slump value cannot be arbitrarilly established in advance except by previous experience with the same aggregates and cement quantities. The slump test apparatus can be made of much assistance in field work where its limitations are recognized, but any attempt to establish definite slump values in advance to apply to concretes on all classes of work and with widely varying aggregate gradations, is absurd.

The Flow Table

To supply the need for a consistency measuring apparatus which would be suitable and accurate enough for both field and laboratory practice the flow table was devised and standardized in the concrete laboratory of the Bureau of Standards. This consists of a metal covered table top mounted by means of a flanged coupling to the end of a short vertical shaft which carries at its lower end an adjustable bolt. Below the bolt is a cam having a throw of one and one-half inch attached to a horizontal shaft which is rotated by hand. One revolution raises the table top vertically and allows it to drop freely through a distance of one-half inch. Mortar or concrete is molded in a sheet metal form having the shape of a hollow frustrum of a cone, the form is removed and the table top raised and dropped fifteen times. The concrete mass flattens and flows out concentrically similar to a mass of concrete in pouring a floor slab when the wood form is vibrated. The spread, in inches, of the concrete on the table under the repeated bumping action divided by the original diameter and multiplied by one hundred is called the "flowability" figure. Tests show that flowability of any given cement-aggregate combination is directly proportional to change in quantity of mixing water, within the widest working limits of consistency, and that it is also proportional to velocity of flow in a steel chute. Continuous use of the flow table during the past three years, both in the laboratory and in the field has fully demonstrated its ability to accurately measure the consistency of concretes varying most widely in cement content and aggregate gradations.

Measurement of consistency has been dealt with in detail in the preceding paragraphs owing to the necessity for having a definite measure for this property of concrete, since compressive strength is in turn so greatly influenced by the water content. In studying proportioning theories and measuring the concrete making qualities of widely different types and gradings of aggregates, it is of fundamental importance that the consistencies of these concretes be equal. In the field the conditions of the work, such as size and shape of forms and quantity and arrangement of reinforcing steel, automatically establish a limit of dryness which cannot be exceeded, but in the laboratory, where a great amount of energy may be expended in molding a small test piece, the limitation as to dryness is not so apparent, and some mixtures, owing to difference of aggregate gradings, may actually be much stiffer thar others. Superior strengths obtained for some under suct conditions are not due to better concrete making qualitie of the aggregate but to the use of a smaller quantity o mixing water and one which would prove to be inadequat under field conditions. The use of the flow table wil result in the elimination of the consistency variable A second fundamental consideration in making com parative tests is the necessity for equal cement content per unit volume. Although dry proportions of material in all batches may be the same, the cement content i the wet concretes may differ owing to the greater bulkin effect or swelling of the mass when water is added. Sinc cement is the most expensive ingredient and also the onl strength furnishing component, it is essential that it quantity be the same in all concretes being compared.

Since most of the proportioning theories which hav been advanced deal with the selection of the aggregat it is a basic requirement that the variable factors, cemen content and consistency, be eliminated and made constant in comparative tests. As described above, equal cor sistencies can be assured by use of the flow table an equal cement contents can be provided by calculatin quantities of cement actually present in trial batches an by making proper adjustment of proportions whe necessary.

With the preceding considerations in mind a numb of the methods and theories proposed in the past f proportioning concrete will be discussed briefly. I general the methods proposed during the early years the development of concreting practice were concerne with the best combinations of aggregate particles, wit no attempt to predict strengths or satisfy specificatic requirements for strength. The water-cement ratio theo and the surface area theory of more recent years ha attempted to furnish a means of producing concrete any desired quality with wide variations in aggrega gradings, so long as the strength which will result fro any single grading is known.

Arbitrary Volume Proportions

This process is a method of proportioning rather th a theory. There are no considerations either practical scientific which justify the use of arbitrary volume prop tions. As stated previously, the almost universal assum tion that the proportions by volume of a 1 cement, pl 2 fine aggregate, plus 4 coarse aggregate will provide concrete having a compressive strength of 2,000 poun at 28 days is an example. This method fails to take in account the varying concrete making properties of differe

aggregates as well as variation in cement quality and its general use, in specifications for concrete, well illustrates the lack of knowledge of the various factors involved in the process of concrete making as well as failure to test concrete as placed on the job to insure that the specification requirement is being met.

Void Method of Proportioning

Several variations of the void method of proportioning have been proposed. In each case the idea has been to produce a concrete in which the void space will be a minimum. The assumption that the voids in coarse aggregate can be filled with sand particles and those of the sand with cement is, of course, erroneous since the smaller particles while partially filling void space also wedge apart the coarser particles. The best of concrete usually contains over 20 per cent void space, the higher the cement content the greater the void space and concretes having practically the same void space may differ several hundred per cent in compressive strength. In any case, after obtaining such an aggregate combination that the smallest possible void content will result, the strengths which will be attained by different cement contents must be determined by actual tests of the concretes. There is no feature in this method which permits the prediction of strength values and it is of little practical importance to the engineer.

Fuller's Theory of Maximum Density

In this theory* the assumption is made that with fixed cement content, an aggregate combined with cement, so graded as to have maximum density, will have maximum strength. It is claimed that with the same cement content strength will increase with increase in density. Such density increase can be obtained by regrading the aggregate. Sand and gravel or stone are separated into a number of sizes and re-combined so as to have a grading which will coincide with the "ideal" grading curve, or curve of maximum density, which was stated to be a combination of an ellipse and a straight line.

However, tests† of aggregates from numerous sources show that an aggregate can be screened and re-combined to have widely different gradings and yet produce concretes of approximately the same quality. Also with fine aggregates of the same grading, the relative proportions of fine and coarse aggregates may be so varied as to range over a broad zone when plotted graphically, and also produce concretes of different densities, but of approximately the same compressive strength. With the same cement content and aggregates from the same source of supply, the concretes of high density will usually have a relatively high compressive strength, but by changing the aggregate grading or by modifying the relative proportions of fine and coarse aggregate of the same grading a considerable decrease in density may result without lowering compressive strength. An aggregate so graded as to coincide with the "ideal" curve will often be lacking in fine particles, producing a harsh working concrete which segregates badly in the higher flowabilities.

The maximum density theory of proportioning is one application of the void theory. With equal cement contents the trend of increased strength with increased density is generally apparent, but in any case there may be so great a variation in density without lowering strength that it is difficult to see how the density factor can be made a criterion.

*Concrete Plain and Reinforced by Taylor & Thompson.
†Technologic Paper 58, Bureau of Standards.

Surface Area Theory of Proportioning Concrete

The surface area theory* of proportioning concrete assumes that strength is dependent upon the ratio of the weight of cement to surface area of the aggregate; that for a group of aggregates having different gradings and consequently different areas, and with cement content proportional to surface area, equal strengths will be obtained. A water formula was proposed which it was claimed would result in equal consistencies for such a group of mortars and concretes. However, tests† have shown that:

(a) This water formula furnishes such a quantity of water in each case that equal water-cement ratios will result; that is, the cement pastes alone will have equal consistencies with no allowance for the varying requirements of the sands which may differ greatly in surface area or fineness.

(b) The important property of surface area does not enter into the determination of the quantity of mixing water, except insofar as it fixes the quantity of cement at the beginning.

(c) The formula is not only incorrect in theory, but inadequate in practice and furnishes mortars and concretes varying widely in consistency, which are therefore in no sense comparable on the basis of strength.

(d) A normal sand may be regraded and so increased in fineness as to double the surface area and yet produce a concrete, with the same cement content and flowability, equal in strength to the mixture containing the normally graded sand having one-half the surface area.

(e) Not only the grading of a sand, but the relative quantity of sand in the mix may vary within wide limits without lowering compressive strength.

(f) It is quite evident that the author of this theory had no means of measuring and controlling consistency, since reproduction of the mortars and concretes used in his work varied widely in this respect and showed equally wide variations in compressive strength, although it was stated that the water formula would insure equal consistencies and equal strengths would be attained.

Water-Cement Ratio Theory of Proportioning Concrete

This theory†† has been developed and given prominence by the Lewis Institute Laboratory of the Portland Cement Association and has furnished the basis of a number of papers given to the various Branches of *The Institute*. This theory assumes that strength of concrete is dependent upon the ratio of the volume of mixing water to the volume of cement in the mix so long as the concrete is plastic and workable. It is further claimed that aggregates having the same fineness modulus will require the same quantity of mixing water to result in the same consistency or flowability when cement contents are equal. Quantity of mixing water which it is stated will result in any desired consistency may be computed from a water formula which involves the factors of cement content, fineness modulus and absorption of aggregate, and a constant water-cement ratio will result for all aggregates having the same fineness modulus.

This water formula, however, is based upon the same erroneous assumption as is the one proposed for the surface area theory of proportioning. It provides sufficient water to bring the neat cement pastes in the mixture to the same consistency, but does not make allowance for the varying water requirements of the aggregates which

††Bulletin No. 1, Lewis Institute, Chicago.

for the same fineness modulus may vary as much as 600 per cent in surface area or fineness. The resulting concretes are not comparable owing to the wide variations in consistency. To add more water to the drier consistencies, so that they may be made comparable, results in the loss of the constant w/c relation, which is the foundation upon which the theory has been built, and which is the assumed criterion for equal strengths. Tests* show that, (1) the proposed water formula does not result in comparable concretes having the same consistency, and (2) even though the fundamental requirement that concretes must have the same consistency be waived, concretes prepared in this manner with a constant w/c may vary widely in compressive strength.

A full description of the water-cement ratio theory of proportioning concrete is contained in Lewis Institute Bulletin No. 1, issued in 1919, entitled, "Design of Concrete Mixtures". Test data which is intended to prove the correctness of the theory is given in table 2, in which are shown twenty-seven different aggregate gradings, having the same fineness modulus 6.04, and each of which when combined in a 1–5 volume concrete is claimed to have the same consistency when equal quantities of mixing water are employed. Figures are also given which show that the surface area of aggregate per pound of cement varied from 390 to 1,992, or more than 500 per cent, which indicates the wide variation in gradings which may be had with the same fineness modulus.

Tests* in other laboratories have demonstrated that the above claims are not true. These gradings were carefully duplicated and it was found that wide differences in consistency resulted both as measured by the slump test and also by the flow table. Some concretes were so stiff that the slump was zero, and the wet unsupported mass could be picked up in the hands and carried back to the mixer without losing its shape, while other mixtures were almost soupy in consistency. Even though such wide consistency differences do not permit of fair strength comparisons, compression test pieces were molded from each and the strengths at twenty-eight days were found to vary more than 30 per cent. The addition of more water to the dry or less water to the wetter mixtures, to result in the same consistency, of course destroys the constant water-cement ratio which is the basis of the theory of proportioning. Such results as were found, when these gradings were duplicated, clearly show that not even the slump test, inaccurate as it is, was employed to determine the consistency of the different mixtures which are included to prove the correctness of the theory.

The wide publicity which has been given to this theory has been of some benefit in that it has emphasized the injurious effect of excess mixing water beyond that amount required to produce a mixture having the minimum flowability required for the work at hand. However, contrary to the impression held by some, this effect of excess water is not an essential element in the proportioning theory advanced nor was this injurious effect discovered in working out this theory. That excess of water will reduce compressive strength has long been known to engineers who have been familiar with laboratory investigations of concrete and warnings that mixing water should always be held to a minimum have been given in earlier publications.†

*Engineering News-Record, June 12, and August 14, 1919. Proceedings A.S.T.M., Vol. XIX, pages 485 and 502.

†Technologic Paper 58, Bureau of Standards.

If the water-cement ratio theory of proportioning were correct we would be unable to use sands such as beach sands, or use "oversanded mixtures" without considerably reducing compressive strength. Yet tests show that fine sands, as well as excess of sand, in the mix, within rather wide limits, do not lower strength, and on the other hand furnish concretes having superior working qualities due to their small tendency to segregate in the wetter consistencies which must often be employed. Practice has also shown that even were the theory correct in principle it is impracticable to specify water-cement ratios which must be employed for different types and gradings of aggregates without previous experience with the same materials. As stated above, fineness modulus is not a criterion of the water requirement of an aggregate since this factor does not include surface area. However much or little water it is hoped can be added to a batch of concrete, the actual amount which must be used is established by the conditions on the work such as shape of forms, reinforcing steel, cement content, aggregate quantity and grading including its surface area, and not by cement content and fineness modulus alone.

Both the surface area and water-cement ratio theories of proportioning are fully discredited by a consideration of the very test data which the authors have advanced to support their respective theories, since sound principles of testing were violated in obtaining their test results. Had proper testing methods been employed in both laboratories and had proper appreciation of the fundamentals, which cannot be disregarded in testing work, been existent, there seems to be little doubt that these theories would never have been presented to the public.

While the discussion of both theories has done much to focus the attention of engineers on the feature of concrete proportioning, which is worthy of far more attention than has been accorded it in the past, both have failed to furnish the engineer with that much desired formula or equation which will permit specifying in advance quantities of materials to result in concrete of definite quality. After consideration of what has been brought out along such lines during the past few years it seems quite safe to say that such a short cut, for universal application, will not be found, but that the desired standard of concrete quality can be obtained and maintained only by co-operation between the testing laboratory and the field engineer, coupled with observation and experience. A little work properly planned will permit the determination of the approximate concrete making qualities of aggregates from our main sources of supply and a proper system of inspection and testing on all work of importance will permit of such modifications as are needed from time to time to correct for variations in cement and aggregate quality as well as other factors beyond control, which tend to effect the strength of concrete. For aggregates and cements in use in any locality from year to year there is no reason why fairly accurate combinations cannot be tabulated to produce concrete of any desired quality under known conditions. Experience and field tests will soon indicate the importance of the other variable factors which tend to influence quality and point out changes in proportions which must be made at times. Concrete, owing to its method of production will never be as uniform in quality as some other types of materials but there are no reasons apparent why many of the uncertainties now involved cannot be completely eliminated.

Professional Meeting 1922

Winnipeg: September fifth, sixth and seventh.

General Professional Meeting Programme.

Those who have enjoyed the hospitality of the Winnipeg Branch are fully aware that they are masters of the art of entertaining their guests in a manner that does them credit. A glance through the programme of the general professional meeting of *The Institute* to be held at Winnipeg, September fifth, sixth and seventh, with headquarters at the Fort Garry hotel, will show complete arrangements for a gathering well balanced between professional sessions and social functions. Every engineer in Canada is interested in the great work being done in the neighbourhood of Winnipeg in hydro-electric development, and those who attend will have ample opportunity of inspecting these works as well as listening to papers descriptive of their details. Wednesday is given up entirely to excursions, visits to the plants of the Manitoba Power Company and the Winnipeg Hydro System, the visitors being guests of the Manitoba Power Company at luncheon and the Winnipeg Hydro System for dinner. Thursday's sessions include a civil section and a geological section in the morning and a civil section and a mechanical section in the afternoon. As shown by the titles and the names of the authors an interesting technical programme is promised.

Programme of the General Professional Meeting of The Engineering Institute of Canada, Winnipeg, September 5th, 6th, and 7th, 1922.

Headquarters, Fort Garry Hotel.

TUESDAY, SEPT. 5th.

9.00 a.m.—Registration.
10.30 a.m.—Opening Addresses.
11.15 a.m.—Discussion on Institute Affairs.
12.30 p.m.—Luncheon at the Fort Garry, provided by the Associatio of Professional Engineers of the Province of Manitoba
2.30 p.m.—Extensions to the Hydro-Electric System of the City o Winnipeg, by E. V. Caton, M.E.I.C.
3.30 p.m.—Manitoba Power Company's Development at Great Falls by F. H. Martin, M.E.I.C.
6.30 p.m.—A dinner given by the Winnipeg Branch at the Moto Country Club, Lower Fort Garry.

WEDNESDAY, SEPT. 6th.

Excursion to Great Falls and Point du Bois, visiting th power plant of the Manitoba Power Company, an that of the City of Winnipeg.
8.00 a.m.—Train leaves the C.P.R. station, arriving at Great Fall at 11.00 a.m.
11.15 a.m.—Luncheon will be served by the Manitoba Power Company
12.00 noon—Inspection of the work and plant.
2.00 p.m.—Leave Great Falls, arriving at Point du Bois at 4.30 p.m
4.30 p.m.—Inspection of the power plant.
6.30 p.m.—Dinner will be served by the Winnipeg Hydro System.
7.45 p.m.—Leave Point du Bois, arriving in Winnipeg at 11.00 p.m.

THURSDAY, SEPT. 7th.

Civil Section

9.30 a.m.—Improvements to Moncton Yard and Engine Facilitie by S. B. Wass, A.M.E.I.C.
10.45 a.m.—Automatic Box Car Unloaders for Grain, by Fred. Newel A.M.E.I.C.

Geological Section

9.30 a.m.—Fuel Values of Alberta Coals, by G. R. Pratt, A.M.E.I.
10.45 a.m.—The Geology of the Mackenzie Basin, by S. E. Slippe
1.00 p.m.—Luncheon at the Assiniboine Park under the auspices the City of Winnipeg.

Civil Section

3.00 p.m.—Considerations of a Road Policy, by M. A. Lyons. A.M.E.I.C.

4.15 p.m.—The Chemistry of Portland Cement and its Disintegration by Alkaline Ground Waters, by Prof. T. Thorvaldson.

Mechanical Section

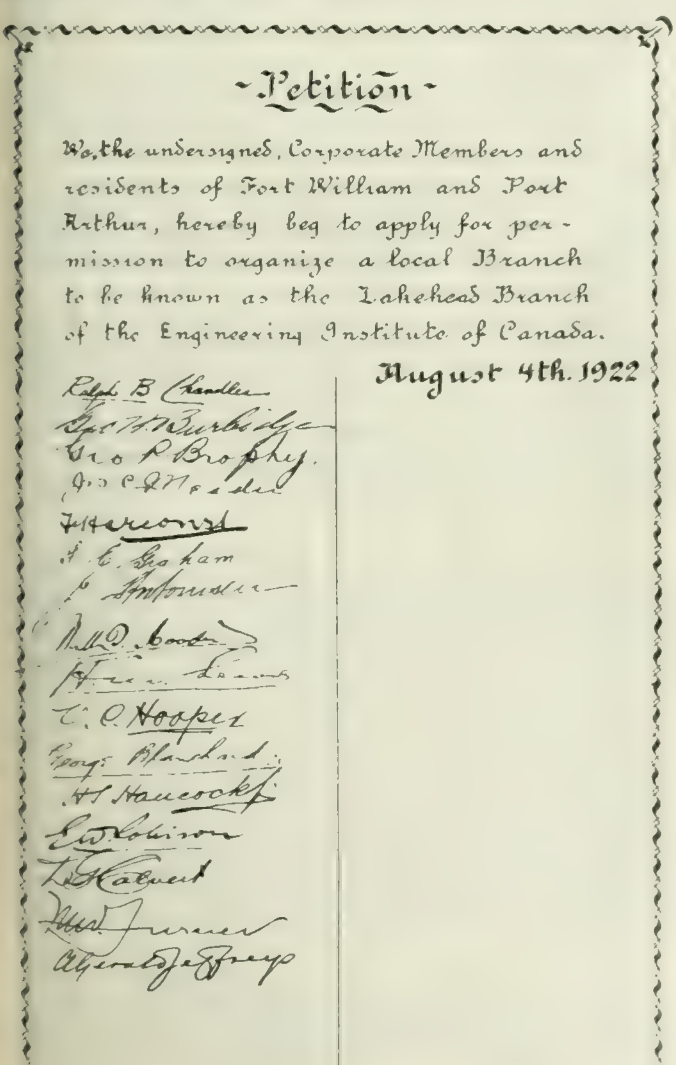
3.00 p.m.—Turbines for the Great Falls Development of the Manitoba Power Company, by H. S. Van Patter, A.M.E.I.C.

8.30 p.m.—Banquet at the Fort Garry Hotel.

The Lakehead Branch

The most recent engineering centre to anticipate organizing is Fort William and Port Arthur, a petition having been received through George H. Burbidge, M.E.I.C. at the last meeting of Council, to form a Branch to be known as the Lakehead Branch of *The Engineering Institute of Canada*. This petition was unanimously approved,and the organization meeting will be held immediately after the general professional meeting at Winnipeg.

As the form in which the petition was received showed unique preparation, and inasmuch as it will be of historic interest, it is reproduced herewith, the names of the signatories being easily recognized.



~Petition~

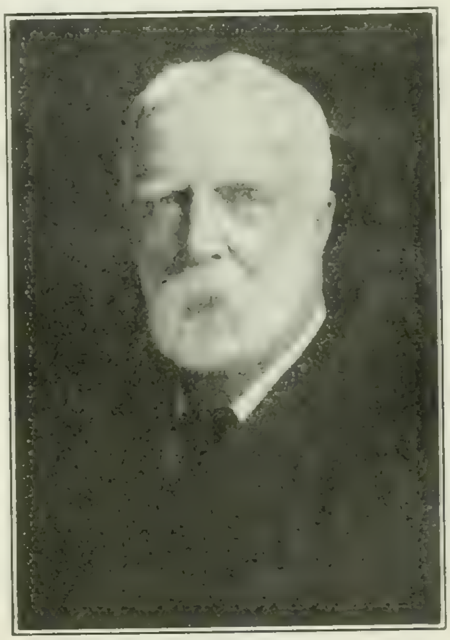
We, the undersigned, Corporate Members and residents of Fort William and Port Arthur, hereby beg to apply for permission to organize a local Branch to be known as the Lakehead Branch of the Engineering Institute of Canada.

August 4th. 1922

Ralph B Chandler
Geo H Burbidge
Geo P Brophy
C. O. Hooper
H Hancock

Unique Tribute to H. J. Cambie, M.E.I.C.

H. J. Cambie, M.E.I.C., for five years, 1892, 1896, 1901, 1904 and 1910, councillor of *The Institute*, in the days of the Canadian Society of Civil Engineers, was honoured by his fellow members of the Vancouver Pioneers Association, when at a meeting in Vancouver on August 14th, 1922, the members of the Association crowded the Eagles Hall to do honour to that grand old pioneer whose guiding hand and far-seeing vision was so largely responsible for making the shores of Burrard Inlet the terminus of a mighty railway. The old friends and associates of Mr. Cambie, who had been unanimously chosen at a previous meeting to be the first recipient of the medal to be annually presented by the Hudson's Bay Company, were there in full force and many were the kind words said regarding his past work in building up the city of which all are now so proud.



H. J. CAMBIE, M.E.I.C.

Unanimous choice of Vancouver Pioneers for First Hudson's Bay Company's Medal.

The presentation was made by H. T. Lockyer, general manager of the Hudson's Bay Company, on behalf of the company and the association. The speaker said that he entirely agreed with the unanimous view of the members that no recipient could have been selected more worthy of the honour. The medal, although not so large that it would take an express wagon to take it home, nor half good enough for the recipient, carried with it the sincere honour, respect and kindliest wishes of the company and the association. Mr. Cambie, through a long life, had earned the gratitude not only of British Columbia, but of the Dominion as a whole.

Mrs. Lockyer, amid cheers and the singing of "He's a Jolly Good Fellow." gracefully pinned the gold medal, engraved with the crest of the association and a suitable inscription, upon Mr. Cambie.

In returning thanks for the honour, Mr. Cambie was visibly affected, as were many in the audience. His

protest that many were worthier than he was met with loud cries of "No, no!"

"I may never address you again," he continued, "and I wish to express to the many friends here, whom I have met in different parts of the province during my long career, the deep sense of gratitude I feel for their good wishes, and for the great compliment they have paid me."

Mr. Cambie gave a short synopsis of his connection with Vancouver, the site of which he had first visited in 1874, coming by coach from New Westminster through the bush. He had lived here for thirty-seven years and he felt that this crowning event in his life was a proof that a prophet might have honour even in his own country. He concluded by saying that he had never made a real speech in his life and begged to be excused from attempting the feat at 86 years of age.

Mayor Tisdall paid tribute to one who had been largely instrumental in forging one of the great links of the Empire. The surmounting of the canyons of the Fraser had made for those great engineers a monument which would endure for all time. Mr. Cambie's life work had left an example for the youth of the country.

Mr. George Gordon, among other kindly things, emphasized the fact that Mr. Cambie had never been known to say an unkind word about others, nor, so far as he knew, had any unkind words been ever said of him. He possessed the esteem, love and respect of everyone in the community. Had he ever offered himself for public office he would hardly have had a vote against him.

Mr. Cambie was elected a member of the Canadian Society of Civil Engineers in 1888. His work on railway location, construction, and maintenance, from the time he entered the office of W. Walter Shanly in 1852, until he retired from the position of chief engineer of the Esquimalt and Nanaimo Railway, is recorded in the June 1920, issue of *The Journal.*

PERSONALS

D. W. Houston, A.M.E.I.C., has been elected to the Executive of the Canadian Electrical Railway Society, as Saskatchewan representative.

W. S. Gould, B.Sc., S.E.I.C. McGill University '22 is at present with the Abitibi Power and Paper Company at Iroquois Falls, Ontario.

H. Chantler, B.A.Sc., S.E.I.C. University of Toronto '22, has taken a position with the Malt Products Company of Canada, Ltd., at Guelph, Ontario.

A. A. Turnbull, Jr.E.I.C., is now connected with the New Brunswick Telephone Company, St. John, N.B., in their plant department.

J. H. Bradley, A.M.E.I.C., has accepted a position with the Canadian Bridge Company, at Walkerville, Ontario.

E. D. McIntosh, A.M.E.I.C., is engaged on road construction with the Provincial Highways Board, Ontario, and is located in Kent County.

Thomas S. Scott, M.E.I.C., who for some years has been on the staff of Queen's University, has been appointed city engineer for the city of Niagara Falls, Ontario.

J. A. L. Waddell, D.Sc., LL.D., M.E.I.C., received the high distinction of being elected on June 30th last, a Member of the Royal Academy of Sciences and Arts of Barcelona, Spain, (Real Academái de Ciencias y Artes).

W. N. Ryerson, M.E.I.C., until recently general manager of the Great Northern Power Company, at Duluth, Minn., is now with Day and Simmerman, Inc., at 611 Chestnut Street, Philadelphia, Pa.

Geo. F. Binns, S.E.I.C., is now with Peter Lyall and Sons Construction Co., as engineer on the constructior of the Royal George School, Notre Dame de Grace Montreal, Que.

A. G. Tweedie, A.M.E.I.C., of Sault Ste. Marie, Ontaric is fulfilling a contract for the construction of a concret dam on the Black river near Waltham, Quebec for th Pembroke Electric Light Co., of Pembroke, Ontario.

E. L. Zealand, S.E.I.C., of Hamilton, Ont., is concret inspector and instrumentman on the Bruce Division o the Canadian Pacific Railway and is at present locatec at Erin, Ontario.

H. E. Meadd, S.E.I.C., has accepted a position witl the Fort Francis Pulp and Paper Company Ltd., at For Francis, Ontario, and is engaged on paper mill design fo the company.

Kennington H. S. Hague, A.M.E.I.C., of Montreal, ha recently joined the sales staff of the Banking Servic Corporation in Montreal. Mr. Hague is a graduate o McGill of the class of 1914.

J. A. Loy, Jr.E.I.C., formerly inspector with Depart ment of Public Highways of Ontario, is now engaged o location surveys for the James Bay extension of th T. & N.O. Ry.

J. A. Hamilton Henderson, Jr.E.I.C., who graduate this spring from Queen's University, is continuing hi work in British Columbia as assistant geodetic enginee with the Geodetic Survey of Canada.

M. W. Turner, A.M.E.I.C., has been appointed supe intendent of construction in charge of the constructio of a two-machine paper mill for the Fort William Pap Company, Ltd., at Fort William, Ontario. Mr. Turn was formerly assistant engineer of the above company.

A. A. Richardson, A.M.E.I.C., formerly of Pete borough, Ontario, is now situated in Three Rivers, Que on the engineering staff of the Thompson Starrett Compan in connection with the construction of the new pulp an paper mill for the St. Lawrence Paper Mills Ltd.

John R. Montague, A.M.E.I.C., formerly with D. (Loomis and Sons of Montreal, has accepted the position personal assistant to H. G. Acres, M.E.I.C., chief hydraul engineer of the Hydro-Electric Power Commission Ontario.

Noël F. Harrison, A.M.E.I.C., of the Manitoba Pow Company, Ltd., engineering department, Winnipeg, is present on an extended visit to Ireland. Being interest in the development of peat-gas-power, he will stuc conditions there.

Lt.-Col. A. C. Garner, D.S.O., M.E.I.C., was elected a Fellow of the Royal Geographical Association in June. Col. Garner has over thirty years of residence in Western Canada to his credit, and has always taken a keen and practical interest in the development of the Dominion.

W. E. Longworthy, A.M.E.I.C., who following his return from the war has been in the employ of the City Engineer's Department at Regina, is vacating his post on August 21st, and has accepted a position with the Imperial Oil Company, Ltd., at Regina.

W. W. Perrie, A.M.E.I.C., of Saskatoon who has been engineer in charge of Federal Aid Road Work, for the Provincial Government, has accepted a position in the City Engineer's Department, Regina.

M. D. Stewart, S.E.I.C., has been appointed as purchasing agent with the firm of Bremner, Norris and Company, Ltd., and is located in Montreal. Mr. Stewart graduated in civil engineering from the University of Toronto this year, having specialized in hydraulic work during his final year.

M. P. Whelen, S.E.I.C., of Toronto, is now with the Power Sales Department of the Toronto Hydro-Electric System. Mr. Whelen who graduated in engineering from McGill University in 1921 was awarded the degree of M.A.Sc., at the last convocation of the University of Toronto, for research work on electric heating.

Kenneth B. Seely, Jr.E.I.C., has been appointed to the engineering staff of the Canadian General Electric Company, Ltd., at Peterborough, Ontario. Following graduation from the University of New Brunswick in 1920, Mr. Seely became associated with this company by taking the students engineering course which it offers.

P. A. Landry, A.M.E.I.C., has been appointed to the staff of W. J. Westaway and Company, McGill Building, Montreal. Prior to enlisting he had been land surveying in British Columbia for a number of years having been admitted to practise as a B.C.L.S. in 1909. Mr. Landry is an arts graduate of the University of St. Joseph, N.B., of the class of 1899 and a science graduate of McGill University in 1903.

R. B. Young, A.M.E.I.C., was elected secretary of Committee C-1 on Cement of the American Society for Testing Materials at the recent annual meeting held at Atlantic City, N.J. Mr. Young has been with the Hydro-Electric Power Commission of Ontario since graduating in 1913 and is now senior assistant laboratory engineer at the Engineering Materials Laboratories of the Commission.

C. Ben Bate, A.M.E.I.C., formerly of the engineering staff on the construction of the additions to the Hawkesbury mill of the Riordon Company, Limited, and more recently engineer on the construction of roads in the vicinity of Hawkesbury, has accepted the position of assistant engineer with Kerry and Chace, Ltd., and will be located near Pushthrough, Newfoundland, in connection with power investigation in that district.

F. L. Wanklyn, M.E.I.C., of Montreal, has been appointed one of the fuel controllers for the province of Quebec. Mr. Wanklyn is general executive assistant of the Canadian Pacific Railway. He is one of the Institute's earliest members having been connected with it since January 20, 1887. He was elected councillor in 1909.

G. R. Pratt, A.M.E.I.C., has been appointed fuel engineer for the Government of the Province of Alberta. In 1911 Mr. Pratt accepted the position of mechanical and fuel engineer with the Canadian Pacific Railway for the Western Lines and has occupied that position up to the time he received his recent appointment. Mr. Pratt has been with the Canadian Pacific Railway Company since 1906, having joined the construction staff at the Winnipeg shops in that year.

Dr. John S. Bates, A.M.E.I.C., of Bathurst, N.B. was elected president of the Canadian Institute of Chemistry, at the convention held in Ottawa this summer. Dr. Bates received his degrees of B.A. and B.S., from Acadia University in 1904 and 1909 respectively, and Chem. E., and Ph. D., from Columbia University in 1909 and 1913. He was for some time superintendent of the Forests Products Laboratories of Canada, and later joined the staff of Price Bros. and Company Ltd., at Kenogami, from which he resigned to accept his present position with the Bathurst Lumber Company.

H. Aldous, Jr.E.I.C., has recently accepted a position on the engineering staff of the Jackson Lewis Company, Ltd., engineers and contractors, Toronto. Mr. Aldous graduated in 1915 from London College of Municipal and Sanitary Engineering and is an Associate Member Institution of Sanitary Engineers, a Member Royal Sanitary Institute, and a Fellow Royal Meteorological Society. Following four years on active service, Mr. Aldous spent two years on public works in Norwich, England, coming to this country in 1921 to join the staff of the Department of Public Highways of the province of Ontario.

E. V. Caton, M.E.I.C., until recently chief engineer of the city of Winnipeg Light and Power Department has recently accepted the position of chief engineer of the Winnipeg Electric Railway Company. Mr. Caton was born at Brighton, England and received his early education at the grammar and technical schools of Brighton. His first work in the Winnipeg district was in charge of the erection of the electrical plant for the city of Winnipeg in 1911 and 1912 and in June 1912 he was appointed to the position which he has held until recently. In this issue of *The Journal* appears a paper in which Mr. Caton has described the extensions to the hydro-electric plant over which he has had charge for the past ten years.

J. E. Porter, A.M.E.I.C., formerly secretary-treasurer of the Border Cities Branch, is now located at Ford, Ontario, and is associated with the Engineering Department of the Ford Motor Company in charge of the civil engineering branch of the proposed extensions. Before receiving his degree of B.A.Sc., from the University of Toronto in 1915, he was engaged on maintenance work with the Algoma Central Railway for two years and as instrumentman with the Public Works Department for one year. His connection with this department was continued after graduation until 1918 as assistant engineer of the district of Western Ontario, following which he was appointed field engineer with the Canadian Steel Corporation Ltd., at Ojibway, Ontario, which position he held until he received his present appointment.

C. A. MAGRATH, M.E.I.C.

Appointed Member of Fuel Committee of Canada

C. A. Magrath, M.E.I.C., who is widely known in connection with his many activities of national importance has been appointed by the Federal Government a member of the Fuel Committee of Canada to advise on all questions which might arise out of the present fuel-supply situation resulting from the prolonged strikes. In this capacity, Mr. Magrath's services will be of great value to the country since his thorough knowledge of this important subject, as demonstrated during his tenure of office as fuel controller, in the winters of 1917 and 1918 when the last crisis in the supply of fuel occurred, is of vital importance in guiding the policy to be adopted in the present instance. Among the more important posts held by Mr. Magrath within the past ten years is that of member of the International Joint Commission to which he was appointed in 1911 and of which he became chairman in

C. A. MAGRATH, M.E.I.C.

1915, succeeding the Hon. T. Chas. Casgrain. In 1878 he engaged in irrigation and other development work in Northern Alberta. He represented Lethbridge in the North-west Assembly for several years, finally becoming a member in the Haultain Cabinet and later in 1908 represented Medicine Hat constituency in the House of Commons. He was appointed chairman of a commission created by the Government of Ontario in July 1913, to report upon a scheme for the construction, improvement and maintenance of the public roads and highways of the province of Ontario; which report was dated March, 1914. Following his final report as fuel controller in March 1919, he became a member of the Honorary Advisory Council on Highway Construction in connection with the administration of the Canada Highways Act and financial assistance to the provinces thereunder. In November 1921, he was appointed by the Government of Alberta, chairman of the South Alberta Survey Board, which was to look into certain questions respecting the development of the southern part of the province, and which reported the same year. The diversity of Mr. Magrath's activities is illustrated by the fact that he has been a member of the Executive Council of the Victorian Order of Nurses for some years and at the last annual meeting was elected president, and also an active member of the Patriotic Fund Committee since its formation.

EMPLOYMENT BUREAU
AND
MEMBERS' EXCHANGE

To make this department more valuable it is proposed that in future advertisements of situations vacant should state salary, and give details of requirements.

Situations Wanted

Civil Engineer

Civil engineer, eleven years experience in railway surveying, location and maintenance, A.M.E.I.C., 29 years of age, desires position, available now. Apply Box 115-P.

Chemical Engineer

Recent graduate in chemical engineering, McGill, desires position which offers a chance of advancement. Past experience in machine shop work. Apply Box No 112-P.

Civil Engineer

Civil engineer, A.M.E.I.C., age 30 years, married, three years on active service with rank of Captain, desires to engage with contracting firm, firm of consulting engineers or municipality. Experienced in railroad construction surveying, concrete bridge construction, highway construction, water supply and sewerage systems, past four years and at present, city engineer small city of 10,000 population. Desiring a change of location, am open for engagement. References on request. Apply Box No 110-P.

Civil Engineer

Position desired on survey or construction work by civil engineer with ten years experience in draughting instrument work, automatic signalling, interlocking maintenance of way, construction, structural and hydro electric development. Apply Box No. 111-P.

Mechanical and Structural Engineer

Recent graduate, age 26, married, good on organization and detail, wants employment on live mechanical or structural work. Training includes experience and special study on power (steam, hydraulic, and electric and combustion engineering. Can report immediately detailed information as to education, experience, and references, on application to Box No. 113-P.

Structural Engineer

Graduate of McGill University, A.M.E.I.C. 191- desires position on structural engineering, preferably a

resident engineer for some industrial firm. Experience on municipal work, building foundations and assistant resident engineer for a large steel company in Canada. Salary expected $300. per month. Apply Box No. 114.-P.

Situations Vacant

Sales Engineer

First class sales engineer to handle a high grade specialty, having sales ability and engineering knowledge, and capable of sustained sales effort. Executive ability would be advantage, and would open up for rapid advancement. Location Toronto. Apply Box 217.

Sales Engineer

Engineering salesman to handle building materials in the Montreal district. Applicant must be able to speak French. Apply Box 218.

Chemist (for Investigational Work with Soils and Fertilizers), Experimental Farms Branch, Department of Agriculture Ottawa.

4398. A Chemist (for Investigation Work with Soils and Fertilizers), Experimental Farms Branch, Department of Agriculture, Ottawa, at an initial salary of $2,700 per annum, which will be increased upon recommendation for efficient service at the rate of $120 per annum until a maximum of $3,180 has been reached.

Duties:— To direct and control, under the guidance of the Dominion Chemist, investigational work with soils, fertilizers, soil amendments, and crop nutrition in general, including the working out of detailed plans of research and experiment, the supervision of the field work connected with these, and also the laboratory investigations and analyses required; to prepare reports and bulletins on the results obtained; to give addresses on questions relating generally to soils and fertilizers; to conduct the necessary correspondence and to perform other related work as required.

Qualifications:— Graduation in science from a university or agricultural college of recognized standing: at least three years of post-graduate experience in plot control and allied work; research ability; supervisory ability.

Examination:— A rating on education and experience will be given from the sworn statements submitted by applicants on their application forms. To those who qualify, an oral examination may be given, if necessary.

Senior Quantity Surveyor

4399. A Senior Quantity Surveyor, Chief Architect's Branch, Department of Public Works, Ottawa, at an initial salary of $1,680 per annum, which will be increased upon recommendation for efficient service at the rate of $120 per annum, until a maximum of $2,040 has been reached. This initial salary will be supplemented by whatever bonus may be provided by law.

Duties:— Under direction, to prepare bills of quantities of materials and estimates of costs from construction plans; to check estimates and bills of quantities submitted by architects outside the Chief Architect's office, and those contained in tenders for proposed construction; to deduce and keep a record of unit prices; to design forms and compile statements; in some cases to direct the work of others engaged in similar work; and to perform other related work as required.

Qualifications:— Education equivalent to high school graduation; either graduation in architecture from a school of applied science of recognized standing with two years of experience in an architect's office, or four years of experience in an architect's office; familiarity with costs of materials; ability to prepare and interpret architectural plans and to estimate quantities of materials; ability to direct the work of others. While a definite age limit has not been fixed for this competition, age may be a determining factor when making a selection.

Examination:— A rating on education and experience will be given from the sworn statements submitted by applicants on their application forms. To those who qualify, an oral examination may be given, if necessary.

Pulp and Paper Specialist

For the following position preference in appointment will be given to residents of the districts where the vacancy occurs.

4401. A Pulp and Paper Specialist, Forest Products Laboratories, Montreal, Que., Department of the Interior, at an initial salary of $3,120 per annum, which will be increased upon recommendation for efficient service at the rate of $120 per annum, until a maximum of $3,600 has been reached.

Duties:— Under direction of the Superintendent of Forest Products Laboratories to plan and supervise the work of the Pulp and Paper Division of the Laboratories; to conduct research work relating to the chemistry of wood as applied to the manufacture of pulp and paper; to conduct experimental work relating to the chemical processes for treating wood commercially; to conduct special investigations relating to wood; to prepare reports and perform other related work as required.

Qualifications:— Education equivalent to graduation in science from a university of recognized standing, preferably with specialization in chemistry or chemical engineering; at least four years' experience after graduation, in research work relating to pulp and paper or in the manufacture of pulp and paper; wide knowledge of the technology of pulp and paper and of their industrial utilization; some knowledge of office practice; executive ability.

Examinations:— A rating on education and experience will be given from the sworn statements submitted by ppalicants on their application forms. To those who qualify, an oral examination may be given, if necessary.

General Directions

According to law a special preference is given first, to candidates who are in receipt of a pension on account of disability received as a result of war service and who have not been successfully re-established and secondly, to candidates who have been on active service overseas and who are found to possess the minimum qualifications for the position. The age limit does not apply to such candidates.

Application forms properly filled in must be filed in the office of the Civil Service Commission not later than September 14th, except in the case of Competition No. 4401 for which the time limit will be October 3rd. Application forms may be obtained from the offices of the Employment Service of Canada, from the Postmasters at Prince Rupert, Vancouver, Victoria, Edmonton, Calgary, Regina, Winnipeg, Quebec, Charlottetown Halifax, Fredericton, and St. John, or from the Secretary of the Civil Service Commission.

By order of the Commission,

W. Foran,

Secretary.

Members' Exchange

Back Numbers of The Engineering Journal Wanted

Several requests have recently been received for various numbers of Volume No. 1, 1918 of *The Engineering Journal.* Enquiries for Volume 2, No. 3, (March 1919), and Volume 3, No. 12, (December 1920) have also been received. As these are now out of print, any extra copies of the above issues which the members may wish to forward to the Secretary will be appreciated.

BRANCH NEWS

Calgary Branch

J. A. Spreckley, A.M.E.I.C., Secretary.
Floyd K. Beach, A.M.E.I.C., Branch News-Editor.

His Excellency the Governor General of Canada, and party, during their visit to Calgary and the vicinity, early in July, were taken over the eastern section of the Canadian Pacific Railway irrigation system, by A. S. Dawson, M.E.I.C., chief engineer of the Department of Natural Resources, C.P.R. The party visited Bassano dam, Brooks aqueduct, and other important structures on the project, and much interest was shown in these works and in the agricultural development resulting therefrom.

Irrigation Convention

There was a record attendance of 375 delegates and visitors at the annual convention of the Western Canada Irrigation Association, held at Maple Creek and Brooks from July 26th to 29th. Although most of the visitors were farmers from the two localities there was a good representation of engineers. Those from the Calgary Branch included Messrs. A. S. Dawson, M.E.I.C., W. Pearce, M.E.I.C., R. S. Stockton, M.E.I.C., F. E. Emery, A.M.E.I.C., P. A. Fetterley, A.M.E.I.C., M. H. French, A.M.E.I.C., W. B. Hutcheson, A.M.E.I.C., V. Meek, A.M.E.I.C., G. H. Patrick, A.M.E.I.C., C. A. Pope, A.M.E.I.C., B. Russell, A.M.E.I.C., W. H. Snelson, A.M.E.I.C., J. A. Spreckley, A.M.E.I.C., G. H. Whyte, A.M.E.I.C., H. J. McLean, Jr.E.I.C., and C. Errington, Jr.E.I.C.

Good publicity was given the convention in the press and a number of the addresses were reproduced in full. The Alberta Association of Professional Engineers was officially represented by three delegates.

Owing to the absence in the field of a large portion of the membership no meetings of the Branch were held in July.

Cape Breton Branch

Kenneth G. Cameron, A.M.E.I.C., Secretary-Treasurer.

Summer Outing

The members of the Branch, temporarily setting aside their multitudinous cares and worries, paid a visit on Saturday, August 5th to Louisburg and Sangaree. Leaving Sydney about noon, by automobile, they arrived in Louisburg in time for lunch and, thanks to the twenty-four-mile drive, very much in need of it. Lunch was provided by the parents of the Boy Scouts, in aid of that body, and was excellent in itself and very much enjoyed. About thirty members sat down, together with Mayor Martell of Louisburg, Archdeacon T. Fraser Draper, and six members of the staff of the Marconi transatlantic wireless station, including Mr. J. W. Mullins, manager of that company's Cape Breton operations,

CAPE BRETON BRANCH

VISIT TO LOUISBURG & SANGAREE

– AUG 5TH 1922 –

MARSHALL:
A.W MACMASTER

COMMITTEE
K H MARSH, H LONGLEY, C C CURTIS,
D S MORRISON, S C MIFFLEN
[THE COMMITTEE WILL REFEREE ALL DISPUTES]

"............ LET ME PLAY THE FOOL
WITH MIRTH AND LAUGHTER LET OLD WRINKLES COME,
WHY SHOULD A MAN WHOSE BLOOD RUNS WARM WITHIN
SIT LIKE HIS GRANDSIRE – CUT IN ALABASTER?"

ORDERS FOR THE DAY

11 30 am D S Time	Assemble at the Institute Rooms - Bank of Commerce Bldg, Sydney – Cars to be parked on Esplanade – Marching orders and equipment will be issued, and all contraband goods confiscated
12 00 noon	PROMPT – leave Sydney – car owners will convey other members, – drivers are urgently requested to keep within sight, not to pass each other, and not to exceed 50 m.p.h. as the road is not asphalted all the way
12 15 pm Std Time	Arrive Louisburg, and proceed to Parish Hall
12 30 pm	Lunch in Parish Hall – Chairman – Mr K H MARSH. After lunch the chairman will introduce Mr A A MARTELL, Mayor of Louisburg, Archdeacon DRAPER, and guests from the Marconi Station.
2 00 pm	Visit to the Ruins of the Fortifications – under guidance of Archdeacon DRAPER
3 30 pm	Visit to Station of Canadian Marconi Wireless Telegraph Co, – tour of inspection and address on Wireless Telegraphy by Mr F A SMITH – Acting Resident Engineer
5 30 pm	Leave for SANGAREE
6 00 pm	Dinner at KAMP KILL KARE – SANGAREE – Chairman – Mr K H MARSH [Make a joyful noise but remember that discretion is the better part of valour]
7.30 pm	Leave for SYDNEY – arriving about 9.45 pm D S Time

Only those members will be conveyed home, who can say – clearly, distinctly, and whole-heartedly –

"THE ENGINEERING INSTITUTE STEADILY STRIVES TO STIMULATE STRICTER STANDARDS"

Following lunch, the chairman, K. H. Marsh, M.E.I.C., introduced Mayor Martell, who extended a most hearty welcome to the company, both individually and as representative of the engineering profession, from whom, he said, one could always be sure of a warmer welcome and a heartier handshake than from any other people. The appearance of an engineer in any locality, he said, was always looked upon as the forerunner of development or activity of some description, and he felt that, although the company was on a pleasure, rather than a business expedition, still one might expect boundless possibilities from such an aggregation of engineering talent.

The chairman then introduced Archdeacon Draper, who had only that week celebrated the fortieth anniversary of his service in Louisburg. Mr. Draper endorsed the Mayor's welcome, mentioning particularly his friend and our chairman, C. M. Odell, M.E.I.C. He outlined the possibilities of development in Louisburg, — the oldest harbour

on the east coast of America, spoke of the early activities when the town was founded, and briefly outlined the history of the military founding and occupation of the town, with which every Canadian should be familiar. Mr. Mullins and Mr. MacDonald of the wireless station, expressed their pleasure in being present, deferring further remarks until the members reached their company's headquarters. The chairman then called upon T. J. Brown, M.E.I.C., who speaking of the history of Louisburg and its direct influence on Canadian history as a whole, deplored the fact that so little interest has been taken by the governing bodies of the country in the preservation of the fortifications and the erection of an adequate permanent memorial to commemorate the events of 1745-58. It was to the lasting discredit of the Canadians, he said, that the only memorial erected was placed there through the initiative, and at the expense of the American people. He undertook to say that the Branch would endeavour to use its influence to have this manifest wrong righted.

The members then adjourned to the Old Town, where under the guidance of Archdeacon Draper, they viewed the remains of the old fortifications, erected at a cost of ten million dollars, and now a mere heap of grass covered stones. Unfortunately, fog and rain prevented the thorough inspection which members wished to make, but the visit has at least had the effect of awakening a wider interest among the party. It is but a short distance from the ruins to the transatlantic station of the Marconi Wireless Telegraph Company, at which place the members were received by the staff, and shown the inner workings of the invisible science.

Returning to the New Town, the party bade adieu to their guests, and proceeded to Kamp Kill Kare at Sangaree, stopping on the way to show their appreciation of their chairman, Mr. Odell, who had accompanied them so far, in spite of recent illness, but was now returning home. Sangaree is beautifully situated on the Mira river. After dinner, with the help of a piano, each did his extemporaneous best to surprise his neighbour, succeeding in varying measure, but on the whole, pleasantly.

Leaving at dark, the party returned through heavy rain, but though wet externally and, (comparatively), dry internally, the day was considered very successful, and it is hoped that it helped the individual member to realize that his professional associates, like the Colonel's Lady and Judy O'Grady, have a human side under their business armour.

Saskatchewan Branch

D. A. R. McCannel, A.M.E.I.C., Secretary-Treasurer.

The Papers and Library Committee are completing arrangements for the delivering of papers before the Saskatoon members, full particulars of which will be available shortly.

Members report improved conditions in engineering activities and with the prospects of a good crop, conditions at the moment look promising for next year.

Annual Summer Meeting

The Saskatchewan Branch held their annual summer meeting on July 15th, and the proceedings opened at noon with an inaugural luncheon at the C.P.R. dining hall. The business proceedings opened at 2 p.m. at the Public Library, and this was mostly of a technical nature.

H. S. Carpenter, M.E.I.C., Deputy Minister of Highways, gave an account of the proceedings of the convention of the Canadian Good Roads Association, and the professional meeting of *The Engineering Institute* both of which were held recently in British Columbia.

In the discussion that followed the reading of the papers, it was the general opinion that the good roads movement was one of the most important in the province. It was felt that the movement was about fifteen years late in starting and that this lost time must be made up, if possible.

The report of the committee on policy was read by the secretary.

Professor G. M. Williams, A.M.E.I.C., of the University of Saskatchewan read a paper on "Concrete," after which a long discussion on the subject ensued.

The evening took the form of a banquet at the C.P.R. dining hall and after the banquet had been served short addresses and musical items were given.

The chairman for the day was J. R. C. Macredie M.E.I.C., divisional engineer for the C.P.R.

The first speaker after the banquet was Colonel A. C. Garner, M.E.I.C., of Regina, who spoke of the Natural Resources of Saskatchewan.

Professor C. J. Mackenzie, M.E.I.C., of the University of Saskatchewan, spoke on "Engineering", while the other speakers included, A. E. Hamilton, James Pascoe, M.L.A., George Baker, M.L.A., and Commissioner George D. Mackie, M.E.I.C.

OTHER SOCIETIES NEWS

International Roads Congress.

A certain indication that after eight years of war and upheaval the world is beginning to return to a normal state is contained in the announcement that the International Road Congress, which ceased operations in 1914 because of the European conflict, is to resume its deliberations early next May at Seville, Spain. The program for what promises to be the greatest and most important conference on highway improvement ever held, has just been received from the office of the general secretary in Paris.

Thousands of delegates representing national and state governments and good roads associations throughout the world will participate in the congress and exchange views and experiences for mutual benefit. English, French and Spanish, have been adopted as the official languages. The first congress was held at Paris in 1908, the second at Brussels in 1910, and the third at London in 1913.

The Federated American Engineering Societies.

The weekly bulletin of The Federated American Engineering Societies has been discontinued with the issue of August 11th, 1922, and as been superseded by a monthly printed bulletin September 1, in accordance with instructions of the Executive Board issued at its meeting May 27, 1922. Arrangements are now in progress with secretaries of all local societies whereby the bulletin will be sent to their respective membership on the first Friday of each month. The bulletin will contain articles on activities of the F.A.E.S. and information of the character previously published will be given in more complete detail. A section will be devoted to the activities of member and prospective member organizations. It will also contain an editorial page. In short, the printed monthly bulletin is designed to serve the purposes fulfilled by the mimeographed weekly bulletin, but by printing it and issuing it monthly the circulation can be very much increased.

National Hydraulic Laboratories.

Hearings will begin the latter part of this month in the United States on the National Hydraulic Laboratory Bill in which the Federated American Engineering Societies is interested. This laboratory would make it possible to concentrate attention on the scientific side of flood control and other hydraulic problems. John R. Freeman and Mortimer E. Cooley have been invited to make the initial presentations of the matter before a sub-committee of the Senate Committee on Commerce, appointed for the purpose of considering that measure.

Water Power Regulations.

Following the definite action taken on the depreciation regulation, the United States Federal Power Commission is planning to take up for early consideration the regulation dealing with accounts and reports. A final conference with representatives of the National Electric Light Association and of the National Association of Railroad and Utilities Commissioners will be held the first week in September, when it is believed an accounting system can be worked out which will be adapted to the needs and wishes of licensees and of the state commissioners.

The Sixteenth Annual Convention of the Western Canada Irrigation Association

Many of the western Branches of *The Engineering Institute of Canada* were represented at the sixteenth annual convention of the Western Canada Irrigation Association which was held at Maple Creek, Saskatchewan, and Brooks, Alberta, July 26th to 29th. The investigation, construction and operation of irrigation works in western Canada is now proving a large and evergrowing field for engineering endeavour and its importance is becoming more and more emphasized every year. The need for the proper training in Canada of young men to take their place in this work was brought out in a resolution which requested the Universities of Saskatchewan, Alberta and British Columbia, to supplement their present engineering courses to whatever extent is necessary to offer adequate instruction in irrigation engineering.

The addresses at the convention covered many agricultural and engineering phases of irrigation. Frank W. Hanna, M.Sc., until lately consulting engineer to the United States Reclamation Service, and now general manager of the Canada Land and Irrigation Company, gave a practical address on the "Limits of Pumping Irrigation", which was followed by a useful discussion. Another address of special interest to the engineers present was one by W. C. Muldrow, manager of the Columbia Irrigation District in Washington, on "The Life and Efficiency of Canal Linings." It was apparent that Mr. Muldrow had made a special study of his subject for many years and his address and the discussion which followed was greatly appreciated.

The first day of the convention at Brooks was spent in driving over some of the surrounding country. The district is being rapidly developed and presents a striking contrast to its appearance of only five years ago, whi[le] what it looked like when the first construction engineers arrived at about fifteen years ago, may be surmised. Near Brooks are two of the most interesting irrigation structures in North America — the Bassano dam and the Brooks aqueduct. It was not possible to include a visit to the Bassano dam in the programme of the convention but the Brooks aqueduct, lake Newell and many other of the engineering features of the eastern section of the C.P.R. irrigation block were visited and inspected with a considerable show of interest by many of the delegates.

Among the members of the Edmonton Branch who were present at the convention were Professor R. S. Wilson, A.M.E.I.C., of the University of Alberta, and R. Gibb, M.E.I.C., assistant city engineer of Edmonton, while the Calgary Branch was represented by W. [ ] Hutcheson, A.M.E.I.C., and M. H. French, A.M.E.I.C.

Association of Professional Engineers of Ontario

Active organization has been commenced in connection with the Association of Professional Engineers of Ontario, and at a meeting of the Provisional Council held on August eighth and ninth a sub-committee was appointed to draft by-laws, which will be considered at a second meeting of the Provisional Council to be held on August twenty-eighth.

Trade Publications

The Rotary Ash Discharge. The American Engineering Company of Philadelphia, Pennsylvania, has prepared for distribution a small pamphlet describing the Rotary Ash Discharge installed in connection with the stoker equipment of large boiler plants. The booklet contains illustrations of a number of large power plants in which the Rotary Ash Discharge has been applied to the boilers in which Taylor stokers are installed.

CORRESPONDENCE

The Transmission of Energy by the Water Molecule

Its Relation to Basic Production

Toronto, July 27, 1922.

Editor, *Journal:*—

Dear Sir:

In the July issue of *The Journal,* it was shown how the radient energy from the sun is stored in the water molecule as potential surface energy, and also how nature contrives to render this energy available as heat. It is proposed to describe here some phenomena in connection with its distribution.

We may now understand the process by which nature not only irrigates the land surface of the earth, but transmits the radient energy of the sun through the envelope of air. The energy of the sun's rays, intercepted by all surfaces containing moisture and all water surfaces, is employed to create free surface areas about the molecules in which it is stored as potential surface energy. The way the molecules are separated from the liquid is similar to the way a water drop is broken away from a larger mass. When free they move away with their kinetic energy undiminished in longer free paths, notwithstanding that each now carries a load of potential energy nearly twelve times as great as its own kinetic energy. In the upper regions of the air after various encounters with dust particles, molecules of air, and each other, the water molecules go through the first stages of their condensation during which, as we see from the table previously given, large quantities of latent heat they carry as P.S.E. are released and become effective in raising the temperature of the air. Thus, if the condensation proceeds through the tenth stage and halts, the moisture in the air will consist of small spherical particles each containing 1,024 molecules and having a diameter ten times that of a molecule, but they will still be too minute to be seen with a microscope. The heat produced, however, will be as great as 90 per cent of the whole latent heat and will be sufficient to raise the temperature of the air by a sensible amount.

This distribution of the radient energy of the sun by the water molecules carrying it as P.S.E. and releasing it to warm the air by the simple process of coalescing may be further illustrated. A garden plot in the Niagara Peninsula thirty by forty feet, has a rain fall of about thirty inches. To set free the necessary number of molecules and load them with their P.S.E., the sun must supply power equivalent to that of an engine of 1,500 horse power, running continuously throughout the year. Not only is the water furnished to enable the plants to feed and grow but the heat that "keeps up the steam" is all employed to warm the air that the plants may breathe. To produce a British Columbia fir tree the same powerful engine must work continuously for 225 years.

This is nature's means of making effective her plan of storing the sun's energy in large amounts on the earth's surface in a more or less permanent form. It enables her to maintain the water elevations as a constant source of energy which we are now using in large amounts for the first time. It brings about the necessary conditions of moisture and temperature to enable the direct sunlight to produce by chemical action the various hydrocarbons upon which our life depends. Indeed only for this the extremes of temperature during the day and night would be so great as to render life of any kind impossible.

There is no doubt that the large quantities of heat yielded up by the water molecules in the air during the early stages of their coalescence, or condensation, is a considerable factor in causing storms of various types. A large column of warm air, hundreds of miles in diameter, is gradually formed over a certain tract of the sea or land. This air being lighter begins to be replaced by colder and heavier air masses from the outside thus causing surface winds towards a common center. The motion of the earth on its axis together with the inclination of the earth's surface to the axis would then divert this central direction of the winds into a wide circular sweep so frequently recorded in the weather charts of America. The warm central water-charged column of air would spread over the colder layer beneath and the invisible water spheres would coalesce into visible particles between these layers where they would be seen as clouds and on further coalescence would fall to the earth as rain. In all this process the remaining part of the latent heat or P.S.E. would be released to warm the colder stratum of air beneath, until a state of equalized temperature and saturation would be attained marked by clearing skies and falling winds. In some cases the concentration of these phenomena in small areas would result in violent cyclonic storms. In most cases, however, the great heat produced during the first stages of molecular condensation would result in the formation of stratified layers of air of different temperatures containing water particles of unequal sizes. These particles would condense as before between the strata and tend to form clouds, thus equalizing the temperatures of adjacent layers; while, according to the degree of saturation, either the visible particles would coalesce further into rain or the clouds would disappear altogether.

Again, in some unexplained way we know that the particles of water in a cloud or stratum of air become charged electrically, not improbably by the addition or removal of electrons which are held in, and by, this force-energy-surface enveloping the spheres and from which they cannot escape. If two such charged particles happen to coalesce, the electrons in them would instantaneously make a new adjustment on a contracted superficial area. This would cause the density of the charge, (the number of electrons per unit of area), to be altered, that is, the charge would be held at a different potential. Now the water particles which come from the same part of the earth's surface would carry like charges and, consequently, any coalescence that would take place would cause an increase in potential. The mutual repulsion between these similarly charged particles would no doubt delay the coalescence by hindering contact, or perhaps in some case prevent it altogether. This may be the cause of the particles of water remaining in a cloud or fog in a stationary state of condensation. Notwithstanding this, the condensation would be considerable and the charge on the particles of a cloud or invisible stratum would be raised to a high potential difference from the surrounding air. When such a cloud or stratum meets another having an opposite charge, there would be a passage of electricity from the one to the other. At the same time the water particles of the one would be attracted to those of the other and coalescence would be greatly augmented, attended by the release of heat and increased precipitation of water. This is given as an explanation of thunder storms.

Not only human life but life of all kinds, animal and vegetable, depends on the fact that energy which comes from the sun by radiation is held on the surface of the earth in some potential form for a longer or shorter time. The only way we know now of replenishing this store of potential energy is by the production of the various hydrocarbons of which our food, clothing, and in great part our shelter consists. Nature is doing this on a prodigious scale, but probably not at so great a rate as in the carboniferous age. The capture of the sun's radient energy and its distribution by the water molecules is an essential part of the process. Only for this the heat rays from the sun would pass through the air without raising its temperature. Without the water molecules to carry the heat away, the solid surface of the earth would become extremely hot during the day by the absorption of large quantities of heat and would cool off during the night, when all this heat would be radiated into space again. The practical application of the solution of these problems lies in a fuller knowledge of the laws by which nature is working so that we may enable her to increase her output. The possibilities in this direction are almost unlimited.

To sum up; the water molecule on escaping from its liquid assumes a load of potential energy on its surface exactly equivalent to the energy of its dissociation supplied by the sun's rays. It carries this energy through the air unchanged in amount, whether its own motion be slow or swift. Through the act of coalescence on contact with other molecules in the air, both this energy as heat and its mass as water are made available at various places on the earth's surface. These then, through the action of the direct rays of sunlight in the presence of living organism, are instrumental in producing the various hydrocarbons of which the stores of the earth's potential energy consist.

Sincerely yours,

WILSON TAYLOR, B.A., Associate E.I.C.

Preliminary Notice

of Applications for Admission and for Transfer

20th July, 1922

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in August, 1922.

Fraser S. Keith, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option, Railway, Municipal Hydraulic, Mechanical, Mining or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years

Every candidate for election as JUNIOR shall be at least twenty-one years of age and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects, Geography, History (that of Canada in particular), Arithmetic, Geometry, Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits scientific acquirements ,or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members

FOR ADMISSION

CARSON—WILLIAM JAMES, of Grand'Mere, Que. Born at Danville, Que., Aug. 11th, 1894. Educ., A.A., Danville Academy, '10, and I.C.S.; 1910-11, rodman and chainman, and 1911-12, field engr's., asst. and mech. dfting., Laurentide Co., Ltd., Grand'Mere; 1912-15, field engr., on constrn. Laurentide Power Coy's. plant and dam, including topogr'l. survey of St. Maurice River; 1915-16, in chg. of party on Forest Surveys for Forestry Dept., same company; 1916, enlisted Canadian Forces; overseas, 1917-19, with Canadian Engrs.; Aug. 1917, loaned to Imperial Air Ministry for engr'g. work, acted as drainage engr. or clerk of works on aerodrome constrn., under Mr. D. Balfour, M.Inst. C.E., F.C.S., F.R.M.S.; 1919-22, engr. in chg., constrn., New Water Supply for City of Grand'Mere and engr., to Logging Divn., on surveys, design of dams, improving streams for driving purposes, etc., and to date, field engr., in chg. engr'g. work for Logging Divn., Laurentide Company Ltd., Grand'Mere; appointed City Engineer for City of Grand'Mere, May 1922 and at present design'g. a new sewerage project for the city.

ENGINEERING JOURNAL

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

PUBLISHED MONTHLY AT 176 MANSFIELD STREET, MONTREAL BY
THE ENGINEERING INSTITUTE OF CANADA
INCORPORATED IN 1887 AS
THE CANADIAN SOCIETY OF CIVIL ENGINEERS

ENTERED AT THE POST OFFICE, MONTREAL, AS SECOND CLASS MATTER

VOLUME V MONTREAL, OCTOBER 1922 NUMBER 10

Report of General Professional Meeting

Winnipeg, Man., September 5th, 6th and 7th, 1922.

An adjournment of the 36th Annual Meeting.

The General Professional Meeting of *The Institute*, convened as an adjournment of the 36th Annual Meeting, opened at the Fort Garry hotel, Winnipeg, on Tuesday, September 5th, at 10.00 a.m., President J. G. Sullivan in the chair. After declaring the meeting opened, President Sullivan called on Mayor F. O. Fowler, who extended a cordial welcome on behalf of the city of Winnipeg to the members gathered in convention. He paid a warm tribute to President Sullivan, stating that he appreciated John Sullivan's opinion as much as he did anybody's in the world, pointing out that he was an example of one who was giving the benefit of his experiences to the community. He further pointed out that, generally speaking, the engineering profession was self-sacrificing, giving its services to the public, to the community, and to the world generally without reaping all the reward. He spoke in glowing terms of the work of General Ruttan, Hon.M.E.I.C., formerly city engineer, and emphasized how fortunate the city of Winnipeg had been in getting the benefit of his engineering experience and good judgment. After outlining the earlier engineering features of the city of Winnipeg, Mayor Fowler stated that the service the engineering profession was doing for the world is not generally appreciated because it is invaluable. In concluding, he again extended a warm welcome.

President's Address

Gentlemen:

If this meeting was held at the beginning of our fiscal year, as is usually the case, I could address you on the subject of the merits of the outgoing officers, and on the work we hoped to accomplish. That would not be an appropriate subject at this period of the year, and as you are to hear later, from a very prominent member, a discussion on Society Affairs, I will not trespass on that ground, but will confine my remarks to a subject which effects the individual welfare of our members. The first and principal motto of our association is:—

> "To facilitate the acquirement and interchange of professional knowledge among its members, and to enhance the usefullness of the profession to the public."

This is a laudable and creditable motto and is voicing the sentiment that has meant progress for civilization. In our development the three "C's", *Competition, Combination* and *Co-Operation*, are the most important factors, and if we could only make the latter play the part in our economic problems, that it has in our social development, I feel convinced that the progress of the world would be much greater.

Engineering has been defined as the art of making a dollar earn the greatest amount of interest, and an engineer has been described as one who can accomplish with one dollar what an ordinary man can do with two; also as one who can make two blades of grass grow where one grew. This is all very flattering and possibly true to a more or less degree, but my experience and observation has convinced me that ninety-nine per cent of our work consists of supervising and directing the expenditure of capital, and further anything that obstructs or retards the accumulation of capital, and the investment of the same directly effects the welfare of the engineer. As a consequence the engineer is more vitally concerned in economic problems and conditions than the majority of

members of other professions. I would like to leave with you a few thoughts on this subject that would stimulate an interest in the same, and cause you to further study the matter. In the first place, how many of us ever give a thought as to what capital really is, and what are its limits? Possibly the best definition of capital is "stored labour". If that is accepted, it is not unnatural to be impressed by the statement we hear nearly every day to the effect that all capital is the result of labour. If you give a little study and thought to this matter, I believe you will come to the conclusion that this statement is not true, but rather that capital is the result of self-sacrifice and self-denial. If you pursue the study further you will be greatly surprised at the small amount of capital in the world, that is, the small saving we have made,—in five or six thousand years of historical times less than $600.00 per capita for the present population of the world. A further study will disclose the fact that the annual increase is very small. When you get these facts firmly fixed in your mind you will realize the absurdity of the false teaching that there is plenty in the world for all to live in ease and luxury, if the capital of the world was more equally distributed. You will realize the fallacy of the teaching that the man who labours with his hands produces from two to twenty times the amount for which he is paid; the fallacy of the teaching that the employer has unlimited resources, and that conditions can be improved by men lying down on their work and doing very little in the belief that the less they do the more jobs there will be erected for others. The demand for men during the World War has provided the opportunity for the radical socialistic agitator to put into practice some of his false teachings, and we can see the results in the general unrest all over the world, and the effect on the individuals of our profession is too apparent to require any further elucidation on my part. To sum up, the points I wish to make are as follows:

1st. The principal work of the engineer is the supervision and the construction and operation of works, for the benefit of mankind, made possible by capital.

2nd. Capital is created by self-sacrifice and self-denial.

3rd. Capital is limited and is not rapidly increasing.

If you agree with me this far you will, I think, see that it is to your interest to study the economic problems of the world, and I know if the engineers turn their attention to the problem they will come to the conclusion that the solution of our difficulties can only be by co-operation between capital and labour. If the engineers of the world reach this conclusion, it will only be a matter of time when we may expect the world's progress to increase instead of being at a standstill, as has been the case for the past decade.

E. V. CATON, M.E.I.C.
Chairman of the Winnipeg Branch.

GEO. L. GUY, M.E.I.C.
Secretary-Treasurer of the Winnipeg Branch.

Discussion on Institute Affairs

After concluding his address, President Sullivan said it had been anticipated that one of our vice-presidents would be present and give a talk on Society Affairs, also that J. B. Challies, M.E.I.C., chairman of the Committee on Policy, who had done great work for *The Institute*, would review the work of his committee. In their absence he called on the secretary to lead the discussion. Before commencing his remarks the secretary read a telegram just received from Vice-President Francis, conveying his unbounded regret to President Sullivan and the members at his not attending because of pressing public appointments. At the commencement of his remarks he con-

gratulated the Branch on the fact that the Winnipeg Branch had as one of its members an Honorary Member of *The Institute*, General Ruttan, one of the charter members of the Canadian Society of Civil Engineers, and on the fact that the president of this year was one of the Branch's esteemed members, and in the third instance, because of the splendid programme provided for the Professional Meeting. He then proceeded to review the report of the Committee on Policy, pointing out the more important suggestions of the committee, and their effect upon *The Institute*. The president then opened the meeting for discussion on Institute Affairs.

Alex. Dawson, M.E.I.C., noted the difference between the meetings of *The Engineering Institute* of to-day and those of twenty-five years ago, the young men of to-day taking a much more active and prominent part than was permitted a generation ago. He advised the younger men that they would only get from *The Institute* in direct proportion to the service they rendered. He believed that we should concentrate our efforts in assisting the younger men of the profession, referring to the scholarships offered at the University of Alberta by the Association of Professional Engineers of Alberta, expressing his opinion that we would do well to establish student chapters similar to those of the American Society of Civil Engineers.

Major G. A. Walkem, M.E.I.C., observed that as a practicing mechanical engineer, he had not found the returns satisfactory, and consequently he had branched into the commercial side, and while reluctant to advise professional engineers, he believed that those who could afford it should devote some of their time to non-professional activities, as by so doing, a great deal could be done to advance the status of the engineer. He believed the engineer was in a position to demand the returns due him. He believed that we should take a greater interest in the younger members of the profession, helping them to secure proper positions, and also proper renumeration. He hoped to see the day when *The Engineering Institute of Canada* would be in the same position as the Institution of Civil Engineers in England, and would be the authority to which the federal government would go when requiring advice on matters of engineering. He believed the engineer could make himself more prominent and take his place beside the banker and other men who seemed to wield all the power.

Geo. W. Craig, M.E.I.C., on rising to discuss engineering ethics and welfare, first paid a tribute to General Ruttan, and moved that the secretary convey to General Ruttan the greetings of the meeting, and regrets that he was unable to be present on account of ill health. The motion was seconded in toto and carried unanimously. Continuing, Mr. Craig expressed the strong belief that we should have a code of ethics to which all could subscribe as one of the strongest means of placing the engineering profession in its proper position in the eyes of the public. At present the engineer's position is not much better than that of the common laborer, largely because he had not taken a firm stand in insisting on, and fighting for what he knew to be his right. He quoted a remark of William Pearce, M.E.I.C., to whom he referred as one of the finest men in the profession, the day after he arrived in Calgary to take his present position. "When you make up your mind that you are right take a stand, we are with you". He believed that every member of *The Institute* should study the subject of ethics, master those ethics, and practice them, because hardly a day goes by that we cannot render service to our brothers in the profession, if we so desire. Engineers should fight the battles of their fellow members where abuses exist.

Charles Gray, A.M.E.I.C., expressed his appreciation of the addresses of His Worship the Mayor, and President Sullivan. He believed *The Institute* was in a position to do much for its members and be of great assistance to the men if they so desired it. He had very strong views on the question of the place the engineers should take in public life, believing they should be active in that direction, instancing that engineers should put their knowledge and views before the other members of the community, on problems dealing with the elemental forces of nature. Because the engineer had been so interested in his work

D. A. ROSS, M.E.I.C.
Chairman of Programme Committee.

he had not found time to take up active public work. He believed that the large expenditure of public moneys in municipalities should not be left in the hands of the other citizens, but that the engineers should be leaders. In the past doctors and lawyers had held the epitome of public opinion in their hands. He believed that engineers should be jealous of the status of the profession, and at the same time bring themselves more prominently before the public, letting the public know what they are doing and what the engineer is really worth. He urged the engineers, and particularly the rising generation, to put their minds on active public service, even though it meant a sacrifice. It was good training and splendid experience and a wonderful reminder of ones duty to his follow men.

P. Burke-Gaffney, A.M.E.I.C., asked when some action might be expected on the adoption of the report of the Committee on Classification and Remuneration. He

pointed out that it was obviously impossible for engineers to take any part in public life until they achieved some measure of financial independence, which was impossible under existing conditions. The secretary pointed out that the report of the committee was received by Council some months ago, and had been referred to the Executives of the various Branches, mentioning that action in dealing with the report had been withheld at the request of the Ontario Provincial Division. The present position was that the report was before the Executives of the Branches and now the Committee on Policy made definite recommendations in that connection.

Thos. L. Roberts, M.E.I.C., believed that schedules for professional work should be adopted without further delay, it being very difficult for a man practicing for himself to say what his fee should be for certain work. James Milne, M.E.I.C., stated that this was a very important matter as a man might get certain percentages but according to the ethics in vogue with some engineers they are willing to do the work for two and one-half per cent less. President Sullivan thought *The Institute* would be well advised to get ethics properly established before trying to enforce schedules.

As the time for discussion had expired, President Sullivan read an invitation from the Southwood Golf Club, to members of *The Institute*, to avail themselves of the privileges of the club; also the Old Colony Club extended its privileges. Geo. W. Craig, M.E.I.C., then moved, seconded by D. A. Ross, M.E.I.C., that this meeting approve of the report of the Committee on Policy and recommend it to the Council of *The Institute*. Discussing the motion, Mr. Ross expressed his strong feeling that the adoption of the report of the Committee on Policy was a move in the right direction. The motion carried unanimously. The meeting adjourned at 12.45 p.m.

Luncheon at Fort Garry

As guests of the Association of Professional Engineers of the Province of Manitoba the members were entertained to luncheon at the Fort Garry hotel at which D. A. Ross, M.E.I.C., president of the association, presided. The courtesy of the Professional Association in thus entertaining the members assembled was greatly appreciated. At the luncheon the Hon. F. M. Black, provincial treasurer of Manitoba delivered a splendid address.

Hydro-Electric Development

The chair was occupied by Professor E. P. Fetherstonhaugh, M.E.I.C., immediate past-president of the Branch who called on E. V. Caton, M.E.I.C., who read his paper on "Extensions to the Hydro-Electric System of the City of Winnipeg", as published in the September *Journal*, commencing at page 441. Mr. Caton illustrated his talk by numerous lantern slides.

Manitoba Power Company's Development at Great Falls

F. H. Martin, M.E.I.C., chief engineer and designer of the Manitoba Power Company then gave a description of the development, illustrated by numerous slides.

The Development Described

The Great Falls plant is seventy-five miles from Winnipeg and is reached by the Canadian Pacific Railway via Molson, thence a distance of twenty-two miles to Lac du Bonnet, the terminus of the Canadian Pacific branch line. The present plant of the Winnipeg Electric Railway Company is seven miles south-east from Lac du Bonnet, access being gained by motor boat and automobile to Pinawa. From Lac du Bonnet the route is over the power companys' railway due north for thirteen miles. Along side this railway is a double circuit steel tower transmission line, connecting the Great Falls plant with the existing power line from Pinawa. At present, however, power is being transmitted over this line to Great Falls for construction purposes.

The Site

At the site selected for the Great Falls development the river is divided into two channels by an island, known as Island No. 2, which greatly facilitates construction. The dam and power house under construction at this point will raise the present water level 46 feet, and form a pond or reservoir 2,000 acres in extent, reaching upstream a distance of five miles and flooding out the existing rapids. It had been ascertained, however, that by excavating a channel 200 feet wide, 20 feet deep and approximately 1,800 feet in length, through a rock reef at White Mud falls, two and a half miles down the river from Great falls, the entire reach of the river between the power site and White Mud falls can be lowered ten feet or more, thus making a total operating head on the plant of 56 feet, for which head the turbines are designed.

The Dam

The first portion of the dam will extend from the end of the railway on the west bank to the power house and will be of solid concrete with a maximum height of 60 feet, and a width at the top of 9 feet, affording an entrance walk to the power house. The main dam will extend from the east end of the power house across the island and the east channel, and up the east bank, a total distance of 3,500 feet. In this portion of the dam will be included skimming weirs, log slide, fish ladder, 400 lineal feet of free spillway and four large sluice gates, each 30 feet high and 50 feet wide, capable of discharging the entire flow of the river under flood conditions. The remaining portion of the dam is made up of 400 lineal feet of concrete non-over-flow dam on the island, 1,000 lineal feet of rock-fill dam with clay facing across the east channel and 1,200 lineal feet of earth embankment with concrete core wall on the east bank.

Power House

The power house will be 110 feet wide, 380 feet long and have a maximum height of 145 feet. The foundations are of reinforced concrete and will carry a structural steel superstructure with concrete curtain walls provided with steel sash. The roof will be a concrete slab covered with felt roofing. The power house proper will contain six vertical turbo-generators with the usual intake racks, stop logs, head gates, etc. At the entrance to the scroll case for each unit, three pairs of steel head gates will be provided. Gate openings will be sufficient to pass flow required for each turbine at a velocity of 4.5 feet per second. Screens consisting of heavy steel bars, 6-inch spacing, supported on a steel framework will also be placed in the intake. Stop logs will also be provided

at the entrance to the water passages for closing off the water to facilitate inspection and maintenance of the gates.

Initial Development

The initial installation is to include the power house building complete to accommodate three units. The sub-structure of the balance of the power house, for the accommodation of the remaining three units will be completed to such a point as is necessary in order that future extensions may be made without unwatering expense. The electrical installation includes two generators, the third to be installed in the space prepared when required, two banks of transformers and switching equipment for delivering the power to the outgoing lines. The dams and other permanent works will be constructed for the complete installation.

Hydraulic Equipment

The turbines will be of the single runner, vertical shaft, diagonal or propeller type, and will develop 28,000 h.p. when operating under a head of 56 feet and running at a speed of 138.5 r.p.m. Under these conditions the guaranteed efficiency is 87%. The runaway speed of these turbines when operating under full gate opening and under the effective head of 56 feet will be about 315 r.p.m. The full weight of the revolving parts of the turbine including hydraulic thrust, not including the generator field, is about 600,000 pounds. The shipping weight of each turbine with its accessories is 725,000 pounds. The water enters the turbine through a concrete scroll case and will be guided into the movable guide vanes by individual stay vanes imbedded in the concrete at their upper and lower ends. The stay vanes will be provided with foundation bolts and adjusting screws at the upper end for adjusting the cast iron pit liners. The runner will have six blades, cast in one piece with the runner hub. The operating gear to the guide vanes will be of the offset type in which the guide vane levers are offset from their radial position, and as the vanes close the levers turn in a direction still farther away from the radial position resulting in a toggle action, which greatly improves the speed regulations of the unit.

The governors will be of the double floating level type with relay belt drive from the main shaft provided with hand control mechanism and the usual accumulator tanks, connecting piping, tachometer, etc., and electric motor for remote control. The governor will adjust the gates without "hunting" when the speed varies one-half to one percent from normal, and they will be adjusted to open or close the turbine gates in not more than three seconds.

The draft tube will be formed in the concrete and will be of the centrecone spreading type, the centrecone extending upwards to an elevation just below the runner, the upper end being provided with a cast iron cap which will extend through the lower end of the runner cap forming a pedestal for supporting the rotating element of the turbine when the thrust bearing is dismantled.

Electrical Equipment

The generators will be of 21,000 kv.a. capacity, of the vertical type, running at 138.5 r.p.m. The machines will have a guaranteed efficiency of 97.1 percent and reactance of 18 percent. The weight of the machine is
He referred to Messrs. Chace, Scott, and Brereton.

480,000 pounds with flywheel effect of 10,000,000 pounds feet square. These machines will generate three phase, sixty cycle, alternating current at 11,000 volts, and will be provided with 150 k.w. direct connected exciters.

The entire revolving element of the unit will be supported by a Kingsbury thrust bearing mounted on top of the generator stator. This bearing has a capacity of 950,000 pounds at a speed of 138.5 r.p.m. and is provided with water-cooling coils and the usual valves, thermometers and indicating devices which are customarily furnished with these bearings.

The transformers will be 7,000 kv.a. each single-phase, water-cooled, 11,000/63,500/110,000, with taps in the high tension winding to give 10,000 volts reduced capacity in the low tension windings. The guaranteed full load efficiency is 98.8 per cent regulation at full load and unity power factor is 1.5 per cent and impedance approximately 9½ per cent. The temperature rise at full load until constant is 55 deg. C. The insulation test high voltage to low voltage winding and core is 170,000 volts, and from low tension windings to core 25,000 volts. The voltage across full winding is twice the normal. Each transformer requires 2,000 gallons of oil, weighing 17,300 pounds. The weight of the transformer less oil being 30,000 pounds. The height over the leads is 200 inches and over the cover 145 inches. The floor space covered being 92 inches by 99 inches.

Each generator will be connected direct to the low tension side of its transformer bank without any intermediary oil circuit breakers or busbars which virtually makes each generator and its transformer bank one unit. The high tension oil circuit breakers connecting the transformer to the high tension busbars and line are of standard G.A. 3 type, 73,000 volts with interrupting capacity of 5,600 amps, and each switch is provided with automatic overload trip.

General

The design of the plant is modern in every respect and in physical dimensions and quantity of water used the turbines are among the largest for which contracts have ever been awarded. The physical cost for the initial installation including all permanent works for the complete development is less than $100 per h.p., and for the complete plant will be less than $60 per h.p., which is undoubtedly the lowest unit cost yet recorded on this continent for a plant of this magnitude.

The plan of development is in accordance with the general scheme of the Water Power Branch of the Dominion Government and forms the principal link in a chain of potential developments extending from the Lake of the Woods to Lake Winnipeg.

The contractors for the work are the Northern Construction-Fraser, Brace, Limited, who have successfully completed other large construction jobs of a similar nature.

Discussion

Mr. Caton mentioned the fact that the city's plant was very intimately connected with *The Institute* as three of the past-chairmen of the Branch had been responsible for the actual work on that development and on that foundation the success of the present plant had been laid.

F. H. Martin, M.E.I.C., asked Mr. Caton if the gates described could be closed when the units are in operation,

to which Mr. Caton replied that, starting with a unit running on full load and the gates wide open, with the head gates on the carrier, they could be placed in position within less than fifteen minutes from the time started, and while that might seem a long time, it was not a question of time but a question of saving about fifteen thousand dollars on each unit. James Milne, M.E.I.C., Toronto, inquired regarding the cost of the finished product in order that comparisons might be made between the work being done here and elsewhere. He mentioned the difference between the position Winnipeg was in, in having the power absolutely under its own control, and those cities in Ontario where they had no say regarding the operation of the plant. He considered it worth the extra cost to be in the position of independence of Winnipeg. Replying, Mr. Caton stated that the present cost to the city at Point du Bois is slightly under seventy dollars, but with the completion of one hundred thousand horse-power installation it was anticipated that the price would be in the neighbourhood of sixty dollars. Although part of their work was done during the war, the city had a cost-plus contract whereby the contractor was penalized fifty per cent of the excess, and received a bonus of twenty-five per cent of the saving.

Proportioning of Concrete

Major Walkem, of Vancouver, asked Mr. Martin as to his idea regarding pouring concrete and his experience regarding the effect on the strength of concrete by using a very wet mix, sufficient to make it follow a chute on less than a natural angle. Replying Mr. Martin stated that some engineers required in their specifications that the concrete should be very wet. He believed the drier you can make concrete the better and stronger it is. They used a form which was removed immediately after the concrete was placed. While the contractors would like to have the concrete very wet, they insisted on an increase in cement with the wet mix. He personally did not favour chuting. He was strongly in favour of a very dry mixture. Speaking of the water ratio and the strength of cement concrete, Mr. Caton asked if any engineer had evolved a successful plan under a water-cement ratio which the contractor would understand and follow, and how such a contract would be worded. Mr. Martin replied that the answer to Mr. Caton's question lay in a definite specification as to the grading of the mix. A specification calling for a 1–2–4 concrete did not mean anything unless the grading was definitely specified. He mentioned an instance of concrete laid in Massachussetts twenty-three years ago, using a mixture of eighteen to one, the concrete being as strong and dense to-day as any that had been placed since that time. He believed the day would come when aggregate would be purchased in bags in the same way that cement is bought at the present time. His only excuse for tolerating a wet mix was that, due to the extreme amount of reinforcement required in a vertical type wall, it was necessary in order to get the concrete to flow in between the reinforcing. W. P. Brereton, M.E.I.C., instanced the method adopted in connection with the construction of Maryland Street bridge, Winnipeg. Months before commencing operations a series of concrete blocks, six inches in diameter and twelve inches long, were made and tested after twenty-eight days, and the aggregate chosen was the one giving the most economical mix and the required strength, taking into account the water-cement ratio. During the construction of the work every day two blocks were made from the concrete, marked, preserved and tested after twenty-eight days set. The effect of water-cement ratio was very strongly shown in connection with the test of these blocks. In the arch proper, where the greatest strength was required, particular attention was paid to the water-cement ratio. The concrete was poured very dry and thoroughly tamped by competent men. He had found in the heavily reinforced walls, where the concrete had to be poured considerably wetter than in the arch, the strength was very much reduced using the same amount of cement. That in the arch tested as high as three thousand pounds per square inch, and averaged about twenty-six hundred, while in the walls, the strength was from twelve hundred to fifteen hundred pounds to the square inch, the difference being due to the water-cement ratio as far as they could determine.

Additional Points Discussed

In response to a question regarding the design of the racks as to whether it had been necessary to consider full water pressure, Mr. Brereton replied that in considering the design, it was decided that they might sometimes become clogged so that, instead of assuming a factor of safety of three or four, the racks were designed as a dam. So far the racks had not become clogged at any time. Asked as to when they expected to deliver power from the Great Falls plant, Mr. Martin replied that they expected the first unit to be in operation by Christmas, most of the work completed by this time next year, two units being put in at the present time to be followed as soon as possible by the installation of the third, fourth and fifth units, and the whole plant to be completed within the next five years. D. A. Ross, M.E.I.C., referring to the cut in the river at White Mud falls, of two hundred feet, the river being six hundred feet wide, the cut being designed to lower the water an additional ten feet on the lower side of the works, asked Mr. Martin if he considered the two hundred foot cut sufficient to take care of the water in the flood period, so that there would always be the additional ten feet. Mr. Martin replied that the whole matter had been thoroughly considered and that they had some very interesting charts and diagrams and mathematical computations which he was sure *The Institute* would be interested in and which he would be glad to present at some later date. He believed that they could take care of the flood water of the river. It was really a problem of determining the right amount of rock to take out and to estimate the cost of that and balance it against the loss of head through the cut and extreme floods. James Milne, after discussing the various factors in connection with arriving at a rate for electricity, asked for information as to the average cost for power under ordinary operating conditions. Mr. Caton replied that in Winnipeg there were almost as many rates as customers, instancing the Winnipeg Water Works rate as five-eights of a cent per kilowatt hour. He had always argued in favour of a straight kilowatt hour rate. He considered a rate of so much a kilowatt a year as being useless, the governing factor being the total consumption. C. H. Blanchard, A.M.E.I.C., asked what had been the experience in power developments on the Winnipeg river regarding

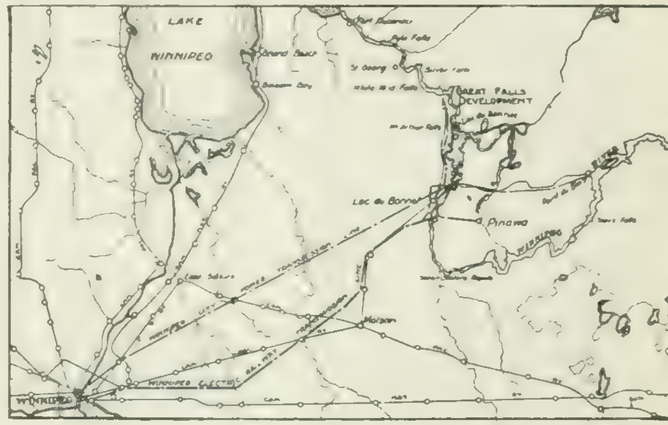
clearing the land where areas were flooded, and if the timber had given trouble where left standing in the flooded area. Mr. Caton stated that the flooded timber area, due to the city plant, was three and one-half square miles, none of which was cleared. It had gradually come off and occasionally appears under the racks. Once a year a diver is employed who goes down to remove some water-logged timber. It had certainly not affected operations sufficient to have warranted clearing the land before the flooding took place, the reason possibly being due to the wide river and the slow current. Continuing the discussion, Mr. Martin mentioned that in the Pinawa development the land had not been cleared and that no trouble had been experienced. At the Great Falls development approximately twelve hundred acres would have to be cleared, a large part of it very heavily wooded with large spruce and poplar, due to government regulations. It was estimated that the revenue from the sale of the timber would more than pay for the clearing. The contract had just been let for a portion of it for cutting the ties and for cutting the timber into cordwood at one dollar and fifty cents a cord. From one acre thirty-seven cords of wood and one hundred and sixty-four ties were obtained, and they were paying from three-fifty to five dollars a cord for wood for fuel purposes. From the result of this experience they had allowed nothing in their estimate for clearing. Major Walkem referred to an experience of the B.C. Electric Railway Company when they built the dam at Coquitlam. Although the land had been cleared, as required by the government, torrential rains flooded lands never flooded before, gathering debris from the logged-off area which broke the dam and washed out the pipe line of the city of New Westminster, so that the city was without water for six months, causing a damage of about two hundred and fifty thousand dollars, illustrating the seriousness of such a situation in a heavily wooded country, as to how well the logs are cleared off the land and the debris collected.

Guests of Winnipeg Branch

As guests of the Winnipeg Branch the members participated in an enjoyable function on the first evening of the meeting. The Motor Country Club, which is the original Lower Fort Garry preserved intact both as to buildings and surrounding fortifications, was the objective. Motor cars provided by members of the Branch conveyed the party from the Fort Garry hotel to the club. The dinner which was served could not be surpassed, and after two hours of social enjoyment the party returned, everyone well satisfied that the first day's proceedings had been an unqualified success.

Excursion to Great Falls and Point du Bois

One of the most interesting days outings ever provided a body of engineers was that of Wednesday, September the sixth, when about two hundred and seventy-five members and others interested, visited the Great Falls development of the Manitoba Power Company Limited, and the Point du Bois plant of the city of Winnipeg as guests of the city of Winnipeg and the directors of the Manitoba Power Company. As excellent papers on both these undertakings had been presented on the previous day, the visitors were in a better position to appreciate all they saw and heard on this memorable trip. In addition to a special train, which left the C.P.R. station at eight o'clock in the morning, lavish entertainment was provided continuously throughout the day. The whole days outing was an illustration of the fact that as hosts and entertainers the westerners excel.



Map of Winnipeg River, showing location of Great Falls development of Manitoba Power Company, Ltd.

The Great Falls development of the Manitoba Power Company was first visited. The accompanying map shows the position of the power site and its geographical relation to the other power plants and to the city of Winnipeg. A handsome souvenir of the trip was distributed containing a description of the plant by the chief engineer, F. H. Martin, M.E.I.C., with a colored plate showing a birds-eye view of the plant contemplated, and embodying greetings from the president, Sir Augustus Nanton, and the vice-president, A. W. McLimont, in part as follows:—

> On behalf of the Manitoba Power Company Limited, we desire to express to the members and guests of *The Engineering Institute of Canada* our sincere appreciation of the honour and privilege conferred upon us in so arranging their programme for the 36th annual meeting as to accept our invitation to inspect to-day our large hydro-electric development now under construction at Great Falls on the Winnipeg river.
>
> The engineering profession realizes, we believe—possibly clearer than any other group of men — how vitally important to the continued growth and prosperity of a community is a reliable source of low cost hydro-electric power. We feel that the development you will see to-day, not only will be of benefit to the Winnipeg district but also will serve as a national asset of primary importance in assisting in the needed industrial growth of the west.
>
> At present the greater part of the manufactured products demanded by the fast growing population of western Canada are secured either from factories 1,200 to 1,500 miles away in eastern Canada, or from nearer foreign plants in the United States. Regardless of their origin the western consumer pays too dearly for such goods.
>
> Winnipeg, located at the threshold of the west, in the very centre of the Dominion, served by better railway facilities than any other manufacturing

district and with an abundance of labour is rapidly developing into a great industrial community and is to-day Canada's third city in value of products and population.

It is instructive to note how Winnipeg's industrial progress has kept pace with the supply of hydro-electric power. It is interesting at this time to recall that when the initial hydro-electric development of the Winnipeg Electric Railway Company at Pinawa — a total of only 7,000 h.p. — was contemplated there were those who predicted it would take many years to absorb all the power. Later when the first development was increased to 10,000 h.p. the ability to dispose of the added power was questioned even more strongly. However, from time to time the growth of industry in this district has necessitated added units in the Pinawa development and now, within less than twenty years from the time the Pinawa plant was started, you gentlemen to-day will see active construction proceeding on the initial units of another hydro-electric plant with an ultimate development of 168,000 h.p.

When the Great Falls development is completed and the power from it, available for commercial use, has resulted in bringing millions of dollars of new capital into this western country, proving an important factor in the development of the natural resources of the country and stimulating every line of industrial activity in the community, one will then be better able to judge of the enterprise and initiative of those pioneers who laid the foundations for this plant. The men who planned the building of the Pinawa plant and now the Great Falls plant, and who have lived to see their faith in the future of this city justified, are just as confident to-day that within a decade all the power from the present plants on the Winnipeg river will be absorbed, and enterprising business men will then be aiding in the establishment of additional power plants to furnish a further supply.

The engineers of the company are: — supervising engineer, Julian C. Smith, M.E.I.C.; consulting engineers, L. J. Hirt, M.E.I.C., R. S. Lea, M.E.I.C., and C. O. Lenz; chief engineer, F. H. Martin, M.E.I.C.; assistant engineer, T. W. MacKay; resident engineer, T. Lewis; and assistant resident engineer, B. S. MacKenzie, M.E.I.C. The contractors are Northern Construction — Fraser, Brace Limited, president, J. M. Brace, M.E.I.C.

On arriving at the site the party was given ample opportunity of inspecting the works, construction of the dam and power house being well under way. Luncheon was served in one of the dining rooms of the company where the party, as guests of the company, was given an excellent meal from the electrically equipped modern kitchen. On behalf of the company, A. W. McLimont extended a cordial welcome to their guests and expressed the pleasure it gave them to be able to entertain a group of engineers who would appreciate the work being done. J. H. Brace, M.E.I.C., gave a description of the work from the contractor's view point, all modern engineering skill being adopted both in the construction and the equipment. President Sullivan, on behalf of *The Institute*, voiced the feelings of all present in a brief expression of sincere thanks.

Trip to Point du Bois

Immediately after lunch a group photograph was taken, following which the party proceeded to Point du Bois, where the modern plant owned by the city of Winnipeg is located, details of which were given in the paper on the plant by E. V. Caton, published in the September *Journal*. Arriving at the plant, the visitors were given a demonstration of municipal ownership at its best, under the able management of J. G. Glassco, M.E.I.C. In addition to the plant, Point du Bois embodies a modern village owned by the city of Winnipeg, the ladies of which had prepared a magnificent banquet which awaited the party on their arrival at 5.30 p.m. The scrupulous cleanliness of the entire plant was a matter of universal comment, and no banquet hall offered a finer setting to the score of tables with their charming attendants than the turbine room of the plant where the meal was served immediately after arriving. A handsome souvenir of the City of Winnipeg Hydro-Electric System was presented to each guest with the manager's compliments, giving the history and development of the plant by J. G. Glassco, M.E.I.C., and E. V. Caton, M.E.I.C.; and containing a large number of beautiful illustrations. At the conclusion of the dinner on behalf of the city, Mr. Glassco welcomed his visitors in abrief address to which President Sullivan replied expressing sincere thanks to Mr. Glassco for his kindness and hospitality. A toast to the ladies was proposed by D. A. Ross, M.E.I.C., which was responded to by all present giving three hearty cheers. After two hours inspection, the party was escorted to the station and given a rousing send off by the entire populace. The special train containing the party arrived at the C.P.R. station, Winnipeg, shortly before midnight, the unanimous opinion being that it had been one of the finest outings imaginable.

Session of Thursday Morning, September 7th

Civil and Geological

Owing to the number of papers to be presented, the morning and afternoon sessions of Thursday were divided into two sections. In the morning, the sections were civil and geological, and in the afternoon, civil and mechanical.

At the morning civil section, the chair was occupied by John Porter, M.E.I.C., who called upon S. B. Wass, M.E.I.C., who read his paper, "Improvements to Moncton Yard and Engine Facilities" published in the September *Journal*. In response to a question regarding the use of a stiff legged derrick, Mr. Wass explained that it was used to excavate the foundation for the reinforced culvert, being simply built upon a frame, carried on a grillage on rollers, and was hauled back from the excavation under its own power as it completed one section. With this method there was no difficulty even on soft ground, when the timbers were properly put down, in making excavation.

Fred. Newell, M.E.I.C., then read his paper "Automatic Box Car Unloaders for Grain" as published in the September *Journal*, and owing to the lateness of the hour there was no time for discussion.

At the geological section meeting the chair was taken by J. M. Leamy, M.E.I.C., who called upon G. R. Pratt, A.M.E.I.C., to read his paper "Fuel Values of the Coals of Alberta." Economy in the burning of fuel was illustrated in a number of slides, following which Mr. Pratt pointed out that economy was not always the first consideration, for, in the case of public utilities, continuity of service was the main consideration and economy secondary in the case of a crisis.

Civic Luncheon

Following the morning session the automobile committee had an ample supply of cars waiting to convey the members to Assiniboine Park where a civic luncheon was tendered to over two hundred members and invited guests. For the second time during the progress of the convention, Mayor Fowler conveyed a welcome on behalf of the city and again eulogized the engineering profession in glowing terms. An able response in the name of *The Institute* was made by Major G. A. Walkem who is an alderman for the municipality of Point Grey, B. C.

Session of Thursday Afternoon, September 7th

Mechanical Section

The chair was occupied by Professor N. M. Hall, M.E.I.C. In the absence of H. S. Van Patter, A.M.E.I.C., his paper, published in the September *Journal*, describing the twenty-eight thousand horse power turbines for Great Falls development, Manitoba Power Company, was read by Geo. E. Bell, M.E.I.C., manager of the Dominion Engineering Works. The discussion which followed the reading of the paper brought out a number of points in connection with the design of propellor wheels, and a number of questions were answered by Mr. Bell regarding the manufacture and development of the particular type about to be installed. The chairman thanked Mr. Bell for reading the paper and for adding so much to the discussion.

Civil Section

The chair was occupied by Professor J. N. Finlayson, M.E.I.C. In calling on M. A. Lyons, A.M.E.I.C., chief engineer of the Manitoba Highways Commission to read his paper, the chairman stated that he needed no introduction to the members of *The Institute*.

Consideration of a Road Policy

This paper, as published elsewhere in this issue, was in the hands of the members in advance proof form, and was not read entirely by its author who dealt with the main features. He explained that one of his reasons for naming his paper as he had was because *The Engineering Institute*, following a resolution of a professional meeting at Saskatoon a few years ago, had appointed a committee to draw up specifications, including a road policy.

In Manitoba, the roads were handled under two organizations. The Reclamation Branch dealt with opening up new country and colonizing roads and the Good Roads Board dealt with the roads in the older municipalities with the idea of improving roads which had already been used for some time. To get assistance from the government under the Good Roads Act it was necessary for a municipality to lay out a scheme of roads and make application to the board. The board sends out an engineer who makes a study of their proposal and an estimate of the cost, suggesting changes he may think advisable. Conferences between the board and the municipality are held until a road scheme, mutually satisfactory, is arranged. The municipalities have three methods of financing: — first, to pay the costs out of current revenue, second, by special tax, and the third, by an issue of debentures for their share, and the share debentures must not exceed the engineer's estimate of the municipality's share of the cost. Where debentures are issued, after the scheme has been approved by the board, the work can be advertised and contract let subject to the approval of the board. Most of the work is done by contract.

There are two classes of roads, market roads and provincial highways. The selection of a provincial highway remains under the influence of the board, the government paying two-thirds of the cost of construction and maintenance. On market roads, if they are gravelled, they pay one-half of the cost, and on earth roads one-third of the cost. The government also pays one-half of the cost of concrete and steel bridges, and one-third of the cost of wooden bridges. Maintenance is left pretty much to the municipality, and while some look after maintenance well, others are reluctant to spend the necessary money. Up to the present there are about five thousands miles of roads brought under the Good Roads Act, and on market roads the total amount expended up to the end of 1921 was four million two hundred thousand dollars, of which the government paid one million nine hundred thousand dollars. On provincial highways there has been spent one million five hundred thousand dollars of which the government paid slightly over one million dollars. On pavements around the cities, of nine hundred and eighty-four thousand dollars spent, the government paid three hundred and twenty-four thousand. On bridges, the most of which are concrete, the total cost to the municipalities has been one million two hundred thousand dollars and the government has paid five hundred and eighty-nine thousand. Up to the end of 1921, the total mileage of roads made since the beginning of the Act was two thousand eight hundred and fifty-five; the total mileage gravelled was nine hundred and fifty-three; the total mileage paved twenty-four; the total number of bridges and culverts, seven hundred and eighty.

After showing a number of slides illustrating the country through which the roads were being built, Mr. Lyons pointed out that one of the weaknesses of the present system is that it is very difficult to get a complete through highway built.

Professor E. F. Chandler pointed out the fallacy in locating roads along township lines, instead of following the contour of the ground, pointing out that where a section line includes a steep grade, the road is built there regardless of the fact that by the purchase of a few acres of land, the road could be built where it naturally belonged, saving ten times the subsequent expense and ten times that amount per year in economy in transportation.

C. W. Dill, M.E.I.C., formerly chief engineer of the department of highways of the province of Saskatchewan,

congratulated Mr. Lyons on his paper. He referred to conditions in Saskatchewan and to a paper, presented by him at the professional meeting in Saskatoon a year ago, in which he had outlined a number of restrictions regarding the use of the road that were in effect in New Brunswick, where the roads are absolutely under government control. He mentioned the difficulty of keeping people off roads at a time when traffic should not be allowed, except from great necessity. He cited a case of a motor truck running on a road from Regina to Moose Jaw, which had been built as a demonstration road, irrespective of the condition of the road. It had made a rut from three to eight inches deep practically the whole length of the road. A farmer will draw a tank load of wheat the whole way to the elevator when the roads are wet, doing more harm on one trip than they could do good in maintaining the road for the whole year. The maintenance of an earth road costing from fifteen hundred to four thousand dollars a mile being a serious matter, he had endeavoured to get people interested by showing them that the amount expended for maintenance was the same as paying a premium on an insurance policy to keep active the investment. Owing to the high cost of gravel over the greater part of the prairies, (it would take about three years to build a gravel road), the additional cost of a hard surface road would be so little that it would not really pay to gravel most roads, citing particularly that between Moose Jaw and Regina.

Asked as to a fair estimate of maintaining an ordinary gravel road, Mr. Lyons replied that it depended on the road, the traffic and the location, and considered a gravel road after five years pretty well worn out, the base being there but requiring an additional coat of gravel. In Wallace municipality where there were good roads on light soil, and the traffic not very heavy they spend about twenty to twenty-five dollars per mile. In Rockwood with similar traffic and gumbo a little heavier, about forty dollars a mile, this being for dragging only, the road not being kept in first class condition. It was essential to drag the road after heavy rain, and a new coat of gravel, practically every year after the first year. Asked as to his experience in using oil on gravel roads, he replied that nothing had been done in the province of Manitoba.

Mr. Dill stated in connection with the oiling of roads, that he had written chief engineers of a number of north western states to get information on that subject, and had found that all of them were rather against the idea, except as a local treatment for the year in which it was done. Oil laid in the springtime was good until the fall rains or until the frost, being simply more or less of a dust eradicator for the summer months. Mr. Milton referring to Mr. Chandler's suggestion, pointed out that a road was being built by the Good Roads Board to Point du Bois, and instead of following the township line was following the natural conditions of the ground. President Sullivan considered Mr. Chandler's suggestion a good one, having often thought it would be a good plan to have the country cut up into sections eight miles to a side, running the roads diagonally. Mr. Lyons said that it was very easy for engineers to see the benefit of such a method, both in saving of distance and cost of hauling, but those who would be benefited most could not see it that way. He referred to the fact that the Dominion government, when Manitoba entered confederation, was supposed to make a survey of all the old trails and turn them over to the province, but in many cases, in giving titles they had omitted to reserve the road. Some had been closed up and reopened again. The old trails would make excellent highway routes, but it was going to be a difficult matter to use them.

The chairman then thanked the author and those who took part in the discussion.

The Chemistry of Portland Cement and its Disintegration by Alkaline Ground Waters

In introducing Dr. T. Thorvaldson, professor of chemistry of the University of Saskatchewan, Chairman Professor Finlayson, M.E.I.C., stated that about a year ago the committee of *The Institute* appointed to investigate the action of ground waters on concrete in the prairie provinces had looked around for a chemist and had been fortunate in securing the services of Dr. Thorvaldson, who had given a year of his time to the problem. Dr. Thorvaldson then read his paper on the Chemistry of Portland Cement and its Disintegration by Alkaline Ground Waters as published in the September *Journal* page 457.

Work of Institute Committee

Following the reading of his paper, Dr. Thorvaldson advised that he had been requested to give a very brief summary of the chemical research work which is being carried on at the University of Saskatchewan on the problem of the action of alkaline ground waters on concrete.

You probably all know that a committee of your Institute under the chairmanship of Dean C. J. MacKenzie, M.E.I.C., and with membership from the three prairie provinces is responsible for the conduct of this investigation, and that the chemical work in connection with it, has been in progress for one year, while the field investigation in charge of Professor G. M. Williams has already extended over a somewhat longer period.

This investigation may be considered in three stages, the first being a study of concrete in the field under alkali conditions and the study of ground waters with a view of establishing whether the action of alkaline ground waters does cause failure of concrete of good quality, we may consider that this stage has been passed, for it has been established without a doubt that the best of concrete will fail under severe alkali conditions. The second stage deals with the exact determination of what constituents in the ground waters cause the deterioration of concrete, and what happens when concrete goes to pieces through the action of ground waters — namely a study of the chemical reactions which take place in concrete during alkali action. The third and the final stage, will be to discover a means of preventing the action, or the development of substitutes for the building materials at present used where alkali conditions are severe.

Your committee has decided that it is advisable to attempt to diagnose the disease before we proceed to seek remedies. This decision is partly due to the failures met with by all of those who have been groping around in the dark for remedies. We may therefore consider that the investigation is at present at the second stage while we have hopes of soon proceeding to the third stage.

The method of attack involves the preparation and the study of the chemical behaviour of all the substances

present in cement systems when acted on by solutions of the various salts present in the soils of alkali districts. Also the study of the chemistry of cement systems which have been disintegrated by the action of alkali salt solutions. This includes a study of the solidities of all the substances which may be present in such systems, as well as the chemical reactions which take place when they are in contact with the solutions concerned. We have already studied in this way the oxides and hydroxides of iron alumina, calcium and magnesium, the carbonates of calcium and magnesium silica, hydrated silica, some simple silicates and some other substances. We are at present engaged in the study of the three most important compounds of Portland cement, namely, tricalcium silicate, dicalcium silicate and tricalcium aluminate in alkaline salt solutions.

Numerous series of experiments are in progress for the direct study in the laboratory of the action of salt solutions on cements, mortars and concrete and the chemical changes which take place during this action. We are also studying the colloidal changes which take place during the action of these waters on concrete.

In this work we are using in close co-operation both chemical and petrographic methods. What we cannot see under the petrographical microscope we attempt to elucidate by chemical methods and when possible we confirm by microscopic study the conclusions of the chemical experiments.

We hope that by these methods of attack we may gain an understanding of the chemical changes which take place when concrete disintegrates through alkali action, and that this knowledge when gained may direct our search for a successful remedy.

Discussion

Opening the discussion Dean C. J. Mackenzie, M.E.I.C., chairman of the committee, stated that any work he had done on behalf of the committee was that referring to the first stage, and while a certain amount of work had been done on the physical side it was fairly familiar. His work as chairman consisted in collecting funds and paying bills, but he would be very glad to answer any questions.

A. G. Blackie, city chemist, Winnipeg. "In Dr. Thorvaldson's paper we have heard one of the best descriptions of the action of alkali ground waters on concrete that it has been my lot to listen to.

In 1908 I was instructed by the city engineer to investigate a sewer that had collapsed in Winnipeg. As a result of the investigation I reported that the collapse was due to the action of certain salts in solution in the ground water that came in contact with the sewer, and contrary to the usual belief, sewage or sewer gases had nothing to do with the collapse. I must say that that report was received with a good deal of scepticism, until I was able to establish by demonstrating in the laboratory that solutions containing sodium and magnesium sulphates destroyed concrete, but for a long time after that report was made, the few of us who were convinced that there was such a thing as alkali action on concrete had a hard row to hoe.

With regard to ground waters, Dr. Thorvaldson points out that in Alberta sodium is the prevalent sulphate, and in Manitoba magnesium is, whilst Saskatchewan falls between the two. (see Analysis of Water from the Prairie Provinces in Dr. Thorvaldson's paper.) I wonder if Dr. Thorvaldson can give any explanation for the gradual increase in magnesium as the ground water comes east, and also whether he thinks that the magnesium or sodium bearing waters do the greatest damage. In the laboratory I have found that by increasing test pieces, first in one sulphate solution and then in another, disintegration is brought about much more rapidly than when a single solution is used.

The failure of concrete exposed to sea water is a curious thing. There have been cases of very serious failures, but the instances in which concrete placed in sea water has withstood damage far outnumber the cases of failure. Why is this? Is it purely a case of the density of the concrete and the true proportioning of the aggregate, or is the cement itself responsible?

Dr. Thorvaldson has outlined the reactions that take place during the burning of Portland cement, when pure materials are used. You will have realized that the reactions are complex and the ultimate composition of the clinker depends upon the temperature that the burn is taken to. When the final temperature reaches something below 1,650 deg. C., the clinker has an approximate composition of 45% tricalcium silicate, 35% dicalcium silicate and 20% tricalcium aluminate.

Now, the ordinary limes and shales used in the manufacture of Portland cement are not pure materials, but contain quite a lot of impurities. Of these the most important is iron oxide. One of the effects of iron oxide will be to reduce the melting point of the clinker, and you can quite understand that different cement mills working in different parts of the country will have raw materials to deal with of very varying composition. Will not these variations cause considerable variation in the composition of the clinker, and is it not possible that the different mills will turn out cement with varying proportions of the two calcium silicates and aluminates? If this is so, may it not have a considerable bearing on why cement sometimes fails in sea water? I often wonder whether the modern cement mill with its high temperature rotary kiln is not to some extent responsible for our present day troubles.

You must remember that the ordinary methods of chemical analysis will not differentiate between or tell the proportion of dicalcium to tricalcium silicate, and of course for this purpose the standard methods of testing cement are also valueless. I wonder if Dr. Thorvaldson would care to tell us anything about the various treatment external and integral that are in the market, and are supposed by their makers at least to have solved the problem of alkali and waterproofing concrete. Personally, I have little faith in them, but I feel that both architects and engineers are often misled by the claims of the makers and vendors of such preparations."

Replying to Mr. Blackie's question, Dr. Thorvaldson mentioned the interesting fact that the waters in Alberta have a larger amount of sodium sulphate while waters in Manitoba predominate in magnesium sulphate. While there is a prevailing tendency for the Alberta waters to contain a large amount of sodium sulphate there are some there that contain a fair amount of magnesium sulphate. The difference in the composition of the Alberta and Manitoba waters might be accounted for by the fact that

in general the rivers run east in Alberta, Alberta being the highest point, and because magnesium sulphate is more soluble, especially at lower temperatures, than sodium sulphate. As to the variations in the compositions of cement due to the variation in the raw material he thought that it was the proportion of alumina and lime and silica present in the original material that counted, and, in general, not the combinations in which these were present in the raw materials. The temperature being so high during burning practically alters the chemical constitution of any rocks being used, so that the form the lime and silica and alumina are in does not make any difference. He realized that there might be exceptions to this but that the same kind of cement, under the same conditions of burning, would be formed, but the impurities certainly do make a difference, and therefore there might be a marked difference in cement with identical treatment, according to raw materials used, with the same proportion of lime and silica. He referred the question of water-proofing materials to Professor Williams.

Professor G. M. Williams, A.M.E.I.C., secretary of the committee, mentioned that his work was confined entirely to the first phase of the committee's programme, and that laboratory conditions could not reproduce those of the field, such as alternate wetting and drying. They had demonstrated that the action is dependent on the presence of sulphates in concentration. Generally speaking the results from waterproofing materials do not seem to indicate that they are going to be of any beneficial effect. There is a prolongation of life where there is a membrane of waterproofing which remains watertight. If the salt solution could be kept from the concrete there is no danger of disintegration.

Dr. Shipley, professor of chemistry, University of Manitoba, pointed out that immediate results could not be expected from Dr. Thorvaldson's work, comparing the situation with the study of disease, he thought that if the diagnosis of the complaint became known within one or two years, it would be making very rapid progress. In the meantime he thought considerable attention should be paid to protective means and when the disease was known to find some method of preserving the material or preventing reaction.

W. N. Smith, M.E.I.C., spoke of the alkali corrosion of gas pipes in the ground at San Diego, stating that the company had covered over a million feet of ordinary black steel gas pipe with a membrane of asbestos, felt and burlap, put on with hot asphalt, which had been very successful. He pointed out the importance of the question of the tremendous destruction of metal from corrosion every year and, being an economic waste, engineers should concentrate their attention on it.

Asked by A. A. Young, A.M.E.I.C., if it was safe to assume, once disintegration had started and the removal of the ground water had taken place, that action had ceased, even if moisture from rain is still in contact with the disintegrated concrete, Dr. Thorvaldson stated that if there is a large amount of disintegrated concrete in contact with the other, and that disintegrated concrete contains a large percentage of sodium sulphate, and magnesium sulphate it is not necessary to add any more salt, water alone causing the action to continue. In response to a question from Mr. McLean, asking if the work on hand meant a revolution of the cement industry, Professor Williams replied that that could only be answered when we get to the third stage. Only a very small amount of cement was affected, and it did not mean that the average engineer or most engineers would be affected by the work being done.

A hearty vote of thanks was tendered to Dr. Thorvaldson for his masterly paper and discussion.

Resolutions of Thanks

At the final session on motion by Councillor G. W. Craig, M.E.I.C., of Calgary, seconded by Councillor R. L. Dobbin, M.E.I.C., of Peterborough, the following resolutions of thanks were unanimously adopted: — To the City of Winnipeg, Mayor Fowler and Aldermen, for addresses of welcome and many courtesies extended, for the visit provided to the hydro-electric power plant at Point du Bois and for Civic Luncheon; to the Manitoba Power Company for the opportunity to visit Great Falls development and luncheon there; to the Association of Professional Engineers of the Province of Manitoba for entertainment at luncheon on Tuesday; to the Motor Country Club for courtesies extended and dinner provided; to the Southwood Golf Club for extending privileges; to the Old Colony Club for extending privileges; to the owners of Autos placed at the disposal of members; to the Fort Garry Hotel management for facilities provided; to the Members of the Manitoba Government and other distinguished men who have honoured us with their presence; to the Officers and Members of the Manitoba Branch for all they have done to make possible one of the most successful meetings yet held; to the authors of papers and all others who in any way contributed to the success of the meeting.

The Banquet

We're all here together,
We're all here together,
Tell the world we're here again,
We're the Engineering men.
Da-Da-Da-Da-Da-Da-Da.

This was the refrain that echoed again and again through the Banquet Hall during the final evening of the convention, while the other songs printed on the menu were not neglected, and college yells added further evidence that a joyous spirit was abroad. From the singing of "O Canada" to "God save the King" there was no lull in the interest and no cessation of enthusiasm. A visitor remarked, "What human fellows these engineers are. I never knew it before". Thus by constant progression, we are reaching the heights. The menu provided was of the best and the speakers all men of distinction and eloquence. Between speeches there were solos by the song leader, and much community singing. The function was a fitting conclusion to a most enjoyable and successful convention.

The chair was occupied by President Sullivan. The guests of the evening were the Hon. W. R. Clubb, Minister of Public Works of Manitoba; D. C. Coleman, vice-president of the Canadian Pacific Railway; Rev. Dr. Leslie Pidgeon, D.D.; and A. W. McLimont, vice-president and general manager of the Manitoba Power Company, all of whom made notable addresses, and about twenty other distinguished citizens and visitors including past-president Colonel J. S. Dennis, M.E.I.C.

Hon. W. R. Clubb said that Manitoba had not been making such rapid progress in road making as Ontario, possibly, but it had not been standing still. In the last few years practically five million dollars had been spent on good roads. Something like nine hundred miles of

roads had been gravelled, and there were almost three thousand miles of standard graded roads. In addition half a million dollars had been spent on bridges. Ontario was catering to the tourist traffic to a large extent by the construction of highways and certainly was getting that traffic. Manitoba was not doing that to any great extent at present, but if he could believe all the expressions of opinion it might have some inducement to offer inside the next eight months for a tourist trade. (Laughter). And if Manitoba was going to have a tourist trade, it must have good roads for the tourists to travel upon. He was not there to state the policy of the government, but a few words on what might be its policy might be in order. Possibly the scheme might not be so extensive as some citizens would like, but the government would link up all the missing links of highways in the province, and would institute a maintenance or government control system because there was no use spending money in the construction of good roads and then let them go to waste. If good roads were not maintained money had been wasted in constructing them and the expenditure was not justified.

Commenting on his trip with the delegates Wednesday, to Great Falls and Point du Bois, Mr. Clubb said the hydro development had been wonderful. He looked forward to greater things. He did not think the time was far distant when Manitoba would be able to say: "We do not have to take a back seat to Ontario in hydro development." The people who had invested money in hydro development had to be acknowledged as men of vision, and he hoped to live to see the day when electrical energy would be available to every home in this fair province.

D. C. Coleman, western vice-president of the Canadian Pacific Railway, said this company had employed many hundreds of engineers, and there was no body of men in the transportation field who had displayed more unselfish devotion and more genuine love of work than the engineers who made the Canadian Pacific railway possible and who had kept it abreast of the times in the matter of physical developnent. No one of wisdom or vision would accept the hopeless doctrine that democracy is a failure, but there was a noticeable and ever-increasing tendency to succumb to asphyxiating, high-sounding idealistic phrases. A phrase which should not be bandied about too much, said Mr. Coleman, was that of public ownership. This was not a question of principle at all, but a question of expediency. He maintained that without the stimulus of competition mankind would never have accomplished what it has. Competition between individuals, nations and races was responsible for the progress of the world. There was no sensible man who wanted to see more than absolutely necessary interference with private enterprise and the rights of the individual.

In an eloquent address, Rev. Dr. Pidgeon discussed education and its real object in bringing out all that was in a person and leading that person to devote his or her talents to the welfare of the community generally. Referring to Mr. Clubb's remarks about roads, Dr. Pidgeon caused a lot of laughter with the following statement: "My experience of Manitoba's roads is that they lend themselves more to dry than to wet conditions.

A. W. McLimont, general manager of the Winnipeg Electric Railway Company, spoke of the immense power possibilities of the plant which the Manitoba Power company is constructing at Great Falls, which will produce 170,000 horse power available for absorption. Mr. McLimont said that what Winnipeg needed was an abundance of cheap power, as that would bring in capital more industrial enterprise and more population.

"Hydro-electric power has built up Montreal, Niagara and many other places, and it will do the same thing for Winnipeg," said Mr. McLimont. "We believe that Winnipeg, with its additional hydro-electric power, will attract industries that will not only make this a great manufacturing district but the great metropolis of the Canadian northwest."

Notes of Winnipeg Meeting

Those not present missed a real treat.

Congratulations to the Winnipeg Branch executive and committees for they deserve great credit.

Hats off to the Winnipeg Branch. They are not only jolly good fellows but are great entertainers.

The blue automobile pennants were an innovation for an engineering gathering which could well be adopted for all future meetings.

The souvenirs distributed by the Manitoba Power Company, and the City of Winnipeg Hydro-Electric System will serve as lasting reminders of a day well spent.

President Sullivan, while advocating municipal ownership under certain conditions, made it clear that he was not committing the Institute to any such policy.

George Guy, the zealous one-hundred-per-cent-efficient, always-on-the-job, Branch secretary radiated good nature and enthusiasm and cheered the visitors with his joyous spirit.

J. G. Legrand, when the registration officers pinned the second badge of his lapel, remarked that such a display of colour and gilt and tinsel reminded him of a St. Jean Baptiste parade.

The engineers of Manitoba are doing much to place the engineering profession on a higher pedestal of public recognition, the result of which was particularly notice able to those from outside points.

The large electric sign in front of the city hall, "Welcome Engineering Institute", was an external evidence of the city's greeting, while the civic officials in person gave evidence of a hearty welcome during the entire convention.

Telegrams of regret were received from Vice-President Walter J. Francis, Vice-President H. G. Acres and Councillor A. C. D. Blanchard, expressing regret at their inability to be present and extending greetings to their fellow engineers.

The committee investigating the deterioration of concrete in alkali soils held a full day's session on Monday, September 4th, at which a report was received from Doctor Thorvaldson, in charge of the investigation, and plans for future activity were discussed. An excursion was made to the field operations being carried on by the Winnipeg section of the committee.

Once more again —

We're all here together,
We're all here together.
Tell the world we're here again,
We're the engineering men.
Da-Da-Da-Da-Da-Da-Da.

General Professional Meeting

Winnipeg, Man., September 5th, 6th, and 7th, 1922.

The Mechanical Working of Iron and Steel

An outline of Modern Rolling Mill Practice, describing the Processes in various types of Mills

I. Walter Buckley, A.M.E.I.C.,
Assistant Superintendent of Mills, Dominion Iron and Steel Company.

Paper read before the Cape Breton Branch, The Engineering Institute of Canada, May 4th, 1922.

The mechanical working of steel improves its quality by closing up cavities and by refining its crystalline structure and so has important functions apart from the mere reductions to form and size. In mechanical treatment a distinction has to be made between "cold working" and "hot working" of steel. Steel which is worked below the critical temperature is termed "cold worked steel", and when worked at a temperature above the critical point is termed "hot worked steel". (The critical temperature of steel is that point at which the carbon content dissolves to form a homogeneous mixture. It varies inversely as the carbon centent and is usually between 1,200, and 1,600, degrees F.)

Cold working causes permanent distortion, or strain, of the structure of the metal and the properties of the metal are deeply affected. The elastic limit, tensile strength and hardness are increased, while the ductility is reduced.

Hot working tends to mechanical refinement and, owing to the plasticity of the metal at the higher temperatures, the distortion due to working into shape does not produce permanent strain in the structure of the steel.

Three Methods of Mechanically Working Hot Steel

There are three practical methods of applying pressure to steel during mechanical working, viz; hammering, pressing, and rolling. Shaping steel by hammering and pressing is called forging.

Hammering was the first method employed by man in shaping the metals, and the first forging was done by hand hammers wielded by workmen. As far back as the middle ages, when some of the finest examples of the blacksmith's art were made, as shown on the many old cathedrals in Europe, a tilt hammer was in use, which consisted of a beam of wood heavily weighted as the striking end. Early in the last century the steam hammer was developed. The principle of hammering is that of an instantaneous application of pressure applied to a relatively small area. The strains set up are compressive and take place in a vertical direction in the region below the area subjected to the force of the blow.

The Forging Press

The forging press is an English invention dating from the year 1861. It consists essentially of a hydraulic cylinder supported by one or two pairs of steel columns which are anchored to a single base casting of great weight and strength. The pressure is applied slowly and is gradually increased to a maximum which may be maintained until the metal yields.

In practice it is found that the lowest pressure that can be employed, to be effective at a full forging heat, is about 1.25 tons per square inch, but the pressure employed in actual work will often reach 13.25 tons per square inch. Unlike the instantaneous application of pressure, as in the case of the hammer, the action of the press is so slow that a kneading of the metal takes place and the strain instead of being confined to the surface, penetrates deep into the steel.

The Rolling of Steel

The commanding importance of the iron and steel industry, is due to the strong ascendency of rolling mill practice. Beams and rails can no longer be produced in sufficient quantity and quality by forging. Of all the known methods of shaping iron and steel from the cast material, that of rolling has come to be the most extensively used, although not producing the best quality in certain classes of product.

An Englishman, named Henry Cort, developed this method of working iron as long ago as 1785, having previously, in 1784 invented the process known as "puddling", the importance of which has been considerably diminished since the invention of steel. He also invented the rolling mill by which the puddled bars of iron were rolled into bars.

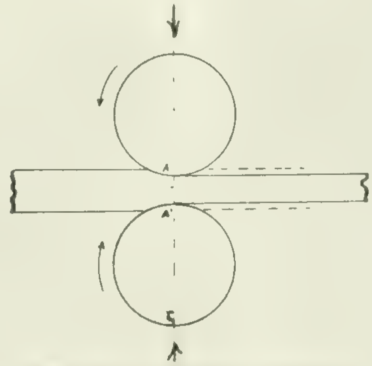

Figure No.1. Principle of Rolling.

The priciple of rolling is illustrated by figure No. 1. The two circles represent two plain motionless rolls which are being forced into the hot bar by means of pressure applied vertically. Vertical compression of the metal will occur at the points A and A', and a certain amount of metal will flow at the point of contact of the rolls and the bar will be elongated a little. If now the rolls are made to resolve in opposite directions, a second force is introduced, the result of which is to subject the bar to a longitudinal pull. The net result of this double action is to cause the metal to flow forward, reduced in size, and at a higher velocity than the steel entering the rolls or the peripheral speed of the rolls.

One of the most essential parts of a rolling mill are the rolls. These are carried in suitable housings, and so arranged that they can resolve, being positively connected

to the source of power, either the steam engine or the electric motor.

There are three parts to a roll; the body, the necks, the wobblers. The body is the cylinder part, plain or grooved, to suit the different kinds of work as may be required. The necks are the journals on which the roll revolves, they are carried in the chucks or bearings. The wobblers are the fluted ends of the roll which engage the coupling boxes, which are connected to the main drive.

Working of Iron in Rolling Mills

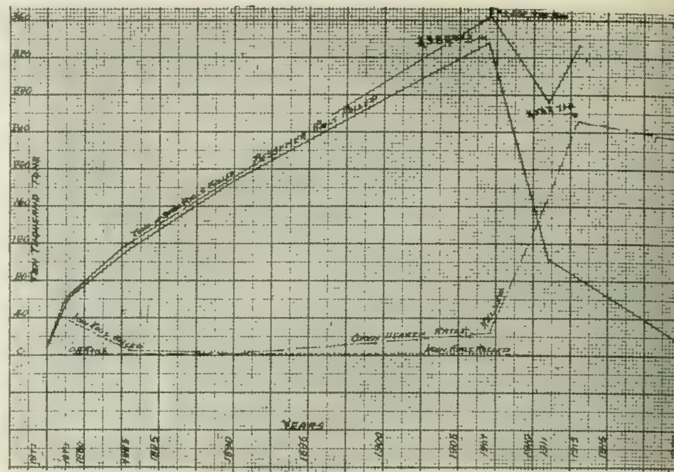
Since it was the working of iron that developed the rolling mill a short description of how this was done will be given.

Before steel making was discovered, iron was made in what was called puddling and bussling furnaces, in which a mixture of pig iron and scrap is worked in a suitable flame until a lump, (called a ball), of sponge iron is developed. This was hammered or squeezed out into the shape of a small slab, (called a shingle) and after again heating it is hammered or put through a pair of rolls running in opposite directions and made into a plate about three-quarters of an inch thick and six inches wide. These plates are used to make piles, that is, sandwiched between two of these plates is placed a quantity of miscellaneous scrap, such as nails, spikes, wire, etc., and the whole is tightened under a screw press and bound with hot wire. The pile is heated in the mill furnace and rolled into iron bars, sections, etc.

There are many plants still making puddled iron and scrap piles, rolling the same into iron bars, iron rods, chain bars, etc. They have a good market for their products owing to the fact that these have a greater resistance to rust and oxidation than steel bars, and on this account often command a better price.

Until 1877 more iron than steel rails were rolled, while in 1879 the production was:—steel rails 618,850 gross tons, iron rails 375,143 gross tons, and in 1883 steel rails 1,156,911 gross tons, iron rails 57,994 gross tons. From this date the production of steel rails shows a steady annual increase until 1907, when it was 3,632,729 gross tons. On the other hand the production of iron rails declined as follows:—in 1890 production was 13,882 gross tons, in 1907 production was 925 gross tons, and in 1911 iron rails ended with a production of 234 gross tons.

The accompanying curves show the production of iron and steel rails at different periods, illustrating how steel has supplanted iron, and also a comparison of the production of Bessemer and open hearth steel rails and iron rails. The production of Bessemer steel rails increased until 1907, when there were 3,380,025 tons rolled, and open hearth steel rails started climbing until open hearth tonnage passed the Bessemer tonnage in 1911. In 1913 open hearth tonnage reached its highest point when there were 2,527,710 tons rolled, and Bessemer 817,591 tons, while in 1920 Bessemer tonnage declined to 142,899 tons when 2,334,222 tons of open hearth rails were produced. A considerable part of the Bessemer tonnage now rolled is light rails.



Curves Showing Production of Iron and Steel Rails at Various Periods

Heating

Before steel can be worked hot it has to be heat treated in suitable furnaces, the design of which is a subject in itself.

The steel, in molten state, is poured into moulds of a uniform shape and size, convenient for working, to make ingots. These ingots are delivered to the rolling mills as soon as possible after pouring. Before they can be rolled the ingots must have been allowed to solidify throughout, and the whole mass should be of a uniform temperature. To get this result the ingots are charged in soaking pit furnaces, if possible, before the ingots have completely solidified. In cooling naturally these conditions are not fulfilled, because the outside of the ingot is the first to solidify, being the part from which the heat is removed most rapidly.

This fact was early recognized in rolling mill practice and it was originally the practice to strip the semi-molten ingots as soon as possible and place them in holes in the ground lined with refractory brick, where the heat from the centre was conveyed to the outside by conduction and the brickwork of the pit was also heated. This process was called "soaking", hence the name soaking pit.

In order to bring the soaking under better control and to make it adaptable to varying conditions, means for supplying additional heat were introduced so that the soaking pit developed into a combined soaking and heating furnace, hence the term soaking pit furnace. A very common type of soaking pit furnace is the four hole regenerative reversing furnace, capable of holding four ingots in each pit or sixteen ingots to the row, which is under the one control for gas and air, or under individual control as may be required by the heater. The ingots are charged into the pits in an upright position, the centre portion of the ingot in many cases being still molten they must stand in an upright position until this portion has become solid. The best practice demands they must be charged as hot as possible, so that they will reach the rolling condition with as little fuel for reheating as possible. Great injury can be done to steel during the heating process. It can be underheated, overheated, unevenly heated or worse than all, burned.

Different conditions of manufacture, and different grades of steel require different treatment in respect to temperature. The usual practice when three-ton ingots are charged soon after pouring, is to give them a reducing flame, (a jet of gas with hardly any air), until, the ingots begin to reach the stage known as "sweating". From personal experience this usually takes the same length of time as from pouring to charging in soaking pits, usually around thirty-five minutes. The gas and air is then shut off, the dampers closed, and the steel allowed to soak for about twenty-five minutes. Sufficient gas and air is then put on to bring the outside of the ingot to rolling temperature which is usually about 2,200 degrees F., for low carbon steel. The required time in the soaking pit furnaces is around one and one-half hours.

Mechanical Working

The ingot is the starting point for all mechanical working, and it will be interesting to mention the various processes that steel undergoes to produce the many articles for which it is used. Ingots after heating are made into:—large forgings; armour plate; sheared and universal plates; shaped blooms for large sections; slabs, which after reheating are rolled into sheared and universal plates; blooms, which are directly rolled into billets, which after being reheated are rolled into rods, bars, bands, hoops and small shapes; rectangular blooms, which are cut into required lengths and reheated to make rails, rail joints, structural shapes, sheet bars, skelp, from which on again being reheated are made tubes and pipes; forgings; cylindrical blooms, which after reheating are made into wheels, circular shapes and shell blanks.

The classification of mills, which comprise nearly all the rolling processes, is diagramatically shown by figure No. 2. There you will notice roughing mills which roll material direct from the ingot:—namely, blooming or cogging mills and slabbing mills rolling semi-finished products; then we have plate mills rolling a finished product.. Under the heading of finishing mills there are:—shape mills, rail mills, wheel mills, merchant mills, wire rod mills, pipe mills and sheet mills rolling from blooms, billets, sheet bars and slabs, making the following finished products:—beams, channels, angles, zees, tees, splice bars, rails, car wheels, gear blanks, bars, bands, hoops, cotton ties, small sections, wire rods and wire mills products, seamless tubing, black sheets, eye bar flats, universal mill plates, sheared plates, skelp, which is used for making welded pipe.

As a preliminary step to the forming of steel into the various sections which its many uses require, the heavy ingots are first roughly reduced to much smaller size of simple section, except in the cases of plates and heavy structural shapes. This preliminary work is done in a blooming mill, (called a cogging mill in Europe), owing to the type of drive used in the earlier mills. There are various types of this mill in use, but the common practice is to use either a "two high reversing" or a "three high continuous". Blooming mills, owing to the necessity of heavy and rough work, are the largest and strongest used to roll steel. Most mills of recent construction have rolls of 40 inches in diameter.

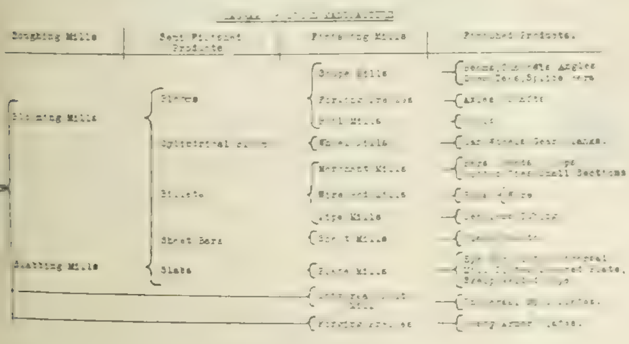


Figure No. 2.

In the two high reversing mill, the top roll is turned slightly larger in diameter so that the bar will always tend to turn down towards the table. In the reversing type of blooming mill the two rolls revolve in opposite directions. The large pass, being the first one the ingot of steel is delivered to, is made the same width as the small side of the ingot, and collars are provided to guide the ingot.

The ingot is drawn from the soaking pit with the aid of a special type of crane and delivered to the rolls delivery table, and the operator brings it to the rolls and with the aid of a manipulator, he can place it opposite any desired pass. (In passing it may be mentioned that most rolling mills have tables made up of revolving rollers, these can be operated in either direction at the will of the operator.) He moves the ingot and adjusts his rolls to give it the following work.

In the first pass with heavy drafts he reduces it until it is small enough to enter between the collars of the next smaller pass. He gives it a quarter turn and breaks it down in the second pass until it is of suitable size to be edged into the third pass, making the ingot smaller and smaller in cross section, until the desired size is reached. All passes except the last or finishing pass are usually given a swell on the roll, this helps to work the corners better and prevent corner troubles. A fillet at the base of the collars keeps the corners rounded and prevents them cracking. All passes are roughened or knurled to enable them to bite; the smaller passes being ragged a little deeper.

Each time the ingot passes through the rolls it is elongated and the bar gets longer and longer until a three-ton ingot will be about thirty-one feet in length when rolled down to an 8″ x 8″ bloom. This bloom is run down to the shears on the tables and cut into the desired lengths. An average life of these rolls is about 80,000 tons of rolled blooms.

Rail Mill

The working down of a hot bloom into rails will be given for the description of a heavy section mill as this is typical of many similar sections and probably of more local interest, owing to rails being a very important product of the Sydney plant.

The bloom which was described as rolled down to an 8″ x 8″ section in the blooming mill is transferred to the rail mill where it is charged into a reheating furnace for heat treatment. This furnace is of a continuous type, which means that the hot steel enters at one end and is delivered at the other. The temperature of the bloom on entering the furnace is about 1,900 degrees F., and when delivered is raised to 2,200 degrees F., and at

a soaking heat. It is then sent to the rail rolls where it is smashed down as shown in figure No. 3.

The bar only gets one pass in the finishing rolls, which are specially made of chilled iron so that they will give longer wear and hence more tonnage. The finished section has to be maintained reasonably smooth and very accurate in size. When the rolls wear this condition cannot be maintained and they have to be taken out and sent to the roll shop where they are dressed and made to template size again. Two thousand tons is considered very good tonnage after each dressing.

After leaving the finishing pass, the rail is delivered to the hot saw where it is cut into the standard lengths. The hot saw is a circular coarse tooth saw, 42 inches in diameter and running at a speed of over 1,500 r.p.m., and must cut all the rails square all the time. The rail is hot-straightened on its way to the colling beds, which are levelled so that when the rail is cold it is reasonably straight. When the rails are cold they are sent to the finishing mill where they are chipped, cold-straightened, and drilled for the bolt holes. The inspection is very rigid. They are all individually examined on all sides, tested for length and squareness of the ends, and then shipped on cars to the customer.

The rolling of steel into shapes and bars and the designing of the roll passes requires a considerable amount of skill and experience. Constant attention is required when rolling steel to avoid overfills, underfills, fins, laps, guide marks, pickups, or any other rolling defects.

Fins are caused by a section being too large for the pass it is entering, causing the metal to flow out bteween the collars. These fins will fall over and cause laps in the following pass. Guides and guards are used in order to prevent collaring and to insure that the piece enters and leaves its pass in the correct position. Guards are devices employed mainly on the delivery side of the mill to control the direction of the piece after leaving the pass.

The Rolling of Steel in Continuous Mills

To illustrate the rolling of steel in continuous mills, the case of making 1¾-inch square billets, 30 feet long, direct from the ingot at one heat, will be taken. To make 1¾-inch billets direct, the ingot is rolled down in the blooming mill to a 5″ x 5″, the top part is cropped off at the shears, and at the same heat the bloom is delivered into the continuous billet mill rolls.

The billet mill at the local plant is a 16-inch Morgan mill, this consists of six stands of rolls running at variable speeds, driven by a train of gears connected to an engine. The principal of this type of mill is that the 5″ x 5″ square section bloom is edged up diagonally, and entered into the first set of rolls, which have a diamond pass. The cross section is now reduced to a diamond, and travelling on is twisted with the aid of guides enough to give it a quarter turn by the time it reaches the second pass, where it is smashed down to a smaller square. The speed of each successive set of rolls is made faster, so that the reduced section travelling at a higher velocity will clear the same volume of metal that the first set of rolls is delivering. This will be explained by reference to figure No. 4.

Each of the circles represents a revolving roll, which in practice is made to revolve slightly faster than actually required, so as to impart a certain amount of tension between the different sets of rolls. This is a continuous application of the principle shown in figure No. 1, illustrating the principal of rolling.

The same process is carried on with No. 3 and No. 4 sets of rolls, No. 3 pass being a smaller diamond, this is twisted up so that it is edged in No. 4 and a still smaller square is delivered. The square bar coming from No. 4, being again reduced, enters No. 5 diamond and is delivered and twisted up on edge to enter No. 6 finishing pass, which is a square pass, making the bar 1¾ inch square. This is cut up into suitable lengths while still travelling, with the aid of a flying shears. The ingot is then in the six sets of rolls and the shears simultaneously. Entering the first set it is twenty-five square inches of cross section and on being delivered on the colling beds at only three square inches of section, a reduction of 88 per cent.

The velocity of steel delivered from each pass in feet per minute is as follows: No. 1 pass 91; No. 2 pass 114; No. 3 pass 177; No. 4 pass 221; No. 5 pass 344; No. 6 pass 427.

Wire Rod Mill

The application of continuous rolling is used with very good effect in rolling No. 5 gauge wire rods, which are the basic product of the wire mills. Wire rods are rolled direct from 1¾-inch square billets. There are reheated in a special continuous furnace made wide enough to take 30-foot lengths.

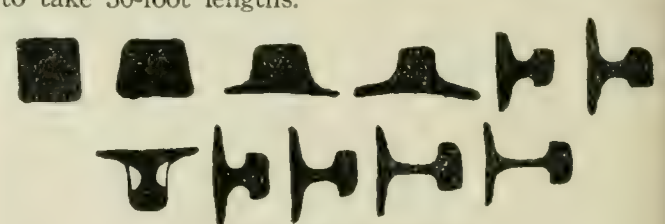

Figure No.3. Rolling Rails.

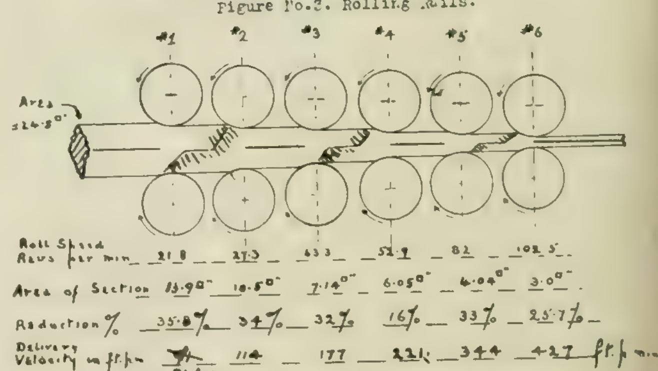

Figure No.4. Principle of Continuous Rolling.

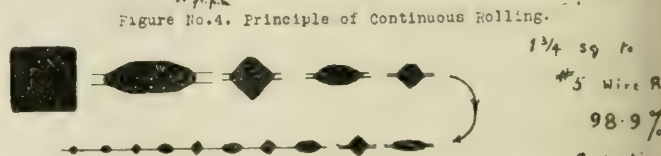

Figure No.5. Passes of Continuous Rod Mill.

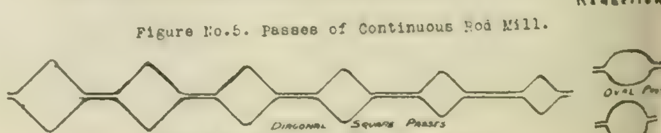

Figure No.6. Passes of Merchant Mill.

In the Morgan rod mill there are fourteen stands of rolls. The billets are fed into this train direct from the furnace. The principle is the same as with the working of the continuous billet mill already explained. The 1¾-inch billet is smashed down in a series of ovals and squares until the last pass where it is made into the small finished round, the bar being twisted up in alternate stands to give the oval a quarter turn before entering the following square. The rod is delivered from the finishing pass at a very high velocity, and is reeled into bundles ready for the wire mill. The velocity of the rod when leaving the finishing pass in the local mill is 2,678 feet per minute, and in the later type of mills is much greater. In the Morgan mill two strands of rod are rolled through the mill at the same time. Chas. H. Morgan of Worcester, Mass., developed this type of mill to its present perfection. He elimated the vertical rolls of the earlier mills, by twisting the hot bar in special guides, to give it the necessary quarter turn to edge the oval.

The passes of the continuous rod mill in diagramatic form are shown in figure No. 5.

Merchant Mill

As typical of merchant mill practice the case of rolling some 1½-inch guide round bars which are required in 16-foot lengths, will be taken. The first thing to consider is the size and weight of the billets required to roll them from. There are several considerations to take into account when ordering these. Allowance must be made for loss of scale in furnace and rolls, usually about two per cent, and the weight must be arranged to suit the length of bar leaving the finishing pass so as to give multiples of the required length with very little discard. In this case it would take 49 feet which includes one foot for crops at 6 pounds per foot which means 294 pounds. To this weight allow 6 pounds for scale loss, this brings the weight of billet to be ordered up to 300 pounds.

The size of the billet is governed by the size of the first pass in the roughing or breaking down rolls, say 5″ x 4″, and these are ordered from the blooming mill where they are rolled as previously illustrated and cut into 300 pound lengths.

The billets are reheated in the merchant mill furnace and rolled down in the roughing stand as follows: The first passes are usually of the box type and the 5″ x 4″ is smashed down to a 4″ x 4″ in the first pass; to 3″ x 4″ in the second pass; and to 3″ x 3″ in the third pass.

It is then taken to a second stand of strand rolls which are usually a series of diagonal squares, smaller and smaller, as shown in figure No. 6. The bar is given a quarter turn at each pass so that all the corners will get worked on. It is then taken to the stand with the leader pass or oval. This pass is made of exact size and shape, which is determined by experience, so that the bar delivered from this free from overfills or laps will exactly fill the finishing pass which of course is a perfect round 1½-inch in diameter. The same rolls are often laid out so as to make it possible to roll many similar sizes without changing rolls.

In rolling small shapes on the merchant mill a similar procedure has to be gone through and the hot billet would probably be worked down as shown in figure No. 7.

Sheet Bar

In rolling blooms, billets and small slabs the piece is held to dimension not only by the shape of the groove but also by edging the piece in certain of the passes. In rolling sheet bar the thinness of the piece will not permit edging after it leaves the roughers. A form of closed box pass called the tongue and groove pass is used. A groove corresponding to the width of the piece desired is cut into one of the rolls, while a tongue cut in the opposite roll fits into the groove, the sides of the latter being cut at a slight angle to the bottom. The tongue closes the pass on the remaining side.

Owing to the heavy drafts taken, the metal is squeezed up into the clearance between the tongue and the edges of the groove thus forming a fin on each side of the pass unless precautions are taken to prevent it. These fins are prevented from forming by making fillets in the groove and so arranged that the rounded edges formed by the fillets enter the succeeding pass opposite the openings formed by the clearance between the rolls. In this way a fin is avoided because the spreading of the metal merely fills out the round corner of the bar leaving no excess metal to be squeezed up between the rolls. The bar is finished in plain rolls which are always chilled iron rolls.

Figure No. 8 illustrates the manner in which the bloom is usually worked down. Owing to different conditions of temperature of the bar going through the finishing rolls, it is sometimes necessary to have a man stationed at these rolls to adjust the screw up and down, to suit the temperature of the bar in order to keep the thickness uniform. Sheet bar is all approximately eight inches wide and varies in thickness to give weights from seven to forty-three pounds per lineal foot. In exceptional cases it is made in twelve and fourteen-inch widths, for heavier sheets. After a mill is once set for rolling sheet bar the different weights of bar are obtained by adjusting the rolls heavier or lighter as the case may be. Steam jets and water sprays must be used on both surfaces

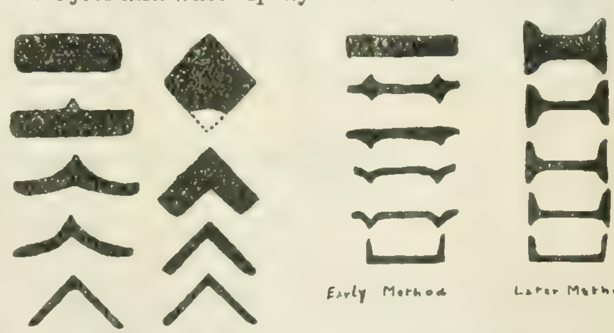

Figure No.7. Rolling Angles and Channels on Merchant Mill

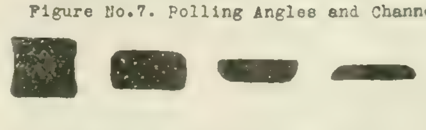

Figure No.8. Rolling Sheet Bar.

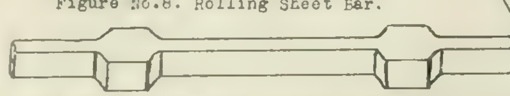

Figure No.10. Irregular Bar Witherow Steel Co.

Figure No.9. Irregular Sections

of the bar at every pass, it being absolutely necessary to produce a smooth surface on sheet bar. When sheet bar is rolled on continuous mills, vertical edging rolls are used in place of the tongue and groove pass. The vertical edging rolls control the width.

Rolling of Deformed or Irregularly Shaped Sections

A typical section of this kind is a deformed tie plate as shown in figure No. 9. The arrow shows the normal direction of rolling, but it could also be rolled in the other direction at right angles to the arrow. This tie plate would probably be rolled from an 8″ x 8″ bloom. It would be rolled down in eight or ten passes to a rectangular section with a thickness of approximately equal to that of the ultimate section over the lugs, the final form being obtained entirely in the last pass. This means that in the last pass certain parts of the bar are given very large reductions and the other parts are reduced very little. This condition requires a considerable flow of metal in some of its sections, if the section is to be kept uniform. The operation is in reality one of die forming, and a low speed is required to get this effect.

The Witherow Steel Company, Pittsburg, now make deformed bars, tie rods, automobile axles and shafts, in their rolling mills. The process has been termed continuous die forming. The rolls are in segments which, when assembled upon a mandrel, form segmental rings. A simple type of a bar which they roll is shown in figure No. 10. The bosses on this flat bar are spaced in equal distance around the pass of the roll. The wear of the pass is dressed up by taking out the ring segments. Automobile axles are now rolled this way, the circumference of the roll varying to suit the different die forming sections.

Re-rolling Rails

Used rails from the railroads and mill seconds are the raw material for this work. These are heated in continuous furnaces and then handled in two ways: (1) They are rolled down to smaller sections to supply the demand for pit rails; (2) They are split into three parts, head, web and flange, by passing through a set of splitting rolls and these three parts are then separately rolled into angles, concrete bars, splice plates, steel ties, fence posts, etc. There are eighteen re-rolling mills in the United States and at the Sweet's Steel Company, Williamsport, Pa., they use seven passes for working a 135-pound rail down to a 35-pound, or 125-pound rail down to a 30-pound, or 100-pound rail down to a 25- or 20-pound, or 85-pound rail down to a 16-pound. These involve reductions of seventeen to twenty-one and one-quarter per cent per pass. Two additional passes are required in working 100-pound rail to 12- or 16-pound with reductions of twenty-one and eighteen and one-half per cent per pass.

The splitting rolls have cutter collars and have five passes to accommodate the different size rails that may have to be split. The cutter collars function for months without redressing.

Working of Iron in Rolling Mills

A new mill recently put down in Belgium for making and rolling iron contains seven puddling furnaces working a mixture of pig iron and scrap. The sponge is carried to the steam hammer where it is shingled and at the same heat is rolled in the forge train into a 6½″ x ½″ bar. Piles are made of the faggoted box type with miscellaneous scrap, rods and crop ends piled between the two plates and pressed together and bound with hot wire.

The mill furnaces are made of the combination type, that is, gas producer and furnace combined. The mill consists of two trains of rolls; the first train, directly driven from the engine, is a 16-inch three high stand of breaking down rolls, running at 80 r.p.m., while the second train consists of six 10-inch three high stands driven with a rope drive from the flywheel of the engine at 240 r.p.m.

Twenty passes are required to roll the 6½-inch piles down to ⅝-inch rounds: nine passes in the breaking down rolls; three in the roughing rolls; four in the second stand; two in the third stand; one in the oval, and one in the finishing rolls.

Finished bars, about 100 feet long, are delivered at about ten feet per second, and the average output is about twenty-eight tons per eight-hour shift.

Considerations for a Road Policy

M. A. Lyons, A.M.E.I.C.,

Chief Engineer, Good Roads Board, Province of Manitoba.

Paper read before the General Professional Meeting, Winnipeg, Man., September 7th, 1922.

The roads and highways of any county hold a very unique position. They are entirely devoted to, and can be considered only from, the view point of "service". There is no other reason why there should be roads except to serve the public. Railways serve the public but up to the present they have not been constructed to serve unless there is a hope that they will at least pay their way. Street railways, power systems, telephone systems, water-works and other public utilities are expected to be paid for directly by those who enjoy these utilities; but roads are to be paid for by the public at large and seldom if ever by the people who use them in proportion to services received. In considering a road policy we must always keep before us that the whole aim of our policy must be one which will give the greatest value in *service*. This *service* is not for any one group of people, — not for the farmer alone or for the manufacturer; not fo the man with a team or the man with the automobile not for the worker alone or the pleasure seeker; bu *service* to all who wish to use the road.

Importance of the Road Question

Before giving consideration to some underlying prin ciples in selecting a road policy it may be well to brin out some facts which will emphasize the importance of th road question, and in so doing it will be compared wit that utility with which it can best be compared, th railway. Looking up the railway statistics for the yea 1919, we see that in that year the railways carrie 111,487,780 tons of freight, which cost the owners 27 million dollars in freight charges. The Dominion Commi sioner of Highways has estimated that about fifty per cent c

this freight was at one time or another hauled over rural roads, and an analysis of the type of freight which made up this tonnage would bear out this estimate. It must also be kept in mind that there is a large amount of material moved over rural roads which does not reach the railways. It would therefore appear that this estimate is on the low side. The Commissioner also estimates that the average length of haul on rural roads was 7.6 miles and the average cost of hauling at least 35 cents per ton-mile. Allowing 56 million tons moved, we find that the cost of hauling this material on roads was about 149 million dollars or about 54 per cent of what was spent for freight on the railways. In 1919 the railways carried 48 million passengers at a cost of 96 million dollars and making about 3.6 billion passenger-miles. We have no records of passenger travel on roads and can only estimate again, but we know that in 1921 there were 463,848 automobiles registered in Canada. Allowing an average of two persons per car and that each car travelled 5,000 miles per year we find that automobiles made 4.6 billion passenger-miles, a considerably greater passenger-mileage than the railways. Allowing 10 cents per automobile-mile, we find that the cost of moving passengers on roads was about 232 million dollars, which is greatly in excess of money spent on railway passenger travel. This does not take into account traffic by other vehicles on roads. These figures, while only estimates, show two things, — first, that the subject of roads is important enough to warrant a careful study for, and the putting into effect of, a comprehensive road policy; and second, that the amount of service rendered to the public by roads is as great, if not greater, than that rendered by the railways.

Up to the end of 1919 we find the capital invested in railways in Canada to be over two billion dollars. To this must be added the capital expenditure of over 413 million on government railways and nearly 24 million on provincial railways making a total capital of about two and one-half billion dollars. The Dominion Government aided other than government railways to the extent of nearly 222 million dollars; the provinces over 43 million and municipalities over 16 million. They have had land grants of over 44 million acres and bonds guaranteed to the amount of 344 million dollars. These figures show the value which the public of Canada has placed on this utility which performs a service similar to that performed by the roads, but whose utility and investment would be of no value without the service given by the roads. While the railways perform a service, this service is paid for by the users of the railways and the utility is expected to pay at least interest on the money invested therein. Roads have no opportunity to show a balance sheet and must therefore depend entirely on *service* for justification of their construction.

Divisions under which a Road Policy should be Considered

The consideration of a road policy falls into two divisions: 1st, executive; 2nd, financial. Under "executive", we must first consider who will have charge of the roads. Will they be constructed and operated privately or by public bodies. This question has already been answered for us and it seldom enters our mind that they could possibly be operated by private corporations in competition with each other, although if they were operated in some such way our highway system would be in much better shape than it is to-day. It has been determined for us that they are to be under the control of some public body. Of these there are in general three bodies, who are in a position to assume this duty; (1) the Federal Government, (2) the Provincial Government, (3) the Municipal Government. To put roads under control of the Federal would in some cases probably require changes to the British North America Act.

In a railway, where the haul is inter-provincial, it is essential that one central body should have control of a complete system. In roads it is not essential that there should be one central body in control throughout the Dominion. Freight hauls and passenger travel on roads, on the average, are over short distances as compared with the railways, and a large percentage of both of these originate and terminate within one province. There remain the other two bodies: the provincial and the municipal. The first means one central organization, the second means a large number of small organizations. In order to discuss which type of control would be better let us examine what is required of the road.

Types of Traffic

As the purpose of the road is service, we must know to what type of traffic we are to render service and what it requires. It is evident that the road must be constructed to suit the traffic, (within reasonable limits), instead of expecting the traffic to suit the road.

The first two divisions to be made are; (1) serving a well developed district and, (2) serving a new district. The traffic in the developed district will be outside or through traffic, and local traffic. The through or outside traffic will consist of strangers to the road and those more or less familiar with the road and will consist nearly all of motor traffic. The local traffic will consist largely of team-drawn loads with some, (and rapidly increasing), motor truck loads, automobile traffic, (mostly of the district), and some light team traffic. The traffic to be served under the heading of "new districts" will be mostly local traffic consisting chiefly of team-drawn loads, and a very light motor traffic.

What service is required by the stranger to the road? If he is a stranger to our country he may be on a tour intending to cover a considerable distance, and will be interested in passing through the country from one city to another along main highways. The impressions which he retains of our country will depend on the enjoyment which he obtains from his trip. He probably will have a schedule laid out which he wishes to follow. To serve him the road must first of all be safe under all conditions. It must be well marked so that he may follow it at anytime with certainty and ease of mind. It must be passable at any time during the travelling season. It must be a fairly direct route from city to city and must connect up with similar roads in adjoining provinces. Road laws must be the same throughout. A similar service is required by the man who is more or less familiar with the road. To this man, safety, directness and passable conditions of the road are most essential as he will undoubtedly be driving more at night than will the stranger; and in many cases a saving in time due to

directness of route means actual dollars to him. In addition to the service required by the stranger he will require more highways, reaching more cities and towns. The roads to serve these two classes must be designed primarily for automobile traffic.

What service is required of the road for local traffic? The traffic will consist of team-drawn loads from farm to market, and from town to town; some truck loads mostly from town to town with a chance that there will develop a motor truck traffic from farm to market. There will be auto traffic from farm to town and from town to town partly for pleasure, partly for business. There will be light team traffic, school vans on some roads, and some roads will be mail routes. For team-drawn loads the road surface should be passable in any sort of weather. It should be so that the cost of transporting the load is a minimum. It should be safe under all conditions; and should be direct. For truck loads it is even more important that the roads be passable at all times. Grades are not so important as for teams but directness of route is more important. Local auto traffic demands a road safe at all times but perhaps, is not so much concerned if the road should not be first class for a few days at a time. School vans demand that the roads be in good condition at all times during the school term and especially is a safe road required for this class of traffic. The postal routes must be safe and passable at all times.

Summing up for this division of traffic it appears: First, there are three classes of traffic and consequently three classes of roads; (1) "through" traffic requiring "through" roads; (2) town to town traffic; and (3) farm to market traffic. This latter including school van routes and probably postal routes. Summing up the service which each class of traffic requires we see that all require safety; mostly all require that the road be passable at all times; next directness of route; next light grades; and then a well marked route. To all these classes there should be added the pleasure seeker or the man who is out for recreation only and who desires to see the beauty spots of the country. He is interested only in roads which are safe and passable at all times and which run through the prettiest portions of the country.

The requirements in a district being opened are quite different from the older settled district. Auto traffic will be comparatively lighter and team-drawn vehicles will constitute the greater portion of traffic. The total volume of traffic will be light and speed not such an essential item. The road ditches in many cases must serve for draining the country. The service required by a road in this country is such as to justify a much cheaper type of road than in the older districts, but nevertheless it is a very important service which they must render.

So far we have considered roads from the view point of the person who uses the road. We must also consider it from the view of the man who pays for the road. If he is a *payer* and not a *user*, in the majority of cases he does not want to spend any money on roads. If he is a *payer* as well as a *user* he wants the money spent in the manner to give the maximum value, and he wants to know where and how the money is spent.

Executive Requirements

Having considered the service requirements of the different types of traffic let us see what is required of the executive to provide this service, — evidently a competent organization and money. To give the service required by those using the road the organization must consist of men who have knowledge of how to produce the results required, and the man who pays requires that the organization consist of men who can produce the results economically. To quote partly from the Commission of Highways for Canada, the organization must consist of "– – men who have had the training and experience to meet the problems which arise – –" and who "– – have been imbued with the public service idea and the necessity in the public interest of expecting one hundred cents in the dollar in value of workmanship and materials – –". This organization is expected to be capable of gathering engineering and economic data, correlating it, applying it, and filing it; of looking after the carrying out of construction; and as fully important, if not more so, of looking after maintenance; of seeing and knowing that work is properly done, money properly expended and that accounts and records are properly kept. To do this, the organization must have men of several types of training.

Some of the data to be gathered consists of facts about the amount and type of traffic which now uses the road; facts which will govern the change in volume and type of traffic which will use the road, when it has been improved, and in the future; facts regarding the cost of construction and maintenance of different types of road, the amount and kind of service which they will render under different traffic conditions; engineering data which will enable him to design the proper type of road and bridges to render the service required; facts regarding the costs of construction and maintenance; facts regarding the different methods of carrying out work and the use of different machinery and materials. The gathering of this data requires a man with a certain sort of training. The keeping of accounts requires another type of training. Men are required with office training for detail office work. The organization of the staff and keeping it running requires a certain type of training, as well as the man who has the general direction of the carrying out of the policy and relating it to the public. Evidently then, men of several different types of training are required for an efficient organization. To give the service which was stated as required by different types of traffic we know that safety requires a smooth, even surface, a proper cross-section, strong culverts and bridges, protection of high fills, and clear view, and for through roads, uniformity. To be passable at all times means generally some type of surfacing and the proper type of surfacing for the traffic. Both of these require immediate, constant and uniform maintenance.

Where Control Should be Placed

With control in one large central body an organization can be constructed of the men with the different types of training required to give the proper service. Continuous safe roads will be constructed, marked and maintained in a uniform manner. Proper machinery can

be purchased in larger quantities and at opportune times. Gravel pits and stone quarries can be purchased for present and future use. Work can be planned and arrangements made for carrying it for some time ahead and in proper order. Authority and uniform laws can be authorized by legislation easier to one body than a great variety of laws to a large number of bodies. Arrangements for financing the work can be easier and better made. The cost of the work can be properly placed when it has once been decided how the costs shall be borne. On the other hand the provincial organization offers a greater chance for manipulation by politicians. There is an opportunity in a large organization for a large waste of funds and for over organization. The members of the organization may not take as keen an interest in the work as might members of municipal organizations. Provincial Government organizations are generally bound by fair wage schedules in having any work carried out.

Municipal organizations are free of control by provincial politicians. They are more intimately connected with the work and there is less chance of a squandering of funds. There is a probability of a keen interest being taken in the work on account of their intimacy therewith. They are not bound by fair wage schedules but free to obtain labour on an open market at competitive prices. They have intimate knowledge of the local requirements for roads. They can generally get work done cheaper by local labour in small portions than can the larger organizations. On the other hand, they cannot build up an organization of men with the different types of training required. Continuous and uniform roads will not be constructed; each municipality will construct roads according to its idea, often with no regard to continuity and sometimes each councillor will construct his own peculiar type of road in his own ward. One municipality will have safe roads and the next very poor roads. Proper machinery for construction and maintenance cannot always be purchased. Large gravel pits for future use will not likely be reserved. Materials cannot be purchased at such an advantage. Roads will not be as uniformly marked. Raising of money will be more difficult and allotting of costs cannot be so fairly done. Records will not be so well kept.

These are some of the things to be considered in deciding how the roads are to be controlled. There are also several forms of dual control which might be considered. The province to have control of some roads and the municipalities of others. The control might be under the municipality subject to certain control and approval by the province, or vice versa; and all shades and varieties of these dual controls. It would be only under ideal conditions that dual control would work out satisfactorily. After the decision as to who shall have control comes the selection of the organization. Considerable space might be devoted to consideration of this. Once the organization is properly formed, a big step towards the success of the road policy has been taken. After this comes the method of construction. The selection of the type of roads and construction is a matter of engineering detail and once the right organization with sufficient authority has been formed, these can be satisfactorily worked out.

Financing of Roads

Coming to the financial question, this might be divided into three heads: (1) How much money should be spent yearly on roads; (2) how it is to be raised; (3) on what basis will the cost be distributed. The answer to the first question is beyond the knowledge of the writer, but it appears that by a proper study of wealth produced in this country, and from a study of value which might be received from good roads, that the maximum and minimum amount which should be spent on roads could be arrived at. This appears to me to be an immense question in itself, involving not only a study of present value which would be received, but also of future benefits which might accrue. This last includes a study of our material resources, probably methods of development as related to roads, and a study and plan of the whole future development of our country. This opens to us a vision of what the road question means when considered in its wide aspects.

The second question has been answered in many ways in different provinces and countries. The money must be raised from either, (1) current revenue; (2) term debentures; (3) capital account; (4) a combination of any two or more of these methods. The selection of which method should be used is a study in itself and should be decided by men of training in financial matters who are familiar with the various factors that determine which method should be adopted. The method that would be satisfactory in one section of the country might not be satisfactory in another. If members of a community had the opportunity to loan money in small sums at a higher rate of interest than they could borrow in large sums, it might be better to borrow money for roads. This might be the case in one community and not in another. If money can be borrowed at a time when one bushel of wheat will get one dollar and paid back when one-half bushel of wheat will pay off a dollar, it might be of advantage to borrow. In a new district it might pay to borrow money to improve the roads and open up the country for settlement and the increase in wealth produced might repay several times over the money required to pay back the debt. No attempt will be made here to solve this question but merely point out that the road question is not one of simply pushing up earth with a push grader, but is one requiring the services of men of a variety of training and experience.

The third question, "On what basis will the cost be distributed," offers another field for considerable study in order to arrive at an equitable solution. In most public utilities those using the utility bear the cost; but others besides those using the roads receive benefits. The land owner who has a good road constructed by his land is receiving benefits from the road even if he lives miles away, his farm not under cultivation, and the road never used by him. It seems reasonable that he should share some of the cost of the improvement, and that the whole cost should not be carried by those using the road. If a good road tends to reduce the cost of marketing produce or enables the gardener to get his produce to the consumer in a fresher state surely the consumer is securing some benefits. If a good road enables children to get to school where otherwise they could not, who can place the benefits which may be received from the

results of the education of a child which may become the leader in our country.

The first consideration which comes to mind is, should the money be raised and the cost assessed by Federal, Provincial or Municipal Governments. It is not clear to my mind why the Dominion Government should undertake the financing of road building. The people must pay and they pay no less by paying it through the Dominion organization rather than some other. The sources of Dominion revenue are not directly connected with roads and the public services which are under Dominion control are not directly interested in roads except the postal and military services, so that the raising of money by the Federal Government appears to have no direct connection with road service nor is the money likely to be spent on roads which directly affect Federal services. However, those who are interested in this phase of road financing can undoubtedly supply adequate reasons why the Federal Government should assist in financing road construction. On the other hand the Provincial Governments obtain revenue from sources which receive service from roads, such sources as automobile license fees, direct taxes on land values, direct taxes from those who haul loads over the roads. The municipal source of revenue includes direct taxes on land values and on those who are the main users of roads. It would appear to the writer that the financing of road construction should be a function of the Provincial and Municipal Governments.

As the money must be provided by the individual, in the final analysis we must give consideration as to how the cost is to be distributed to the individuals. This might be done on the basis of ability to pay or on the basis of benefits received. While taxation on the basis of ability to pay might be a fair basis for certain government services, it does not appear to be equitable that this should be the only basis on which to secure revenue for road construction. In general, public utilities rendering similar service are paid for on the basis of service received and this appears a fair basis for obtaining a greater portion of the revenues for road construction. Its equitable application is difficult if not impossible. Those receiving most of the direct services are the users of automobiles, motor trucks, farm teams, other team loads, light teams, school vans and mail routes. The majority of automobiles and motor trucks do most of their travelling on certain main highways and town to town roads, but they do some travelling on other roads; farm teams do most of their hauling on market roads but they do some on main highways and town to town roads; the landowner, we saw, received some value; the consumer of products receives some value; and the people at large receive some value. The question is in what proportion do they receive value from good roads. We assumed that the average motorist travelled 5,000 miles per year at a cost of 10 cents per mile. If the good road reduced the cost only ten per cent it would be worth $50. per year to him; but this is away low in the saving which will be effected. In the first place you cannot run a car on poor roads for less than 15 cents per mile; secondly, the saving will be much in excess of ten per cent in the cost of running the car, and thirdly, a saving of still greater value will be made in the saving of the time of the passengers. If automobiles were taxed $50. per year and this money put into proper roads they would, on the average, still be money in pocket. With half this money we would have a yearly road fund of over 11 million dollars from this source alone. We estimated that 5[illegible] million tons of freight were hauled over rural roads at a cost of 35 cents per ton-mile. If the cost were reduced to even 30 cents per ton-mile we would effect a saving of over 6 million dollars yearly. The average value of farm land in Canada is estimated at $48. per acre. Suppose good roads were established and the value of land increased by $5. per acre, the interest on this at 6 per cent is 30 cents per year or about 6 mills per acre. Suppose we ask only one-half this value to put into roads or 3 mills. The estimated value of farms and farm buildings in Canada is over 4 billion dollars. A rate of 3 mills would give another 12 million dollars yearly. If we asked each poll to contribute 10 or 15 cents per year for general value received we would add another million to our revenue, making a total yearly revenue of about 30 million dollars. We pay the railways directly over 369 million dollars per year. The point to be brought out is that there are several classes of beneficiaries from good roads; that consideration must be given to arrive at an equitable distribution of costs, mostly on the basis of benefits received; and that when these costs are distributed on this basis each person will be paying only a portion towards the value which he will receive.

It has been possible in this paper to point out only some facts which must be considered in deciding on a road policy. The main things which should be brought out are:

(1) That Service is the first consideration in a road policy.

(2) That the road problem is a large one and worthy of consideration by able men.

(3) That men of a variety of training, of broad experience and sound judgment should be requested to give their assistance in solving the problem of what should be a proper road policy for a country.

VOL. V. October 1922 No. 10

The Winnipeg Meeting

The Winnipeg Branch may well be proud of the successful outcome of the general professional meeting held there the first week in September. From the opening session it was stamped with the hall-mark of success which continued and increased until the final function. As one of the members remarked, having attended most of the engineering gatherings of recent years, "It seems wonderful that we can, with the fine meetings that have been held, show improvement each year, for the Winnipeg gathering is the best yet". This voices the sentiment that is representative of those present. Only those who have taken part in organizing such a meeting have any idea of the amount of detailed work involved or are in a position to appreciate the time and effort entailed upon the committees responsible. With a luncheon each day at noon and dinner at night, the programme kept the members together during the entire day, and afforded one of the best opportunities of getting acquainted that has yet been presented. Some of the papers read are notable contributions to the engineering literature of our time. The discussion at all times was indicative of an active interest on the part of those present, and the social functions were all that could be desired. The first public statement of the work of *The Institute's* committee investigating the deterioration of concrete in alkaline waters was made and appears elsewhere in this issue. This committee has done excellent work and it is anticipated that important results will be realized. To those not familiar with Manitoba, the water power development was a revelation, the facilities for visiting the new plants provided by the city of Winnipeg and the Manitoba Power Company being perfect.

The hospitable welcome by Mayor Fowler and the aldermen, the large electric sign which adorned the front of the city hall during the convention extending a welcome to *The Engineering Institute*, the newspaper comments and the distinguished guests at the banquet, all bore evidence, or paid tribute to the position the engineer occupies in the economic development of the country. The entire meeting was a splendid demonstration of the strength of the engineering profession, but above all it was a striking exemplification of the fact that the engineer is receiving greater recognition from those outside the profession.

It was an inspiration to read in the *Winnipeg Tribune* of Thursday, September 7th, the following editorial.

The Engineer

When the Waters were dried and the Earth did appear,
The Lord, He created the Engineer.

The fact that *The Engineering Institute of Canada* is in convention here makes the occasion opportune to pay a little tribute of praise to one of the most essential and one of the least appreciated of the professions.

Kipling, as usual, has told the story in a phrase. First of all comes the engineer — or at least, first after the explorer, and the engineer is frequently the explorer as well. Study almost any phase of modern life, and at the bottom will be found an engineer. When we learn to recognize the engineer, and value his services at their true worth, the world will make much more rapid progress and at the same time a great profession will come into its own.

Great trains shuttle back and forth across the continent, thundering their contempt for the roadbed that plays a humble but essential part in transportation. Somewhere a long time back an engineer hacked his way through the bush or tramped over the lone prairie, surveying the line. After him came another engineer, blasting and digging and filling until the roadbed was made and the steel laid. Other engineers were creating the machinery that constructed the locomotive and the cars, and they were made from steel. Engineers had found the iron ore, engineers had mined it, engineers had turned it into steel with the aid of chemical engineers and electrical engineers and many others.

We say casually that Canada has 18,000,000 available horse-power in hydro-electric energy. How do we know? Engineers of the hydrographic branch have been ranging the whole Dominion, measuring the

flow of rivers, many of them in the almost inaccessible fastnesses of the hinterland. Engineers first surveyed the course of the rivers, and when the time comes when hydro-electric development is possible on any of them, engineers will choose the site, engineers will construct the dams and the power-plants and the transmission lines. The development of the hydro-electric power of Manitoba is one of the greatest factors shaping the destiny of this province and its people. Engineers were essential at a hundred points in that great enterprise.

A great bridge costing many millions of dollars is to be erected. Engineering brains must figure the stress and strain on each little strut or girder, even each bolt in the structure. A highway is planned — engineers must figure gradients and drainage and materials and construction. A great building is to be erected, and engineering accuracy is called to find out what foundations are necessary. A city requires water, and the engineer is the man who finds it and brings it in and distributes it. Does concrete work crumble under the action of alkaline water? Turn to the engineer. What radiation is necessary to heat a space of 200,000 cubic feet? Ask the engineer. What is the wind stress against a great illuminated sign high in the air? Consult an engineer.

The engineer is the brains of construction and development. The capitalist supplies money, the workingmen supply labour, the management furnishes direction and initiative. The engineer's job is to say what can be done and how it can be done — and he must know, for guess-work is foreign to his nature.

His work is lost sight of by the public. It hardly knows that he is there, and never stops to think. That is one of the reasons why the profession does not stand as high as it should in the public estimation. Another reason is the fact that anyone who can screw two lengths of pipe together, or erect a flag-pole, thinks that he is entitled to call himself an engineer — and does.

An enlightened public opinion on this subject is much to be desired. The standards required before the title of engineer is conferred should be as high as the standards required for an "M.D." after a name.

It is a noble profession, and one of the greatest. Let us hope that greater recognition will come to it.

Employment Conditions Improved

For the past two years the employment situation in Canada has left much to be desired but it is gratifying to report that for several months there has been a gradual improvement to the extent that the situation is apparently better than it has been at any time for many months.

According to L. W. Wallace, executive secretary of the Federated American Engineering Societies, conditions are steadily improving, the outlook has grown more hopeful, and increased employment opportunities prevail rather uniformly in the major branches of engineering. The August report of the American Association of Engineers carries the same optimistic note, and while pointing out the labour difficulties, refers to the prediction that there will be considerable activity, increased production and increased work this fall. Dean Cooley, president of the Federated American Engineering Societies, has announced the purpose of the federation to formulate a permanent and constructive engineering policy as to unemployment which offers food for thought for *The Institute*, both in relation to a greater effort to insure, as far as practicable, continuity of employment and also to bring the engineering mind to bear on the subject of unemployment in general.

Suggested Code of Ethics

A joint committee under the chairmanship of Mr. J. G. Christie, consisting of representatives of the American Society of Civil Engineers, American Society of Mechanical Engineers, the American Institute of Electrical Engineers, the American Institute of Mining and Metallurgical Engineers and the American Society of Heating and Ventilating Engineers, has been working for some time with the object of drawing up a code of ethics that might be adopted by all of the engineering societies whose policy is to uphold the dignity and honour of the engineering profession. Correspondence between Mr. Christie and *The Institute* reveals the suggestion that *The Institute* consider the proposed code. Members will recall that the Committee on Policy recommended the appointment of a special committee, and at the last meeting of Council a committee consisting of Councillors Arthur Surveyer, F. P. Shearwood and Frederick B. Brown, was appointed to consider the proposal and report to Council. This committee is fortunate in having the work of the American societies' committee before them. The report of the joint committee together with the suggested code follows.

Report of the Joint Committee on a Code of Ethics for Engineers

The Joint Committee consisting of representatives of the American Society of Civil Engineers, the American Institute of Mining Engineers, The American Society of Mechanical Engineers, the American Institute of Electrical Engineers, the American Society of Heating and Ventilating Engineers, appointed to consider a Code of Ethics for Engineers recommends, after deliberate consideration, that each participating Institute or Society adopt the short simple Code of Ethics following this report.

The Committee further recommends that the following method of interpreting and administering the Code be adopted by each participating Institute or Society after any necessary provisions have been made in the Constitution and By-Laws of the organization.

"The President of each Society or Institute shall appoint a *Standing Committee on Professional Conduct*, to administer the Code of Ethics. The duties of such a Committee shall be to interpret the Code and to render opinions on any cases of questionable conduct on the part of members that may be submitted to the Committee. These interpretations shall be reported to the Executive Board of the Institute or Society who may approve these interpretations, or take such other action as may seem just and necessary. The reports of the Committee on Professional Conduct when approved by the Executive Board, shall be printed in abstract *and in anonymous form* in the Institute's or Society's monthly journal for the instruction and guidance of fellow members.

This Committee on Professional Conduct shall be appointed in each Institute or Society by the President holding office at the time of the adoption of this Code and shall consist of five members, one appointed for five years, one for four years, a third for three years, a fourth for two years and a fifth member for one year only. Thereafter, the President then holding office shall appoint one member annually to serve for five years, and shall also fill any vacancies that may occur for the unexpired term of the member who has withdrawn. These appointments shall be made from among the older members of the Institute or Society, so that advantage may be taken of their nature experience and judgment. The Committee after appointment shall elect its own chairman and secretary. The Committee shall have power to secure evidence or other information in any particular case not only from the organizations own members, but if it should seem desirable, from men in other professions. The Committee may also appoint sub-committees to consider certain cases when deemed necessary.

This Committee shall investigate all complaints submitted to it *by the Secretary of The Institute or Society* bearing upon the professional conduct of any member and after the member involved has been given a fair opportunity to be heard, the Committee shall report its findings to the Executive Board of the Institute or Society. This report may in some cases suggest certain procedure of the Executive Board.

The Executive Board of the Institute or Society shall have power to act on the recommendation of the Committee on Professional Conduct, either (1) to censure by letter the conduct of the member who has acted contrary to the Code, if the breach is of a minor character, or (2) to cause the members' name to be stricken from the roll of the Institute or Society.

Copies of all reports made by a Committee on Professional Conduct to the Executive Board of each Institute or Society shall be furnished to each other Committee on Professional Conduct administering the

Code. This will keep each Committee advised of the interpretations of other Committees, and in time an extended interpretation of the Code can be written based on the reports of the various Committees on Professional Conduct.

As interpretations of the various Committees on Professional Conduct administering this Code may vary at times, it is recommended that the Chairmen of these Committees of the various Institutes or Societies be authorized to act as a Joint Committee to review such differing interpretations and to bring them into unity with one another."

Respectfully submitted,

Joint Committee on Code of Ethics

A.S.C.E.:— C. C. Elwell, A. M. Hunt.
A.I.M.E.:— J. Parke Channing, Philip W. Henry.
A.S.M.E.:— A. G. Christie, *Chairman;* J. H. Hinchey, Chas. T. Main, J. V. Martenis, Robert Sibley.
A.I.E.E.:— Comfort A. Adams, G. Faccioli, Geo. F. Sever, L. B. Stillwell.
A.S.H.V.E.:— Frank T. Chapman, S. A. Jellett, Perry West.

A Code of Ethics for Engineers

Engineering work has become an increasingly important factor in the progress of civilization and in the welfare of the community. The Engineering Profession is held responsible for the planning, construction and operation of such work and is entitled to the position and authority which will enable it to discharge this responsibility and to render effective service to humanity.

That the dignity of their chosen profession may be maintained, it is the duty of all engineers to conduct themselves according to the principles of the following Code of Ethics:

1. The Engineer will carry on his professional work in a spirit of fairness to employees and contractors, fidelity to clients and employers, loyalty to his country and devotion to high ideals of courtesy and personal honour.
2. He will refrain from associating himself with or allowing the use of his name by an enterprise of questionable character.
3. He will advertise only in a dignified manner being careful to avoid misleading statements.
4. He will regard as confidential any information obtained by him as to the business affairs and technical methods or processes of a client or employer.
5. He will inform a client or employer of any business connections, interests or affiliations which might influence his judgment or impair the disinterested quality of his services.
6. He will refrain from using any improper or questionable methods of soliciting professional work and will decline to pay or to accept commissions for securing such work.
7. He will accept compensation, financial or otherwise, for a particular service, from one source only, except with the full knowledge and consent of all interested parties.
8. He will not use unfair means to win professional advancement or to injure the chances of another engineer to secure and hold employment.
9. He will co-operate in upbuilding the Engineering Profession by exchanging general information and experience with his fellow engineers and students of engineering and also by contributing to work of engineering societies, schools of applied science and the technical press.
10. He will interest himself in the public welfare in behalf of which he will be ready to apply his special knowledge, skill and training for the use and benefit of mankind.

Secretary Rice Represents E.I.C.

Calvin W. Rice, whose remarkable success as secretary of the American Society of Mechanical Engineers is well known, was appointed by that society and several other engineering societies and organizations to represent them at the great engineering congress now being held at Rio de Janeiro. As Mr. Rice has always been a warm friend of *The Institute*, he kindly offered to act as official delegate, which offer was gladly accepted by the Council, so that at that important gathering *The Institute* will be well represented.

David Thompson

Explorer, Geographer and Scientist

How little we know of the great men who toiled unceasingly and endured untold hardship in the pioneer days of Canada's vast northwest. Only recently the people of Canada learned with astonishment that David Thompson, one of the country's foremost explorers, had died unnoticed more than half a century ago, within a few miles of Montreal.

On August 30th, 1922, a memorial to the late David Thompson was opened at Lake Windermere, B.C., and on the same day a memorial service was held at his graveside in Montreal. In this way, after many years, the passing of one of our most notable pioneers was told.

What is known of the life work of David Thompson is narrated in "An Appreciation" prepared by J. B. Tyrrell, F.R.S.C., on the occasion of the opening of the memorial at Lake Windermere, from which the following are extracts:—

"David Thompson was the greatest land geographer who ever lived; and, therefore, one of the greatest scientists. He came to Fort Churchill a 14-year-old boy from a London charity school in 1784. While his greatest work was being done during twenty-eight years, he was never within a thousand miles of any civilized community of five hundred souls. He died in obscure poverty sixty-five years ago and lies in a nameless grave at Montreal. The opening of the memorial museum and hall at Lake Windermere, B.C., is the first public recognition of the debt that civilization owes him, for, though the Thompson River is called after him, a few years ago not one geographical student in a thousand knew anything about him.

With extraordinary accuracy he placed on the map the main routes of natural travel in one million two hundred thousand square miles of Canada and five hundred thousand square miles of the United States; he surveyed the head waters of the Mississippi; he discovered a new route to Lake Athabasca; he opened the first trade between what is now Canada and the territory beyond the Great Divide; he fixed the locations of outstanding geographical points over this vast area with the sureness of an expert astronomer, though he had to learn how to figure with the stars when he was a boy wintering at Cumberland House on the Saskatchewan River.

His skill won for him the appointment of Astronomer to the Commission which, from 1816 to 1826, delimited the frontier between British North America and the United States. Some of his surveys are included in the official maps now being issued. His "Narrative," published in 1916, is a wonderful story of life in the wilderness and contains very much information of the prehistoric exlxtence of the Indians never given elsewhere. So far as is known, he is the only man who has ever surveyed the Columbia from source to mouth, 1150 miles. His locations are as accurate as others which have been made with the most modern instruments and the most recent almanacs that Government Departments can buy. The record of his work is contained in forty notebooks, which have long been in the possession of the Ontario Government. Their story, for unremitting labor, conscientious devotion to science, and for the unconscious evidence they give of a noble character, so far as a somewhat extensive research enables one to judge, is not equalled by anything that has been left by all the explorers whose names are honoured wherever our language is read.

I have called Thompson one of the greatest of scientists. His work is open for inspection. It is the more remarkable because, not only was a great deal of it performed literally thousands of miles from the outskirts of civilization, but because, except for one year, it was a side-line to his activity as a fur trader, first for the Hudson's Bay Company and then for the North-West Company, which afterwards was united with it. He travelled almost incessantly during spring, summer and fall — often most hazardous travel, such as is told in the journal of his opening of a new route to Lake Athabasca, during which he was almost drowned, and was within a few hours of death by starvation.

The remains of his Fort Kootenae are just outside the town of Athalmere. The degrees of latitude are located as from Greenwich. Thompson's log house here was six thousand miles from Greenwich, to com

municate with which, in his day, required several months of travel. Thompson's location of this place by his observations of the stars was within four miles of its precise spot on the earth's surface. His location of Cumberland House is within one mile of exactitude — nearer than the Capitol at Washington was placed by the foremost scientists up to the time when the Atlantic cable brought Washington into instantaneous communication with Greenwich Observatory.

Thompson toiled in the wilderness without thought of the public distinctions that usually incite scientific men. He never learned to advertise. He suffered privation in his old age without a murmur. With a noble humility he exemplified the Christian virtues during nearly thirty years in the wilderness, where not a single missionary had ever been. For what he did and what he was he deserves to be held in everlasting homage."

Approval of Cement Specifications

The standard specification for Portland Cement issued by the Canadian Engineering Standards Association under the date of February 22nd, 1922, being a revision of *The Engineering Institute's* specification, was approved by the Council at the August meeting.

OBITUARY

Major Robert W. Powell, M.C., A.M.E.I.C.

News of the death of Major Robert W. Powell, M.C., A.M.E.I.C., of Ottawa, while engaged in engineering work at Bay D'Espoir, on September 4th, has been received with deep regret by his many friends within the profession. Born in Ottawa on October 11th, 1891, he received his primary education in the public schools and Collegiate Institute of that city, later attending Royal Military College, Kingston, from which he graduated in 1911. After graduating, Major Powell was engaged for a short time on railway location work for the Canadian Northern Railway, and in the same year he accepted the position of assistant to the superintendent, St. Charles River Import Works. In March 1912, he was appointed as assistant engineer in the Public Works Department at Ottawa, and the following year joined the staff of S. J. Chapleau, M.E.I.C., in the same department. Major Powell's war record was outstanding. He joined the Canadian Engineers in September 1914 as Lieutenant in the 4th Field Company, and was Adjutant of the 4th Divisional Engineers during mobilization, later being transferred to the 11th Field Company. He was wounded three times during 1916 and won the Military Cross and Bar to Military Cross. In 1917 he was returned to Canada and was appointed chief instructor of the Engineers Training Depot at St. Johns, Que., where he was promoted to the rank of Major. At the end of the war he was appointed assistant engineer for the Department of Railways and Canals on section No. 3, of the Welland ship canal, on which work he was engaged from March 1919 until the end of 1920. He then became interested in hydro-electric power investigations, and it was on this branch of work that he was engaged near Bay D'Espoir, Newfoundland, when he died.

PERSONALS

E. E. Down, A.M.E.I.C., is with the Department of Public Highways of the province of Ontario, as instrumentman on work near Simcoe, Ont.

Alec. W. Barnes, A.M.E.I.C., has returned from England, where he has been for the past six months, and is now located in Edmonton, Alta.

Morley V. Powell, S.E.I.C., has accepted a position as demonstrator in the thermodynamics laboratory, of the Faculty of Applied Science, University of Toronto.

W. S. Collins, Jr.E.I.C., is with the Manitoba Power Company at Great Falls, Manitoba, where the new hydroelectric power plant is being installed for this company.

J. LeRoy Underhill, Jr.E.I.C., of Campbellton, N.B., is now located at Montpelier, Vt., with the State Highway Board in connection with the roads work for the State.

R. H. Farnsworth, Jr.E.I.C., is with the St. Lawrence Paper Mills Limited, at Three Rivers, Que., where he is engaged in design work for the company.

H. L. Humes, S.E.I.C., who graduated in metallurgical engineering from McGill University last spring, is now on the staff of the university as Fellow in Metallurgical research.

T. W. Brown, A.M.E.I.C., who until recently has been located in Saskatoon, Sask., has opened an office in the McArthur building, Winnipeg, where he is engaged in engineering and general contracting work.

G. R. Elliott, A.M.E.I.C., is with Cosden and Company at Tulsa, Oklahama, engaged in geological field work in that state. Mr. Elliott is a graduate of the University of Toronto of the class of 1911.

Alf. A. Oldfield, A.M.E.I.C., has been appointed engineer of maintenance of way, and assistant to the manager of the Eastern Wisconsin Electric Company, of Oshkosh, Wis., U.S.A.

S. Eastman Root, S.E.I.C., is with the Thompson Starrett Company, at Three Rivers, Que., on the engineering staff on the construction of the mill of the St. Lawrence Paper Mills Limited.

T. L. Crossley, A.M.E.I.C., is supervisor of education in English, of the Institute of Industrial and Domestic Arts, Department of Pulp and Paper Making, which is located in Toronto, at 208 King Street, West.

T. C. Thompson, Jr.E.I.C., of Montreal, is on the staff at McGill University as demonstrator in electrical engineering. Mr. Thompson received his degree of B.Sc. from McGill in 1920.

E. E. Holmes, S.E.I.C., of Westmount, Que., is now connected with the St. Lawrence Supply Company, Ltd., Montreal. Mr. Holmes is a graduate of McGill University and has until recently been on the engineering staff of the Wayagamack Pulp and Paper Company.

C. J. Lacy Sanderson, A.M.E.I.C., of Acme, Alta., has been appointed to the staff of the district engineer and surveyor for the government of the province of Alberta at Calgary, Alta., and is in charge of a survey party engaged in locating new roads in that district.

John Pinder-Moss, Associate E.I.C., has been appointed director of the Northern Polytechnic Institute of British Columbia at Prince Rupert, B.C., into which institute has been merged the Granby Bay Polytechnic of Anyon.

Kenneth M. Ramsey, S.E.I.C., of Montreal, who graduated this year from McGill University, has been appointed production engineer with the Thompson Starrett Company, at Three Rivers, Que., on the construction of the new mill for the St. Lawrence Paper Mills, Ltd.

George B. Dorey, A.M.E.I.C., formerly assistant mechanical engineer of the Hart-Otis Car Company, is now with the Enterprise Railway Equipment Company of Chicago, Ill. Mr. Dorey had been connected with the Hart-Otis Car Company since 1907 with the exception of two years on military service.

Dudley J. Shrimpton, S.E.I.C., of Westmount, Que., is with the Ford Company, at Windsor, Ont. Since graduating in mechanical engineering from McGill University in 1920, Mr. Shrimpton was on the staff of the mechanical engineer of the Steel Company of Canada, prior to accepting his present position.

W. N. Ryerson, M.E.I.C., formerly general manager of the Great Northern Power Company at Duluth, Minn., has recently resigned to join the management department of Day and Zimmermann, Inc., engineers, of Philadelphia, Pa., which firm operates eighteen public utility properties in the eastern states, including electric light and power, gas, and electric railway enterprises.

Alan Ferrier, A.M.E.I.C., has been appointed to the staff of the Technical Branch of the Canadian Air Force and is located in Ottawa. Mr. Ferrier is a graduate of McGill University having received his degree of B.Sc. in 1920 and following graduation he was employed with T. Pringle and Son Ltd., engineers and architects, Montreal.

H. L. Vercoe, M.E.I.C., who was in 1919 resident engineer in charge of construction of the new power plant for the Manitoba Power Company at Great Falls on the Winnipeg river and later inspecting engineer on the Grand Trunk Railway arbitration at Winnipeg, is now with the Appalachian Power Company, Engineering Department, at Bluefield, W.Va.

Thomas Shanks, M.E.I.C., D.L.S., acting surveyor general, is at present on a trip throughout western Canada, for the purpose of visiting some of the surveyors who are on active field service and conferring with some of the provincial officials over some of the problems closely identified with the work of the Topographical Surveys Branch, Department of the Interior.

D. Roy Paterson, Jr.E.I.C., of Galt, Ont., is located at Morpeth, Ont., having recently joined the staff of the Webster Construction Company, of London. On returning from overseas in 1919 Mr. Paterson was articled on D.L.S. work in Saskatchewan, and later was appointed assistant city engineer of Galt, Ont., from which position he resigned in May of this year to join the company he is now with.

Frederick H. Fay, M.E.I.C., is the senior member of the firm of Fay, Spofford and Thorndike, consulting engineers of Boston, Mass., which firm has recently announced that they have admitted to partnership, Messrs. John Ayer, Bion A. Bowman, Carroll A. Farwell, Ralph W. Horne, Ralph T. Jackson, George L. Mirick, Barzillai A. Rich, Warren D. Trask, who have been long associated with the firm. The name of the firm is to remain as heretofore.

John F. Bell, O.B.E., R.N., M.E.I.C., has recently retired from the Royal Navy and is now resident in Toronto. Mr. Bell was born in Carlisle, England, and received his engineering training at City and Guilds Technical College, London, Greenwich Naval Engineering College, and by private tuition. He entered the Royal Navy in 1898 and after rapid promotions entered the war period as Engineer Lieutenant Commander, and was later promoted to Engineer Commander, retiring this year as Engineer Captain.

Major General Garnet B. Hughes, C.B., C.M.G., D.S.O., M.E.I.C., is now located at 175 Piccadilly, London, W. 1., where the firm of G. B. Hughes and Company, Ltd., is engaged in public works contracting. After graduation from R.M.C., in 1901 General Hughes was for a number of years engaged in railway work in various parts of the country as assistant to the chief engineer of the Canadian Northern Railway. He was for two years, general superintendent in charge of construction of the Cia de Augua y Drenaje de Monteerey, Mexico, in connection with water-supply and drainage work. Following his distinguished service overseas he became, at the close of the war, managing director of the British Cellulose and Chemical Manufacturing Company, Ltd., at Spondon, near Derby, England.

F. Theo. Gnaedinger, A.M.E.I,C., formerly secretary-treasurer, Sault Ste. Marie Branch, is now located in Three Rivers, Que., having accepted the appointment of resident engineer for T. Pringle and Son, Limited, of Montreal, in charge of certain changes which are being made at the plant of the Wabasso Cotton Company. Mr. Gnaedinger graduated from McGill University in 1912, and during the same year was employed on construction work and field engineering with the Algoma Steel Company at the Soo, with which company he had previously been employed during his college course. In July, 1912, he was appointed field engineer of the Lake Superior Paper Company, now the Spanish River Pulp and Paper Mills, Limited. In 1913, he was engaged on hydro-electric power investigation for the Mond Nickel Company, and in the two succeeding years was resident engineer on the construction of the power development at Nairn Falls. At the close of the war, during which he served in the Canadian Railway Troops, he entered the employ of the Algoma Steel Corporation on the construction of the new combination rail and structural mill, which position he held until coming east to take up the new work on which he is now engaged.

Recent Visitors at Headquarters from out of town

D. W. McLachlan, M.E.I.C., Ottawa; Chas. W. Dill M.E.I.C., Winnipeg; W. H. Breithaupt, M.E.I.C., Kitchener C. G. Moon, A.M.E.I.C., Ottawa; K. M. Cameron, M.E.I.C. Ottawa; J. L. Rannie, M.E.I.C., Ottawa; J. W. Roland M.E.I.C., Halifax; Frank B. Thompson, S.E.I.C., Toronto P. Manning, A.M.E.I.C., Peterborough; C. R. McCort A.M.E.I.C., Three Rivers; Ernest Lavigne, A.M.E.I.C. Quebec; M. Wolff, A.M.E.I.C., Ottawa; W. A. Winfield M.E.I.C., Halifax; B. J. Saunders, M.E.I.C., Halifax; Frank P. Vaughan, M.E.I.C., St. John; B. A. Yandall, A.M.E.I.C. Kirkland Lake.

EMPLC

MEM ...HANGE

To make this department more valuable it is proposed that in future advertisements of situations vacant should state salary, and give details of requirements.

Situations Wanted

Mechanical Engineer

Engineer, Jr.E.I.C., age 24, seven years experience mechanical drafting, designing and engineering, including supervision over manufacture of special machinery, design of tools, jigs and fixtures for the manufacture of iron working machine tools, railways motors and controllers, improvement of lathes, shapers, drills, etc.; desires change. Salary expected $165 per month. Apply Box No. 119.

Position desired in South America

Institute member desires position in South America, having had six years experience there, and understands the language. Has experience in railway work and construction, also experience as a sales engineer. Apply Box No. 116-P.

Situation Vacant

Principal Statistical Clerk

A Principal Statistical Clerk (Male), in the Mining, Metallurgical and Chemistry Branch, Dominion Bureau of Statistics, Department of Trade and Commerce, Ottawa, at an initial salary of $1,800 per annum, which will be increased upon recommendation for efficient service at the rate of $120 per annum, until a maximum of $2,280 has been reached. This salary will be supplemented by whatever bonus may be provided by law.

Duties. — To perform difficult, highly specialized work of a clerical nature involved in the collection, compilation, checking, correction and tabulation of statistical data; editing of data obtained from chemical industries, with a view to establish correctness of details; preparation of reports relating thereto; correction and compilation of data with regard to special inquiries, and other related work as required.

Qualifications. — Education equivalent to graduation in chemistry from a university of recognized standing; at least two years' experience in industrial chemical work; supervisory ability; considerable knowledge of modern office methods. Candidates are requested to forward with their applications any diplomas or certificates received by them, or certified copies of such, which may have a bearing on their qualifications for this position. While a definite age limit has not been fixed, age may be a determining factor when making a selection.

Application forms properly filled in must be filed in the office of the Civil Service Commission not later than October 12th. Application forms may be obtained from the offices of the Employment Service of Canada, from the Postmasters at Prince Rupert, Vancouver, Victoria, Edmonton, Calgary, Regina, Winnipeg, Quebec, Charlottetown, Halifax, Fredericton, and St. John, or from the Secretary of the Civil Service Commission. By Order of the Commission, W. FORAN, *Secretary*.

ELECTIONS AND TRANSFERS

At the meeting of Council held on September 25th 1922, the following elections and transfers were effected:—

Members

Condon, Frederick Oxley, district engineer, Canadian National Railway, Moncton, N.B.

Fogarty, Orville Alden, engineer, Pennsylvania Mold and Iron Corporation, Pittsburgh, Pa.

Howard, Rupert Fortescue, B.Sc. (McGill Univ.), consulting engineer, 416, Phillips Place, Montreal, Que.

Lash, Norwood Maxwell, (grad. S.P.S. Toronto), chief engineer, Bell Telephone Company of Canada, Montreal, Que.

McKenna, John Andrew, B.Sc. (Mech. Eng. — Mass. Inst. of Technology), senior asst. engr. and controller of military lands, Engineer Services, Major C.E., O.C. 3rd field Company, Canadian Engineers.

Nash, Thomas Sanford, D.L.S., in chg. of a major divn. of Topog'l. Surveys Branch of the Dept. of the Interior, Ottawa, Ont.

Associate Members

Babcock, Harold Austin, B.A.Sc., (Univ. of Toronto), with James, Proctor & Redfern, Toronto, Ont.

Bailey, Harold Milton, supt., Public Works and Utilities, Town of Melfort, Sask.

Bannantyne, Ninian, senior engr., H.M.C.S. "Aurora", Halifax, N.S.

Bennett, George Arthur, B.A.Sc. (C.E. — Univ. of Toronto), chief of party, Topog'l. Surveys Branch, Dept. of the Interior, Ottawa, Ont.

Bisson, Joseph Leonard, B.Sc. (C.E. — McGill Univ.), senior asst. engr., Dept. Public Works, Canada, at Fort William, Ont.

Boulton, William James, B.A.Sc. (Univ. of Toronto), chief of party, general surveys, Topog'l. Surveys Branch, Dept. of the Interior, Ottawa, Ont.

Bradley, Nicholas Hilburn, D.L.S. & A.L.S., asst. to dist. surveyor and engr. Surveys Branch, Dept. Public Works, Alta.

Brenot, Lucien Edward Honore, D.L.S., chief in chg. of party on topog'l. and land classification surveys, Ottawa, Ont.

Fenner, Thomas Henry, editor, "Power House" and "Marine Engineering of Canada", Toronto, Ont.

Forde, Elroy, Lt.-Col., D.S.O., asst. director of signals for Canada, Dept. of Militia and Defence, Ottawa, Ont.

Gladman, Victor Lionel, B.Sc. (McGill Univ.), chief engr., Sproatt & Rolph, Archt's., Toronto, Ont.

Hardouin, Joseph, D.L.S., in charge of party topog'l. survey work in Southern Alberta, of Ottawa, Ont.

Hill, Percy Pridmore, dftsman., engr'g. dept., Montreal Public Service Corporation, Montreal, Que.

Hutton, Lionel Alfred Bennett, inspector of telegraphs, C.P.R., Calgary, Alta.

May, Alex Harvey, B.A.Sc. (E.E. — Charlottenburg Univ.), consltg., elect'l., mech. and genr'l. engr., Walkerville, Ont.

McCloskey, Michael D'Arcy, D.L.S., chief of party, Topog'l. Surveys Branch, Dept. of the Interior, Ottawa, Ont.

McDougall, Samuel G., B.A.Sc., (Univ. of Toronto), civil engr., specializing in physical appraisal work, Ottawa, Ont.

McElhanney, Thomas Andrew, B.A.Sc. (Univ. of Toronto), asst. controller of surveys, Topog'l. Surveys Branch, Dept. of the Interior, Ottawa, Ont.

McKay, Robert B., B.Sc. (Queen's Univ.), surveys engr., Topog'l. Surveys Branch, Dept. of the Interior, Ottawa, Ont.

Melville, James Learmonth, Capt. M.C. and Bar, Unit Director of Administration for Eastern Ontario, D.S.C.R., Ottawa, Ont.

Paoli, Ambrose Aloysius, B.Sc. (Queen's Univ.), of Kingston, Ont.

Richmond, John, B.A.Sc. (Univ. of Toronto), chief of inspection, laboratory dept., Northern Electric Co., Montreal, Que.

Ross, Joseph Hope, acting Principal, Provincial Institute of Technology and Art, Calgary, Alta.

Slipper, Stanley Eades, B.Sc. (Queen's Univ.), petroleum engr., Mining Lands and Yukon Branch, Dept. of the Interior, Calgary, Alta.

Steers, Francis Paul, D.L.S., engr. (in charge, detailed topog'l, survey of City of London), Ottawa, Ont.

Thomas, Cecil Oldrieve, fuel engr., Montreal Light Heat & Power Company, Montreal, Que.

Watt, George Herbert, (Grad. S.P.S. Toronto), asst. office engr., in division of surveys information, Topog'l. Surveys Branch, Ottawa, Ont.

Westland, Clarence Robert, B.Sc. (McGill Univ.), geodetic engr., Geodetic Survey Branch, Dept. of the Interior, Ottawa, Ont.

Whillans, Thomas Oliver, B.Sc. (Queen's Univ.), asst. patent examiner, Canadian Patent Office, Ottawa, Ont.

Wilson, William Gillespie, asst. gen. supt. in charge of mills, Dominion Iron & Steel Co., Sydney, N.S.

Wrong, Frederick Hay, B.A.Sc. (Univ. of Toronto), asst. D.L.S., Topog'l. Surveys Branch, Dept. of the Interior, Ottawa, Ont.

Juniors

Fahey, James Vincent, B.Sc. (Queen's Univ.), hydrometric survey, hydraulic dept., Spanish River Pulp & Paper Mills, Ltd., Sault Ste. Marie, Ont.

Medlar, George Elmer, engr. in charge of field and office work for the Essex Border Utilities Commission, Windsor, Ont.

Murphy, Alexander Gordon Silcox, B.Sc., (McGill Univ.), of Westmount, Que.

Rickards, Charles Selby, meter engr., Abitibi Power & Paper Co., Iroquois Falls, Ont.

Transferred from the Class of Associate Member to that of Member

Beatty, James A., with Morrow & Beatty, Limited, Peterborough, Ont.

Black, Maurice W., (Grad. S.P.S. Toronto), chief engr. and managing director, Concrete Builders Limited, Fredericton, N.B.

Edwards, Harold, A.B. (Harvard Univ.), consltg. & constrn. work, President, Harold Edwards, Limited, Winnipeg, Man.

McLean, William Brown, B.Sc. (McGill Univ.), Vice Pres. and Mng'g. Director, Maple Leaf Manufacturing Co., Ltd., Montreal, Que.

Marrotte, Louis Henry, B.Sc. (McGill Univ.), asst. to chief engr., Montreal Public Service Corporation, Montreal, Que.

Pardoe, William Sprague, B.A.Sc. (Univ. of Toronto), Instructor and Asst. Professor in C.E., Univ. of Pennsylvania, Philadelphia, Pa.

Paulin, Frederick William, O.L.S., mn'g. director, Canadian Engineering & Contracting Co., Ltd., Hamilton, Ont.

Philips, Hector Somerville, engr. in charge sewerage design, City of Hamilton, City Engineer's Dept., Hamilton, Ont.

Smith, J. Warren, designing engr., Toronto Transportation Commission, Toronto, Ont.

Transferred from the Class of Junior to that of Associate Member

Auld, Robert Whyte, of Calgary, Alta., asst., location party (Dom. Govt.) N. Saskatchewan project.

Kendall, Ralph, constrn. engr., Dominion Coal Company, Glace Bay, N.S.

Parker, Irving Holman, supervising engr., Wm. I. Bishop, Ltd., and P. Lyall & Sons, (associated on Chambly Road Contract) Montreal, Que.

Whittaker, Herbert James, private practice, Calgary, Alta.

Transferred from the Class of Student to that of Associate Member

Brouse, Eldridge Dean Gooderham, B.A.Sc. (Univ. of Toronto), vice pres. and asst. mgr., Norman McLeod Limited, Engr'g. Contractors, Toronto, Ont.

Transferred from the Class of Student to that of Junior

Bishop, Trenholme Allen Gill, B.Sc. (E.E. — McGill Univ.), engr., engr'g. dept., Montreal Public Service Corporation, Montreal, Que.

Bowman, Nelson, B.A.Sc. (civil — Univ. of Toronto), complete chg. of erection of a concrete grain elevator and workhouse, Dominion Linseed Oil Co., Baden, Ont.

Dick, Victor William, B.Sc. (E.E. — Univ. of Manitoba), correspondent, detail division, Correspondence Dept., Canadian Westinghouse Co., Sales Dept., Hamilton, Ont.

Dunbar, John Robert, B.Sc. (E.E. — McGill Univ.), electr'l. engr., Canadian Westinghouse Co., Hamilton, Ont.

McLennan, Logan Seaforth, B.Sc. (McGill Univ.), of Vancouver, B.C.

Myers, Harold Raymond, of Stratford, Ont.

Robertson, Charles Forman, B.Sc. (N.S. Tech. Coll.), asst. to supervisor of mtce., Maritime Telegraph & Telephone Co., Ltd., Halifax, N.S.

General Professional Meeting, Winnipeg, September 5th, 6th, 7th, 1922

Visit to Great Falls Development, Manitoba Power Company, Ltd.

BRANCH NEWS

Lakehead Branch

Geo. P. Brophy, A.M.E.I.C., Secretary-Treasurer.

On September 12th, 1922, in the City Council Chamber, Port Arthur, Ont., with an attendance of over thirty persons, of whom sixteen were already members of *The Institute*, the *Lakehead Branch* of *The Engineering Institute of Canada* was organized.

The meeting was called to order by G. H. Burbidge, M.E.I.C., of the Department of Public Works, Canada, who was mainly responsible for the organizing of the Branch. Mr. Burbidge, in a short address, explained why a Branch of *The Engineering Institute of Canada* was needed in the Twin Cities and then called upon Fraser S. Keith, general secretary of *The Institute*, who had stopped off on his way east after attending the General Professional Meeting in Winnipeg, to address the meeting.

G.H. BURBIDGE, M.E.I.C.
Chairman Lakehead Branch.

Mr. Keith outlined the objects of *The Institute*, to promote the professional interests of its members, to facilitate the acquaintance and interchange of professional knowledge, to encourage original research, to develop and maintain high standards in the engineering profession, and to enhance the usefulness of the profession to the public. He also gave a short history of *The Institute*, showing how it has grown from a few branches in the east to Branches in every place of any size throughout the Dominion. He announced that the *Lakehead Branch* is the twenty-third Branch of *The Institute*. Mr. Keith's address was greatly appreciated by all and a vote of thanks was tendered to him.

Mr. Burbidge then asked R. L. Dobbin, M.E.I.C., of Peterborough, a member of this year's Council, to address the meeting. Mr. Dobbin, in a short address, outlined the organization and activities of the Peterborough Branch, which he was instrumental in forming, and passed on to the local members hints on the conduct of meetings. Mr. Dobbin's address was loudly applauded, and he also was tendered a vote of thanks.

The election of officers was then held and resulted as follows:—chairman, G. H. Burbidge, M.E.I.C., Port Arthur; vice-chairman, H. S. Hancock, A.M.E.I.C., Fort William; secretary-treasurer, Geo. P. Brophy, A.M.E.I.C., Port Arthur; and executive committee: J. Antonisen, M.E.I.C., and W. T. Moodie, M.E.I.C., for Port Arthur, G. R. Duncan, A.M.E.I.C., and D. G. Calvert, A.M.E.I.C., for Fort William.

Meetings will be held on the first Monday of each month alternately in Port Arthur and Fort William, the first meeting to be held in Fort William.

Mr. Keith then addressed the meeting again, urging the members to co-operate with the other clubs in the district to do a public service. He also emphasized the importance of making the meetings social, as well as technical, this being necessary to hold the interest of the younger members. He stated that the local Branch was in a good position to get in touch with prominent members of the profession who would be travelling east or west, and inviting them to stop off at the Twin Cities to address the Branch.

The following attended the meeting:—J. Antonisen, M.E.I.C., city engineer, Port Arthur; G. H. Burbidge, M.E.I.C., Public Works, Canada, Port Arthur; W. T. Moodie, M.E.I.C., superintendent C.N.Ry., Port Arthur; George Blanchard, A.M.E.I.C., Fegles Construction Company, Fort William; Geo. P. Brophy, A.M.E.I.C., Public Works, Canada, Port Arthur; F. C. Graham, A.M.E.I.C., Public Utilities Commission, Port Arthur; A. G. Jeffreys, A.M.E.I.C., Port Arthur Shipbuilding Company, Port Arthur; H. M. Lewis, A.M.E.I.C., Provincial Paper Mills, Port Arthur; D. G. Calvert, A.M.E.I.C., Fort William Paper Company, Fort William; G. R. Duncan, A.M.E.I.C., G. R. Duncan and Company, Fort William; H. S. Hancock, A.M.E.I.C., Hancock and Company, Fort William; J. C. Meader A.M.E.I.C., Ontario Government road engineer, Port Arthur; E. W. Robison, A.M.E.I.C., divisional engineer, C.N.Ry., Fort William; M. W. Turner, A.M.E.I.C., Fort William Paper Company, Fort William; H. D. Booker, Jr.E.I.C., Canadian Westinghouse Company, Fort William; Elijah Cowan, S.E.I.C., Port Arthur; C. D. Jones, Fegles Construction Company, Fort William; M. W. Jennings, C.N.Ry., Port Arthur; H. R. Crowell, Provincial Paper Mills, Port Arthur; J. L. Bisson, Public Works, Canada, Fort William; C. D. Howe, C. D. Howe and Company, Port Arthur; J. W. Boughner, Public Works, Canada, Fort William; William H. Souba, C. D. Howe and Company, Port Arthur; C. J. Moors, Telephone Exchange, Fort William; A. A. Mahon, Fort William; Oscar Johnson, Port Arthur; R. J. Askin, Fort William; Douglas Urry, Port Arthur; C. B. Symes, city engineer, Fort William, and our two guests, Fraser S. Keith, M.E.I.C., general secretary of *The Institute*, Montreal, and R. L. Dobbin, M.E.I.C., superintendent of waterworks, Utilities Commission, Peterborough.

Toronto Branch

C. R. Young, M.E.I.C., Branch News-Editor.

Activities of the Toronto Branch for the coming season are taking form and a profitable series of meetings is promised. The programme committee consisting of Wm. Storrie, M.E.I.C., chairman of the Branch; George T. Clark, A.M.E.I.C., and C. R. Young, M.E.I.C., is now at

work on the selection of a series of suitable topics for the meetings.

At a meeting of the executive committee held on September 12th, the resignation of F. B. Goedike, A.M.E.I.C., as secretary was received with regret. Mr. Goedike, on account of being employed outside Toronto, has found it impossible to discharge the duties of secretary for the coming session. Overtures are being made to obtain a suitable successor for him. The acting secretary was instructed to express the appreciation of the Branch to Mr. Goedike for his services during the past year.

The matter of obtaining a new lantern for the lecture room was left in the hands of G. G. Powell, M.E.I.C., to bring to the attention of the Engineer's Club, from whom the lecture hall is rented.

The report of the Committee on Policy was received and it was arranged that the regular meeting of the Branch on October 26th, should be given over to the discussion of this report. R. O. Wynne-Roberts, M.E.I.C., was asked to lead the discussion.

The attention of the executive was drawn by H. L. Seymour, M.E.I.C., to the fact that a committee of the Ontario Legislature is to take up this fall the question of consolidation of town planning legislation and that a committee in Toronto is engaged in drafting a town planning bill to be submitted to this parliamentary committee. The Branch was requested to interest itself in the movement and to this end it was agreed that the meeting of November 15th be given up to the discussion of the draft bill. Norman D. Wilson, A.M.E.I.C., was named to arrange the details of this meeting.

Niagara Peninsula Branch

R. W. Downie, S.E.I.C., Secretary-Treasurer.

On August 16th, the members of the Branch declared a holiday and gathered with their ladies at the Queens Royal at Niagara on the Lake. In spite of the heat the tennis courts and bowling green were thronged all afternoon. The bathing beach was an even greater attraction. Dancing in the pavilion brought a happy day to a close. The members are grateful to A. W. L. Butler, A.M.E.I.C., H. L. Bucke, M.E.I.C., and O. J. McCulloch, S.E.I.C., who were responsible for organizing the affair.

The executive have laid out an attractive programme for the winter including a trip over the power tunnels of the Niagara Falls Power Company, Niagara Falls, N.Y., and dinner meetings at Welland, Niagara Falls and St. Catharines at which papers of interest will be discussed. While the Branch has lost in membership as the Chippawa power project nears completion, increased activity on the Welland ship canal and the construction work generally in the district has in a measure compensated for this loss.

The question of legislation and registration in the new professional body for Ontario, is to be discussed at a dinner meeting in Welland in October and there is no doubt but that there will be a generous response from this Branch.

Hamilton Branch

W. F. McLaren, M.E.I.C., Secretary-Treasurer.

The Hamilton Branch opened the season with a dinner at the Royal Connaught, on Friday, September 15th, 1922, at 6.15 p.m., which was participated in by a large and enthusiastic body of engineers and their friends. Hon. F. C. Biggs, Minister of Public Works, was the guest of honour. Songs were indulged in during the evening, a verse being added to the song, "Old Macdonald had a Farm", the new words being:

> Old man Biggs built a highway,
> And on this highway he put a sign;
> "A detour here and a detour there
> And here a detour, there a detour,
> Here and there a detour".

Niagara Peninsula Branch Outing at Niagara-on-the-Lake.

"Next year," said Mr. Biggs, "I shall eliminate that word "detour", and simply say, "Development — this way around".

F. W. Paulin, A.M.E.I.C., was chairman, and stated that our meeting would be short to allow the engineers to hear the debate between J. H. Duthie, secretary of the National Waterways Association of Canada, and Senator George Lynch-Staunton of this city.

T. J. Mahony, of the Suburban Highways Commission made a brief address, and then Mr. Biggs took the floor, being welcomed with the singing of "He's a Jolly Good Fellow". The speaker stated that he had outlined and was consummating a scheme of highways which followed the old pioneer roads and which would touch every county and every county town in Ontario, and in which 90 per cent of the population live. In all there would be 1,824 miles of paved highway. The work was all being done by trained engineers presided over by a chief, who had three assistants, each supervising about 600 miles of roadway. These had other engineers under them and if a report was wanted on any section he could get it in an hour by telegraphing the engineer on that section. Ninety per cent of the engineers were returned men and even the inspectors were graduate engineers. He referred to the difficulties encountered in entering Hamilton from the west, where the five bridges had been built. The city was to pay 40 per cent, but insisted on paying $365,000 and no more. As the 40 per cent would have been $268,000, the city lost out on this deal.

Other difficult features met with were at "Clappison's cut" which was 1,400 feet long and 53 feet deep costing $138,000; the Ancaster road up the mountain, 30 feet wide, of which 20 feet would be paved and 10 feet macadam for horse traffic; the "Binkley subway" requiring 48,600 yards of excavation; Dundas street started in 1921, on which good headway had been made and a magnificent concrete bridge built over the Sixteen-mile creek. He referred to the bridge across the canal at Hamilton Beach as a big blunder because it was so narrow that it would have to be replaced in three years. Mr. Biggs referred to a bill he had introduced in the Ontario house for the "Capitalization of Motor Licenses". This will provide $2,000,000 a year, which will not only retire the debenture interest but will wipe out the capital cost of the highways in twenty years. The floating of new loans to wipe out old loans was poor financing and under the new bill this will not be necessary.

He stated that there were only twenty-three trucks in Ontario over five tons capacity and only one per cent over three tons. It is these heavy trucks that injure the roadway and one per cent of the traffic cannot be allowed to damage these expensive highways. From August 15th every truck has to carry a sign showing its capacity in tons. Inspectors are being sent out to watch these and any truck exceeding its limit will be required to immediately unload and will be prosecuted as well. Two trucks equipped with "loading meters" are being used for this purpose and if necessary more trucks will be employed on this duty. He referred to the congestion of traffic at Bridgeburg where he was recently help up by the traffic which was stalled for seven blocks. He was told he might get across in four hours but he preferred to go round by Niagara Falls. A bridge must be built there for the hundreds of thousands seeking to cross the Niagara river at this point.

The meeting closed with loud applause and a hearty vote of thanks to the Minister for his very instructive address.

Ottawa Branch

F. C. C. Lynch, Associate E.I.C., Secretary-Treasurer.

The following officers of the Dominion Government have been in attendance at the Eighth National Exposition of Chemical Industries, held in the Grand Central Palace, New York, during the week of September 11th, — F. G. Wait, chemist, Department of Mines; A. M. Beale, A.M.E.I.C., Dominion Water Power Branch; W. B. Stokes of the Dominion Forestry Service.

An important conference in the Lake of the Woods regulation matter took place in the office of the Prime Minister on September 20th, when Governor Preus of Minnesota, made certain representations regarding the attitude of his State. Governor Preus is a strong advocate of the early commencement of the St. Lawrence navigation and power project, which formed the subject matter of his address before the Empire Club in Toronto recently.

A distinguished visitor in Ottawa this week was Dr. W. H. Eccles, D.Sc., A.R.C.S., F.R.S., M.I.E.E., Dean of the University of London, vice president of the I.E.E., of the Physical Society and of the Institute of Physics, and vice chairman of the British Wireless Telegraph Commission. Whilst in Ottawa Dr. Eccles was entertained by the radio members of the Branch. The shortness of his stay rendered it impracticable to arrange for a luncheon or an address to the Branch.

With the establishment of the Department of Defence, the Department of the Naval Service disappears and the Hydrographic, Tidal Service and Radiotelegraph branches of the Naval Department have been transferred, together with all personnel and activities, to the Department of Marine and Fisheries.

A. M. Narraway, S.E.I.C., D.L.S., controller of surveys, has returned to Ottawa after completing a most successful and interesting trip through western Canada in connection with the supervision of the surveys of the Topographical Surveys Branch. His trip included a thousand-mile seaplane flight from Victoria Beach, north of Winnipeg, to a point about two hundred miles northeasterly on the Manitoba-Ontario boundary where he visited the camp of J. W. Pierce, A.M.E.I.C., D.L.S., at present engaged upon making this boundary survey, and thence across country to The Pas, Manitoba, and northwesterly to the camp of E. P. Bowman, A.M.E.I.C., D.L.S., engaged upon control traverse surveys. In addition to this, reconnaissance flights were made over a portion of the Manitoba-Ontario boundary yet to be surveyed and over the Churchill and Reindeer rivers. Mr. Narraway speaks very highly of the efficiency of the officials of the Air Board who arranged

and conducted the flight and the good work in forestry air patrol by officials of the Forestry Branch. In addition to the above Mr. Narraway visited the party engaged on the survey of the Alberta-British Columbia boundary, southwest of the Grande Prairie district, as well as a number of parties on the prairies in Saskatchewan and Alberta.

Lt. Col. L. T. Martin, D.S.O., M.E.I.C., was married on the 12th September to Miss Frances Kathleen Heney, of Ottawa. Col. Martin who is well known throughout Ontario is one of the Commissioners of the T. & N.O. Ry., and commanded the 7th Battalion Canadian Railway Troops for the greater part of the war in France. After a two weeks trip through the Adirondacks and the White Mountains Mr. and Mrs. Martin will take up residence in Ottawa.

Cape Breton Branch

Kenneth G. Cameron, A.M.E.I.C., Secretary-Treasurer.

The opening meeting of the winter session of the Cape Breton Branch was held in the Branch rooms on September 12th.

The Branch chairman, C. M. Odell, M.E.I.C., presided, and K. H. Marsh, M.E.I.C., chief engineer of the Dominion Iron and Steel Company, presented a most instructive and interesting paper dealing with the construction and operation of the blast furnace. He traced the development of the present day furnace from the early variety known as the Catalan forge through the various stages of increased height and hearth, with the introduction of the hot blast, the closed top, with the utilization of the waste gases.

Following a description of the various chemical reactions taking place between the materials of the burden during their descent through the stack, Mr. Marsh outlined the various difficulties which have arisen, and the manner in which they have been overcome. Many ideas have been, and are constantly being incorporated into the construction with a view to eliminating troubles and obtaining a better product with a smaller consumption of fuel. Mr. Marsh illustrated his paper with diagrams and photographs showing the different types, both past and present, and at the close of his paper answered numerous questions arising from the general discussion which took place.

In closing, the chairman extended the thanks of the members to the speaker for the trouble he had taken in the preparation and presentation of his paper.

Montreal Branch

E. A. Ryan, A.M.E.I.C., Secretary-Treasurer.

At a meeting of the Executive Committee held on August 3rd, Mr. Farmer submitted a report of an informal meeting with representatives of the American Society of Mechanical Engineers concerning the Spring meeting of that society which is to take place at Montreal in 1923. A special committee composed of Messrs J. A. Duchastel, George MacLeod and Fraser S. Keith, was appointed as representatives of *The Engineering Institute of Canada*, to co-operate with the local Meetings Committee of the A.S.M.E.

The chairman also read a letter from the secretary, J. L. Busfield, M.E.I.C., intimating that on account of his professional duties in connection with the Hydro-Electric Inquiry Commission of Ontario, necessitating an absence from Montreal of considerable duration, he felt it necessary to tender his resignation as secretary of the Branch. General regret was expressed at the need of accepting Mr. Busfield's resignation and in doing so the Executive Committee placed on record its "appreciation of the signal services rendered by Mr. Busfield during several years of increasing activity, to which his energy, initiative and untiring devotion to the duties of his office and to the interests of the E.I.C., were large contributing factors".

The Executive Committee held another meeting on August 31st, at which the new secretary-treasurer, E. A. Ryan, A.M.E.I.C., was appointed. His address is Room 703, Southam Building, 128 Bleury Street, to which communications for the Montreal Branch should be henceforth forwarded.

Saskatchewan Branch holds Summer Meeting at Moose Jaw, Sask.

OTHER SOCIETIES NEWS

Federated American Engineering Societies

The Bulletin of the F.A.E.S.

The first number of the new "Bulletin" of the F.A.E.S., was issued September 1st, 1922, and replaces the mimeographed bulletin, which has been distributed by the organization since the commencement of its work. The first issue is a credit to those responsible for its production, and provides eight pages of current news of interest to the members of the engineering organization which are members of the F.A.E.S. The purpose and policy of the Bulletin are set forth in the closing paragraph of an editorial in the first number, which is as follows:—

"From the formation of the Federated American Engineering Societies, three principles have guided its publicity work:

(1) All matter sent out must be informative and expository — never argumentative.

(2) No propaganda material can be permitted.

(3) No matter aggrandizing the Federated American Engineering Societies or any persons connected therewith can be permitted.

These three principles will be strictly applied in the publication of the Bulletin.

The ever-present purpose shall be to produce a publication worthy of 'an organization dedicated to the community, state and nation' and dealing with matters of 'public welfare wherever technical knowledge and engineering experience are involved'."

Representatives at International Congress

The Federated American Engineering Societies designated the following engineers as its representatives at the International Engineering Congress, which was held at Rio de Janeiro in connection with the Brazilian Centennial. V. L. Havens, editor Ingeniera Internacional, New York City; F. J. W. Luck, representative of F. H. Walker & Company, Rio de Janeiro, Brazil; Thomas T. Read, Bureau of Mines, Department of the Interior, Washington, D.C., Calvin W. Rice, secretary, the American Society of Mechanical Engineers, New York City. The congress opened on September 7th and lasted throughout the month.

American Society of Civil Engineers Appoints Secretary

At a recent meeting of the Board of Direction of the American Society of Civil Engineers, John Hoffman Dunlap, M. Am. Soc. C.E., professor of hydraulics and of sanitary engineering in the College of Applied Science, State University of Iowa, was appointed secretary, this office having been filled temporarily for a year past by Elbert M. Chandler, to whom a vote of thanks was tendered for his faithful and able services as acting secretary during a difficult period. Mr. Dunlap was born at Harrisville, N.H., on September 9th, 1882, is a graduate in Arts from Dartmouth College, and received the degree fo C.E. from Thayer School of Civil Engineering in 1908. On graduation Mr. Dunlap was appointed field instructor at the Thayer School and the next year he was advanced from instructor to associate professor of hydraulics and sanitary engineering and later professor of hydraulics and sanitary engineering, College of Applied Science, State University of Iowa, which position he occupied until his recent appointment. Since 1915, Mr. Dunlap, in addition to his professional work, has carried on a general practice as civil and sanitary engineer, acting for the Iowa State Board of Control and for the Iowa State Board of Health. Since 1913 Mr. Dunlap has been a prolific contributor to engineering literature, particularly in connection with sewage and water supply, but has also found time to take an active interest in engineering welfare as shown by his paper before the S.P.E.E. on "Co-operation between Engineering Societies and Educators in Standardizing Engineering Education". Besides being a member of the Amer. Soc. C.E. his membership includes S.P.E.E., New England Water Works Assn., Amer. Water Works Assn., Amer. Public Health Assn., Proportional Representation League, Thayer S. Engrs. and I. Eng. S., N.J. Mr. Dunlap is president of the Social Service League of Iowa City and a member of the executive committee, Boy Scout Council, Iowa City, and also a member of Gamma Alpha, Phi Beta Kappa, Sigma XI, the Triangle Club and the Progressive Republican.

American Electrochemical Society

Annual Fall Convention in Montreal

The annual Fall Convention of the American Electrochemical Society was held in Montreal, September 21st to 23rd, with headquarters at the Windsor Hotel. An invitation to participate in the various functions was extended to all members of *The Institute* in Montreal. Scientists of pre-eminence in the domain of electrochemistry of North America, to the number of two hundred, were in attendance, including among others the following:

Carl G. Schluederberg, assistant manager of the Westinghouse Company, Pittsburgh, who is the president of the society; Professor Wilder D. Bancroft, of Cornell University, Ithaca, N.Y., Robert Turnbill, manager of the U.S. Ferro Alloys, Niagara Falls, N.Y.; F. A. J. Fitzgerald, consulting engineer and electric furnace expert, of Niagara Falls, N.Y.; Acheson Smith, vice-president and general manager of the Acheson Graphic Co., Niagara Falls, N.Y.; J. V. N. Dorr, president of the Dorr Company, New York and London; H. M. Williams, chief metallurgist of General Motors, Dayton, Ohio; H. W. Matheson, vice-president Canadian Electro Products, Shawinigan Falls. J. A. Matthews, president of the Crucible Steel Co., New York; E. L. Crosby, president of the Detroit Electric Furnace Co.; Professor Lash Miller of Toronto University, considered one of the leading authorities of the present day on electro-chemical matters; Wirt S. Scott, manager of the industrial heating section of the Westinghouse Company, Pittsburgh; Prof. M. A. Hunter, of Rensselaer Polytechnical Institute, and director of research for the Driver-Harris Co.; Prof. Alexander Lowy, of the University of Pittsburgh.

The programme for the three days session, besides providing a number of enjoyable social features, included many papers of current interest.

Geodetic Society

The Geodetic Survey of Canada, of which Noel J. Ogilvie, M.E.I.C., is superintendent, has among its engineers a large number of members of *The Engineering Institute.* The work of the survey extends from coast to coast and no better idea of the extent of this work, nor of the fellowship existing among the members of the staff of the survey, can be obtained than through the pages of a small publication issued by the staff of the survey entitled, "News Letters of the Geodetic Survey of Canada". In a recent issue of this publication are a number of very interesting letters describing the work of various engineers in the field, among which are contributions from the following members of *The Institute:*—Hazen P. Moulton, A.M.E.I.C., who is this year on precise levelling in Nova Scotia, having commenced in the neighbourhood of Port Hawkesbury; D. McMillan, A.M.E.I.C., on precise levelling around the Bay of Fundy; Claude H. Brabazon, A.M.E.I.C., on triangulation in the neighbourhood of Magdalene Island; W. C. Murdie, A.M.E.I.C., in charge of triangulation work in the lower St. Lawrence; J. W. Menzies, A.M.E.I.C., on secondary triangulation work in the Saguenay district; H. G. Rose, S.E.I.C., on reconnaissance work in the neighbourhood of the Bay of Chaleur; George F. Dalton, A.M.E.I.C., in charge of precise levelling in the Northern Ontario district; D. J. Fraser, A.M.E.I.C., at Union Bay, B.C.; N. H. F. Smith, Jr.E.I.C., on precise level work, Sicamous, B.C.; G. H. McCallum, A.M.E.I.C., on triangulation work at Namu, B.C.

A Course of Industrial Metallography

Under the auspices of the Department of Metallurgy of McGill University an extension course in Metallography will be given as in previous years, by Messrs. Harold J. Roast, F.C.S., F.C.I.C., and Charles F. Pascoe, F.C.I.C.

The course consists of fifteen periods, held on Monday nights at the Chemistry and Mining building McGill University, commencing on Monday, November the sixth at 8.00 p.m.

Application should be made to either of the lecturers, their address being McGill University, Department of Metallurgy. The fee for the course is $20.00 payable to the Bursar. In as much as only twelve members can be accommodated at one time, students will be enrolled in order of their applications.

In past years the class has been composed of mechanics, engineers, chemists and those desiring a winter hobby, or whose business brings them in contact with metals and who desire to have more knowledge of their composition. *No previous knowledge is assumed* and the course is essentially practical from first to last. If any students from a previous year desire to continue their work provision will made for an advanced course if sufficient members are obtained.

Ferrous and non-ferrous metals are dealt with equally, training being given in preparing them for examination under the microscope, and finally photographing the various structures developed.

CORRESPONDENCE

Stewart & McDonnell,
Gold Coast Harbours
Seccondee, Gold Coast Colony.
August 19th, 1922.

Editor, *Journal:*—

Dear Sir:—

As I have not received any communications from *The Institute* for some considerable time I would like to draw your attention to the change in my address.

Associated with me here are Majors Crysdale and Silcox and at present we are all engaged on the preliminary work for the construction of a harbour at Takoradi, about six miles from Seccondee. The work is very interesting and novel and the methods of labour so far have been entirely new to us. To date the grading for temporary and service lines of railway have all been done by local labour. All the material has been moved by baskets and head work, and the grading has been remarkably well done, although it has required careful supervision.

By the time you receive this, steel will be at the site of the proposed harbour, and arrangements for the commencement of the protection works will be started.

At a later date I shall be very glad to give any further details of this Canadian enterprise should you desire it.

With kindest regards, I remain,

Yours truly,

A. G. GRAHAM, A.M.E.I.C

A. G. Graham, A.M.E.I.C. Major Augus Stewart, A.M.E.I.C. Col. McDonald S. C. Arnett Major C. R. Crysdale, M.E.I.C.

Canadians on Harbor Construction at Gold Coast Harbours, in Africa.

Preliminary Notice

of Applications for Admission and for Transfer

20th July, 1922

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in August, 1922.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option, Railway, Municipal, Hydraulic, Mechanical, Mining or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects. Geography, History (that of Canada in particular), Arithmetic, Geometry, Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits scientific acquirements ,or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

APPLETON—ALBERT THOMAS, of 711, Banning Street, Winnipeg, Man Born at Hamilton, Ont., Sept. 12th, 1883; 1905-09, operating, Dominion Power and Transmission Co.; 1909, chief electrician in chg. Port Colborne Cement Plant; 1910, asst. electrician in the installing of the electrical equip'mt., Oliver Chilled Plow Works, Hamilton, Ont.; 1911, install'n. of terminal station for Canadian Westinghouse Co., Winnipeg; Oct. 1911, chief operator in chg. of sub-stations and from 1912 to date, supt. of stations, City of Winnipeg Hydro Electric System.

HATTON—GERALD PERCY, of Calgary, Alta. Born at Cork, Ireland, Feb. 26th, 1871. Educ., B.A., and B.E., Royal Univ. of Ireland 1892 and 1893; 1894, post graduate course in civil engr'g., and asst. lecturer to Prof. Alex. Jack, M.A., C.E., 1890-91, constrn. of Youghal Waterworks under S. A. Kirby, M.A., C.E.; in chg. of constrn., of Cork and Passage Rly., Kanturk and Newmarket Rly., Schull and Shibreen Light Railway under Mr. R. T. Perry, C.E.; 1895-96, prelim. surveys and estimates for Queenstown waterworks; 1896, Youghal waterworks and 1897, extension of Cork and Passage Rly. to Crosshaven; 1898-99, constrn. Queenstown waterworks including constrn. of reservoir dam, 1911-13, chg. of 6 foot main trunk sewer in East Calgary till its completion under J. T. Child, C.E.; worked for firm of Jarie Bros., Boomer and Hughes on elevator constrn.; enlisted 137th batt. C.E.F., until 1916, served on western front with 49th batt. C.E.F., and discharged 1919; at present engr'g. clerk, levelling office of Topographical Surveys Branch, Dept. of the Interior, Calgary, Alta.

Principles and Practices for the Valuation of Public Utilities

Some Important Considerations entering into Various Methods of Valuating.

R. A. C. Henry, M.E.I.C.

Engineer in charge, Grand Trunk Arbitration, Department of Railways and Canals.

Paper read before the Ottawa Branch, The Engineering Institu te of Canada, March 30, 1922.

Valuation implies the ascertainment of the "value" or worth of a thing. Value is defined in the Standard dictionary as the "desirability or worth of a thing as compared with the desirability of something else"; it is a term, however, which has been used rather loosely and has been aptly described as one of the most uncertain words in the dictionary of economics.

The valuation or appraisal of public utilities is by no means a new idea, in fact it dates back to the inception of the public utility. The earliest railway laws of some European countries, notably Germany, Switzerland and France, contained provisions for the purchase of railways by the State upon various bases of valuation. In America the idea is also as old as the public utility. The industrial and economic development which has taken place during the last thirty years has brought about a relationship between the public and public utility corporations which has become very complex, and amongst the various questions entering into this relationship not the least important has been that involving the valuation or appraisal of these public utilities.

This question began to attract the attention of the engineering profession in North America to some considerable extent about 1900 and has since that date developed into quite an important branch of the profession.

Purpose

The valuation of public utilities may be undertaken for a number of purposes, among which might be mentioned the following:—

General public information. — A government or state may desire to obtain some information as to the relative value of various utilities for its general information, a good example being the valuation of railway properties in the United States for the Census Bureau in 1904 and 1905, which was done by Prof. Meyer of the University of Wisconsin. A description of this valuation will be found in Bulletin No. 21 issued by the Department of Commerce and Labour, Bureau of Census and entitled "Commercial Valuation of Railway Operating Property in the United States 1904." Another example of this is the valuation of the Canadian Northern and Grand Trunk Pacific Railways made by Prof. Swain for the Royal Commission appointed in 1916 to inquire into railways and transportation in Canada.

Taxation. — A governing body having the power to tax may desire to ascertain the relative value of utilities under its jurisdiction for the purpose of establishing a basis for taxation. An example of this may be found in the valuation of the railways in Michigan undertaken in 1900 by the Board of State Tax Commissioners, the actual valuation being under the direction of Professor Cooley, Dean of the Department of Engineering, assisted by Prof. Henry Earle Riggs who gave a lengthy description of the valuation in a paper before the American Society of Civil Engineers on January 4th, 1911. This paper appears in the "Transactions of the American Society of Civil Engineers" as Paper No. 1190.

Limiting capitalization. — A public service commission may desire to exercise control over the capitalization of a public utility for the purpose of protecting the public against loss of investment due to the over capitalization of the utility, and in order to do so, must ascertain the value of the utility. Examples of this may be found in the valuations made under the Stock and Bond Law of Texas passed in 1893 and also in the valuations now under way by the Interstate Commerce Commission.

Rate making. — Probably the best example of this is the valuation of the railways of the United States undertaken by the Interstate Commerce Commission under the provisions of Section 19A of the Interstate Commerce Act 1914. This valuation has not yet been completed.

Several of the state commissions have also had valuations made for purposes of taxation or rate making.

Expropriation. — Good examples of this are the expropriation by the Dominion Government of the Carslake hotel property at Montreal and the Halifax dry dock at Halifax. A noted case in the United States is the expropriation of the Maine Water Company known as the Kennebec Water District case.

Sale or purchase. — Many railways in Canada and the United States have been purchased and sold on some basis of valuation.

Underwriting securities. — It is not an uncommon practice for bankers to make valuation of public utility properties in connection with the underwriting of securities.

Sharing facilities. — Public service corporations very frequently enter into joint facility contracts which usually necessitate the valuation of the facilities to be used jointly.

Reorganization. — Valuations are often undertaken in cases of the reorganization of public service corporations which have got into difficulties from one cause or another or for the purpose of arriving at a basis of establishing the relative value of the securities of two utilities which it is intended to consolidate under a consolidation or reorganization scheme.

Practices and Principles

Many persons are of the opinion that the value of a public utility established by appraisal should be the same regardless of the purpose for which the appraisal is actually undertaken, in fact, it has been suggested that it would probably be better if the person making the appraisal were ignorant of purpose for which it was to be made. However this may be, the practices and principles governing the valuation or appraisal of public utilities have varied very widely in the past and undoubtedly have been influenced to a very great extent by the purpose for which the valuation was undertaken, by the time available, by agreements which may have been made between the interested parties laying down the principles to govern in particular cases, and by the judgments given in previous cases of a similar character by the courts.

In any given case the questions at once arise as to how the value is to be ascertained, as to what the test of value is to be and as to what factors should be taken into account in establishing value. In general, it may be said that all elements affecting value should be given due consideration and proper weight. Some of the principal bases used in ascertaining or testing value are described below.

Capitalization of Net Earnings

The early railway laws of Prussia made provision for the purchase of any railway and all its property at a fair value, such value to be determined upon the basis of the net earnings for a period preceding the date of acquisition. The actual purchase of Prussian railways by the state, however, was not done on this basis, but upon the basis of facts presented with respect to the results of operation for a period of years, the condition and earning capacity at the time of purchase and the potentialities of the property.

Professor Meyer in the commercial valuation of railways in the United States for the Bureau of Census applied this method, as the time at his disposal was brief and his valuation was intended to give a rough idea of the commercial value of the railways. His method was to capitalize the average net earnings for a period of five years; in cases of recently constructed roads, the cost of construction and equipment was used; in the case of roads whose sources of traffic would be exhausted within a determinable period, the scrap value was taken as the base, to which was added an allowance corresponding to the probable length of time during which revenues could be earned; in the case of roads having no earnings, or prospect of earnings, the scrap value was taken.

A valuation made on the basis of the capitalization of net earnings over a period of years, usually involves a detailed study of the accounts of the public utility during the period under review to ascertain the practices which have been adopted; and very often it is necessary for various reasons to recast the accounts entirely before a true picture of the net earnings for the period chosen can be presented.

An analysis of the accounts may show that no provision has been made for depreciation; that operating expenses have been charged to capital account; that additions and betterments have been charged to operating expenses; that bad debts have not been written off; that credit has been taken for interest on advances and loans when no interest has been collected or is collectible; or that improper material stock adjustments have been made.

It is also necessary to examine the physical property to see if it has been properly maintained and developed, as these factors have a bearing on the net earnings. If the valuation is being made by a prospective purchaser as a commercial proposition, that purchaser is primarily interested in what return he can reasonably expect on his money, consequently the net earnings, present and prospective, are the principal measure of the value of the property to him. If, on the other hand, the valuation is to ascertain what shall be a fair rate to allow for service, it can be readily seen that the capitalization of net earnings would simply involve reasoning in a circle.

Analysis of Market Quotations of Stocks and Bonds

A very common method of valuing the property of public utility corporations by bankers, financiers and commercial interests for purposes of the purchase of securities, the underwriting of securities or the purchase of the physical properties of corporations, is by what is known as the stock and bond method, which consists in reviewing the market quotations of the stocks and bonds of the utility for a period of years and basing judgment as to value on these market quotations. This method is considered in some quarters as a very accurate one, as the prices established on the exchange are supposed to represent the resultant of a combination of the judgments of a very large number of individuals.

An analysis of market quotations of stocks and bonds would necessarily have to be supplemented by an examination of the rights, franchises, physical condition of the property and the accounting methods adopted by

the utility in showing the results of operations, otherwise any judgment as to value, established solely by an analysis of stock and bond quotations, might be very far from the actual value.

A great many public utilities, however, would not be susceptible to a valuation on this basis, as the securities may not be quoted on the stock exchange at all, or if quoted on the exchange, are held by a limited number of persons, so that actual transactions are so few in number as to render it very difficult to base, on such sales, any judgment as to value.

Analysis of Original Cost to Date

This means that an analysis must be made to ascertain the original cost of the items of physical property of the public utility at time of construction, to which must be added additions and betterments properly chargeable to capital account, made from date of construction to date of review, and from which must be deducted all items retired or disposed of. It is also necessary to ascertain the actual cost of other items not of a physical character entering into the development of a public utility, amongst which might be mentioned the following: Promotion expenses; expenses of preliminary investigations, securing charter rights, franchises, and financing; organization expenses; overhead expenses during construction, including legal expenses, expenses of engineering and supervision, taxes and insurance, interest during construction, other general administration expenses; development expenses in building up the business from a 'bare bones' state to a 'going concern'.

The analysis of the actual cost of the various items mentioned above usually involves: The preparation of a detailed inventory, properly classified, of all items making up the physical property as of the date of valuation; a thorough analysis of the records and accounts of the utility to ascertain the actual cost of the physical items included in the inventory, as well as of all other items which may properly be included as part of the cost.

The work necessary and the extent to which the actual cost can be ascertained depends entirely upon the nature of the records and accounts which are available. The records and accounts may be such that the original cost to date can be ascertained quite readily; they may be such that the original cost can be ascertained, but not without a partial or entire recasting of the operating accounts from the date of operation; and they may be such that the original cost cannot be ascertained at all.

After the original cost to date has been ascertained it becomes a question of finding the relation between cost and value. This involves consideration of the physical condition of the property, operating results over a period, franchise or other rights, other intangible elements of value, and potentialities of property.

Estimating Cost of Reproduction New and Cost of Reproduction New less Depreciation

Estimating the cost of reproduction new is a practice which has been resorted to, partly because of the impossibility in a great many cases of obtaining records which disclosed the actual cost and, partly for the purpose of taking account of any increment in value subsequent to date of construction caused by the development of the tributary territory or for any other reason.

The Committee of the American Society of Civil Engineers in its "Report to Formulate Principles and Methods for the Valuation of Railroad Property and other Public Utilities," (1917), defines cost of reproduction as follows: "The estimated cost of reproducing the property without deduction for loss of value due to age or other causes."

This method involves the conception of the reproduction of the property as at the date of the valuation. Practice, however, has not been uniform; some valuators have considered all physical conditions as of the date of valuation; others considered historic physical conditions as far as the units of property embraced in the utility are concerned, but all other conditions as of date of valuation; others have considered original conditions throughout; others have considered substitute units in conformity with present day practice, the idea being to ascertain the cost of constructing a utility to perform the same service as the one under consideration.

Some questions arising in connection with the reproduction theory, which are more or less perplexing, might be mentioned. The property of a water company in a city is being appraised for the purpose of establishing a fair rate to be charged the public for water. The water mains were all laid by the company before any paving of the streets was done. At date of valuation, streets have all been paved at public expense. In order to reproduce the water system, it would be necessary to remove and replace the paving. The question to be decided is, should the cost of removing and replacing the paving be considered as an element of cost of reproduction, when the purpose of the valuation is to establish a fair rate to be paid by the public for the water service?

The Grand Central or Pennsylvania Terminals in New York are to be appraised on the reproduction theory. Should this be done on the assumption that the sites of these terminals were covered with buildings which had to be wrecked, as was actually the case, or on the assumption that no buildings existed on the sites at all?

A certain railway is to be appraised by a public service commission for the purpose of arriving at a fair value for rate making. No records of cost are available, but it is known that the company received, from the public paying the rate, a grant of what is now very valuable property. The question arises as to how this is to be treated in a reproduction estimate of cost when the purpose is a fair value for rate making purposes. Is the value upon which the rate is to be based to include the cost of acquisition of the granted land at date of valuation?

A railway was originally constructed through a thickly wooded country and of necessity the clearing and grubbing of the right-of-way was an item of considerable expense, although the actual cost of the land was only ten dollars an acre. Fifty years later the adjacent country has been entirely cleared, is under cultivation and ranges in value from one hundred to two hundred dollars per acre. This property is to be appraised

on the reproduction basis. Is it to be assumed that the cost of the land is from one hundred to two hundred dollars per acre and also that clearing and grubbing has to be done?

Special Considerations in Reproduction Cost

The following extracts from the report of the Special Committee of the American Society of Civil Engineers may be of interest:

"*Wachusett reservoir.* — This reservoir was built to supply water to the Metropolitan District of Massachusetts. To construct it, it was necessary to acquire land on which there were many buildings, and mills with their water powers. Included in the reservoir site there were also many highways and two railroads. As a substitute for the highways obliterated, others had to be built around the margin of the reservoir, and some were raised above the water level. One of the railroads was relocated for many miles at one side of the reservoir, and another was raised. To make the reservoir a better receptacle for water, the surface soil was stripped from its whole area. One main dam and two subsidiary dams were necessary for holding the water. Incidentally, under special laws, damages had to be paid for real estate which was not acquired, but which was said to be damaged indirectly by the construction of the reservoir."

"*Kensico dam.* — This dam, of the New York waterworks, was necessarily located within the limits of an existing reservoir, the water of which could not be drawn down until two new temporary reservoirs had been created farther up stream to maintain the water supply. After these had been completed, the old Kensico reservoir was drained and the old dam removed. After the completion of the new Kensico reservoir, the two temporary dams and reservoirs will be useless.

"*The AuSable dams.* — By building three dams on the AuSable river in Michigan, the Commonwealth Power Company flooded hundreds of acres to a depth of forty feet. There was not a house, not a mile of road, no railroads, no damage to property of any kind such as was encountered in the other reservoirs. It was only necessary to acquire the needed lands and flowage and build the dams, without property damages in any appreciable amount.

There are now no buildings, roads, or railroads in the basins of any of these reservoirs, nor does the connection of the Kensico auxiliary reservoirs with the construction of the main dam appear. Therefore, in these three cases, presently existing conditions are not indicative of work done or difficulties encountered in actual construction in the past, nor of what it is fair to assume would be the conditions to be found had the reservoirs not been built. Conditions may be now essentially similar, immediately about these reservoir sites, but it would seem to be unfair for this reason to assume like conditions to govern the estimate of reproduction cost to be used as a basis of "fair value".

"(1) *Shall present or original physical conditions govern?* — The conclusion of the committee is that, while apparent present day conditions that would affect the cost of reproducing the property must be considered in any logical estimate, yet history must also be considered to determine what is to be reproduced, the conditions under which it is to be reproduced, and how the estimates must be made; that for all those items, concerning which there can be no doubt, the engineer should use the basis plainly applying, and that for those that are doubtful, or have been questioned, he should present the effect of the use of the different bases clearly, that the determining body may have the data for a wise decision.

"(2) *Shall original or present prices govern?* — For reproduction cost the committee recommends that, in estimating, the prices prevailing at the assumed time of reproduction shall be used, meaning the normal price obtained by averaging prices for a proper period, as is discussed subsequently in this chapter under the caption, 'Unit Price's.

"(3) *Shall identical or substitute plant be considered?*— In line with the foregoing discussion, the committee recommends that reproduction estimates be based on the assumption that the identical property is to be reproduced rather than a substitute property; that while apparent present day conditions that would affect the cost of reproducing the property, must be considered in any logical estimate, yet history must also be considered, to determine what is to be reproduced, the conditions under which it is to be reproduced, and how the estimates must be made; that for all those items concerning which there is no doubt, the engineer should use the basis plainly applying, and that for those that are doubtful or have been questioned he should present the effect of the use of different bases clearly, that the determining body may have data for a wise decision; and that normal present conditions shall determine the prices and methods for doing the work."

Hypothetical Development Stages to be Considered

The reproduction idea involves the laying out of a hypothetical development programme taking into consideration, the promotion, organization and financing stage; the construction stage; and the development stage. To the several elements entering into each of the above stages must be assigned an estimated cost.

Promotion Organization and Financing stage.— The promotion of a utility corporation requires initiative, some preliminary investigation, and steps necessary to interest financiers and others in the project. The cost is usually estimated as a percentage of the cost of the whole project. The next step after the promotion is the incorporation and organization of a company, the obtaining of charter and franchise and other features of like nature. The cost of this is usually estimated as a percentage of the whole cost. The next step is to arrange for financing the project, usually by the issuance of securities to be paid to a trustee and advanced by the trustee to the company as the construction of the utility progresses. These securities are usually underwritten by bond houses at a discount, in addition to which commissions must be paid and other incidental expenses incurred. Commissions and incidental expenses in connection with financing are considered as proper costs and are usually estimated as a percentage of the amount of the securities issued. Discount, however, is not usually considered as a proper element of cost in a reproduction estimate, as

it is actually an adjustment of the interest rate and should be amortized over the life of the securities.

Construction stage.— (a) Period of construction:— A reproduction estimate would not be consistent if it assumed the creation of a public utility by a single impulse. A reasonable construction period must be assumed, the duration of which depends to a large extent upon the nature of the property to be reproduced; this might vary from a few months to two or three years.

(b) Inventory:— It is usually necessary to make an inventory of all the items of property involved in a utility and to classify them properly according to a recognized classification. Such inventory should also include a description of each item with remarks as to any special feature which would affect an estimate as to cost of reproduction.

(c) Unit costs of construction:— When the units of property are all inventoried and classified, the next step is to apply unit costs to the various items. These unit costs may be based upon the average for a period just prior to the date of valuation, or, for some representative period prescribed by agreement between the parties interested.

(d) Cost of acquisition of land:— Some of the most difficult questions in connection with valuation on the basis of reproduction arise in connection with land. After an inventory has been made showing the areas of land belonging to the public utility, properly classified in accordance with the locality and nature of the development in the adjacent territory, the question arises as to how the cost of acquisition of the land under the conditions obtaining at the date of the reproduction estimate is to be estimated. Usually a canvas is made to ascertain from actual records of sales and other general local conditions the value of adjacent property at the time of the valuation, or, for a period prior thereto, and the value of adjacent property ascertained in this manner is used as a basic cost in the reproduction estimate. To this basic cost is usually applied a certain factor varying according to circumstances, sometimes called a multiple. By this means effect is given to the fact that a railway or other public utility has to pay for property in excess of the value of adjacent property, because certain strips or areas are required in particular locations and of probably irregular shapes which results in the utility corporation usually having to pay higher rates than would be paid for the adjacent land for ordinary purposes and, in addition, the taking of land usually involves claims for severance or damages. These factors or multiples are usually estimated by reviewing the experience of some other utility for which records of cost are available and applying the multiples or factors so ascertained to the particular case under review. The excess cost may vary from 25 per cent or 50 per cent of the cost of the adjacent land to double the cost.

(e) Engineering and supervision: — During the construction stage it is necessary to carry on preliminary engineering investigations, draw up plans and specifications and to generally supervise the work. The cost of this work is usually estimated at a percentage of the cost of the items involved.

(f) Legal expenses:— This includes any legal expenses which may be necessary, including the costs of litigation, and is usually estimated on a percentage basis, consideration being given to any conditions which may be peculiar to the particular utility under review.

(g) Taxes and insurance during construction:— It is quite possible that arrangements would have to be made for the payment of taxes and for certain insurance during the construction period. This would depend to a large extent upon circumstances and is usually provided for by adding a percentage to the other costs.

(h) Interest during construction:— As it is necessary to provide money during the period of construction for which interest has to be paid in one form or another, and as there is no source of revenue out of which such interest can be paid until the utility has been completed and in operation, it is considered proper to include in the cost an allowance for a reasonable amount of interest during construction, such interest being computed upon the basis of the amounts assumed to be expended from time to time during the construction period.

(i) Contingencies:— In an estimate made as to the cost of any work, it is customary to add thereto an allowance to cover all uncertainties in the quantities and prices or for unforeseen conditions, as in actual practice it has been found that even under the most careful investigation as to quantities and prices, conditions which could not have been foreseen develop and add to the cost This item of contingencies is usually estimated on a percentage basis.

(j) General administration:— In addition to the foregoing, there are usually certain general administration expenses which have to be provided for during the construction period and which may be estimated as a percentage of the other costs.

The development stage.—At the date of the completion of the public utility there exists a plant ready to do business in what might be called a "bare bones", inert condition, ready to function but not actually functioning. It requires to be built up and developed. This can only be done by the energy, perseverance and solicitation of the officers in charge and usually takes some considerable time and involves some considerable expense. It might be designated as the expense necessary to bring the plant from an inert state to a 'going concern' state.

It is considered by some writers that the amount which should be added to cover development cost should represent the deficiency between the actual return and the fair return on the investment in the first few years of operation. In fact, it is considered that this development cost is substantially the same as interest during construction and consequently chargeable to capital.

Cost of Reproduction Less Depreciation

The only consideration necessary with respect to this phase of valuation is in connection with the term "depreciation", and no discussion on the subject of practices of valuation would be complete without a reference to it.

Depreciation is essentially an expedient adopted to anticipate and provide for a condition which it is expected may have to be met at some future time. It is, however,

a subject which has been very much discussed. It is defined in the dictionary as, "a belittling or running down of value or merit; a fall in value; reduction in worth; the act of lessening or bringing down price or value."

The committee of the American Society of Civil Engineers in its report says, — "Perhaps there is no single subject in connection with valuation that has caused more trouble than depreciation. This has been due to various causes, perhaps not the least of which has been confusion in the use of the term. Depreciation is sometimes used to mean decretion, which is loss of service life, sometimes to mean the money allowance made in bookkeeping to offset accruing loss of service life, and sometimes the loss of value existing at any time due to loss of service life or any other cause. The committee will use it only as meaning the loss of value or worth of property units which are parts of 'going concerns'."

A writer says that the engineer's conception of depreciation is an amount to be determined and deducted from original cost, or cost of reproduction, in valuation practice in order to reach present physical value. It has been defined as the loss of value due to age and use, including the loss from deterioration, wear and tear, inadequacy, obsolescence, depletion and other similar causes. It has also been defined as the lessening in worth of physical property due to use, approaching end of useful life, or other causes. It cannot be made good by repairs, but only by replacements. It must be clearly distinguished from loss of efficiency which does not begin until depreciation is almost complete. Some writers prefer to use the term "decretion" when referring to loss of service life or lowering of physical condition or the gradual approach of the time when the physical unit can no longer function because of age, decay, accident, inadequacy, obsolescence or other causes. The committee of the American Society of Civil Engineers in its report uses the expression "decretion" in the sense just mentioned. This committee, as well as some writers, refers to depreciation only in the sense of the loss of value or worth. Decretion in this sense is that loss of service life which cannot be made good by repairs. Depreciation in this sense would include the loss of value due to decretion as well as that due to of lack of repairs. It is a stern cold fact, however, that in the case of every public utility at some time in the future, certain or all of its units will from one cause or another, cease to function. Call this feature what you may, failure to appreciate it and provide for the same is often very disastrous.

There is a considerable difference of opinion amongst engineers and others as to whether or not, in a reproduction estimate, anything should be deducted for depreciation. The argument advanced by the exponents of the theory that no depreciation should be deducted, point out that if a utility is properly maintained and in such a condition that it requires no expenditure of money to improve its physical condition, no depreciation ought to be deducted, because the machine is functioning just as well as if it were new and, insofar as the rendering of service is concerned, it renders that service just as well as if it were new. In case of the purchase of a public utility, it does not seem reasonable that a prospective purchaser in arriving at the value could fail to take account of the fact that although in perfect operating condition, there are physical elements in an old property which are nearer to the date when they will cease to function than they were when new and to make corresponding deductions from any estimate of reproduction new.

In case of the ascertainment of value for rate making, let it be assumed that a reproduction estimate has been made and the amount by which the existing elements fall below their condition new ascertained. Should a deduction be made from the estimate of reproduction for rate making? Essentially the object in view in the establishment of a rate to be charged by a public utility for service to be rendered is, that the rate shall be fair and reasonable to all concerned, that is to say, it shall be such that all operating expenses are met and a reasonable return made upon the reasonable value of the property used in the service. If in the course of time, the physical property of the utility has reached a condition somewhat below its condition when new, but which might be called normal operating condition, and will require in the future only normal expenditures to maintain that condition, but during the period taken to reach its present condition from new the owners have received rates sufficient to pay operating expenses, including accruing depreciation, and a fair return on the fair value of their property, and have chosen to take out in dividends the amount representing the accruing depreciation, then obviously something should be deducted from an estimate of reproduction on account of accrued depreciation which, in this case, represents capital actually returned to the owners. If, on the other hand, the rates in the past have been subject to regulation and have not been sufficient to cause this return of capital to the owners, then no depreciation should be deducted.

Going Concern Value

'Going concern' value, as distinct from development cost, is a value which is placed upon a utility in addition to its 'bare bones' cost, because of the fact that the plant is functioning, it may be more or less in terms of money than the development cost.

Mr. Leonard Metcalf in a paper read before the American Society of Civil Engineers in 1909 says:

"It may be defined as the cost of establishing, up to the level of the net income of the old plant at the date of taking, the business of a similar new plant, (but not of a more perfect system which the city might build), which is supposed to begin operation upon the date of the taking, the old plant going out of business at the same moment. Or, to put the same thing in another way, it is the measure of the greater value, (at the date of taking), of an old, established plant, over a similar new plant completed and ready for operation upon the date of taking. Or, to put the same thing in still another way, it is the measure of the cost of developing the business of a new plant to a point coincident with the net income, upon the date of taking, of the old plant."

An engineer named Alvord advanced a theory in 1902 for ascertaining 'going concern value', which is described as follows:

"It is assumed that a new plant will be constructed, the inception of which is coincident with the date of arbitration. Such new plant is to be of an equal capacity with the older plant under consideration, and a due allowance of time in which to construct this new plant, and the necessary capital to be invested in it from time to time is estimated. At the completion of this new imaginary plant, it is assumed that it commences to obtain business in that community from those who are not previously accustomed to the free use of public water, except in a general way and that it is to require the business ability and consequent

increase in number of customers which the earlier and older plant went through within the early years of its existence. An assumption of the amount of business thus created for each year for a period of years in advance is carefully computed and estimated by the board of arbitration. The losses of interest upon capital invested are duly fixed, as well as the first absence and later addition or revenue from hydrant rentals, and a table is prepared showing each year, the total business developed and the total losses, if any. After this is completed a forecast is made of the business of the older works for the same period of time in the future that it takes the business of the new works to equal the business of the old works. If the business of the old works is found to be a growing one it will be a longer period that the new works will require to overtake it than will be the case if the business of the older works is stationary or decreasing. In general, the differences which might be called the debits and credits of this new imaginary plant and the debits and credits of the older working plant are reduced to their present worth at the time of appraisement, and an estimate is made which will adequately represent the financial advantage which the old works, (already fully equipped and in running order and having a large number of profitable customers), will have over the new works, where everything must be built and customers secured.

"It is necessary in making this supposititious estimate of the new plant to consider it in no way a competitor of the older works; there is not supposed to be competition between the new and the old, but it is left to the experience of the board of arbitration to consider how long it would take the new company to build new works, and build up business for the new works, until they have overtaken the business of the old company should it continue to occupy the same territory."

Agency and Competitive Theories

A noted authority in the field of valuation, Halbert G. Gillette, states that the differences in opinions held by appraisers with respect to important points arising in connection with the valuation of public utilities for rate making arise from a difference in conception as to the relation of the public utility to the public.

Broadly speaking there are two conceptions or theories which, unconsciously perhaps, influence the minds of appraisers. They are radically different. These theories have been called, the "agency theory," and the "competitive theory."

According to the agency theory the public utility corporation is an agent of the public, authorized and bound to render to the public certain service for which it is entitled to receive from the public a sum sufficient to meet all operating expenses and, in addition, a fair return upon the capital invested. According to the agency theory, therefore, the value for rate making purposes is the reasonable actual investment in the property. According to the competitive theory the public utility corporation is authorized to render the public certain services and is entitled to receive from the public whatever the traffic will bear under competitive conditions. According to this theory the value of the property would be the cost of reproduction less the capitalized difference in annual cost of production of service or operation by the existing plant as compared with the most modern plant.

Recent Valuation Cases

Among the more recent valuation cases are the following: Valuation of the Canadian Northern Railway and Grand Trunk Pacific Railway by the Royal Commission appointed by the Dominion Government; the Winnipeg Electric Railway by the Public Service Commission of Winnipeg; Ottawa Street Railway by the City of Ottawa; the United States Interstate Commerce Commission valuation of railroads; valuation by the State Board of Assessment for Wisconsin of the railroads properties; the valuation of the properties of corporations in Michigan, made by the board of Tax Commission. There have also been a large number of joint facility valuations by railways in Canada for the purpose of arriving at a rental for the use of facilities, notably at Quebec, Montreal, Ottawa, Toronto, the Toronto to Hamilton joint section, the Windsor to Bridgeburg joint section, Winnipeg and at other points.

Some Fuel Problems of the Steel Plant

A review of the Requirements and the Distribution of all Available Fuels.

E. E. Litz, M.E.I.C.

Chief of Department of Fuel and Efficiency Engineering, Algoma Steel Corporation, Ltd.

Paper read before the Sault Ste Marie Branch, The Engineering Institute of Canada, April 1922.

This paper is intended to show the possibilities which present themselves for a more complete utilization of the coal and by-product fuels in the manufacture of steel products from raw materials. Not so much from the standpoint of efficiency in the furnaces and appliances of various kinds, but in the arrangement of a general programme covering the entire fuel problem from the mine to the last smoke stack. While there is a wide field for increased efficiency in the use of fuels in every branch of the industry it in no way compares to the possibilities which exist in almost every steel plant for the elimination of the loss of fuel on account of the lack of co-ordination of the problems of the various departments under one efficient head. The surplus fuel of one department can often be made available for another department and a large credit obtained where previously none was received.

Frequently peak load demands on fuel and power are produced by several departments at the same interval of time which can be scheduled into a uniform load over the entire period, and thereby eliminate numerous delays, increase production and reduce costs. An example to

illustrate this point occurred at a plant where the writer was employed. The delays were very numerous on account of steam, with a generating capacity of 6,000 boiler horse power while the same plant afterwards was operated to a greater capacity with 3,500 boiler horse power, with no delays for steam and a number of boilers were permanently disconnected from the steam mains, thereby saving thousands of dollars per month.

In the various departments where coke oven gas is available it is necessary to determine at which plant the gas can be used to the greatest advantage and at which plants it will be necessary to use producers or other fuel, as almost every department head will insist that it will be utterly impossible to operate his plant with any other fuel but coke oven gas owing to numerous reasons. Also there are various uses where efficiency of one fuel over that of another are at wide variance and a proper selection means large financial gains. There is also a great difference in the value of coals for all metallurgical purposes dependent upon the uses for which they are employed, and the selection of the coals should have the greatest inspection possible both at the mines and at the receiving station. It is worthy of notice that all finished products of the steel company are scrutinized with almost microscopic closeness and both physical and chemical tests are made of every heat, yet it is a rare occasion when the most important material that goes into the production of steel receives more than the superficial inspection of more or less incompetent help.

The coal used by the Algoma Steel Corporation is produced at the mines owned and operated by the parent company. They are the Algoma mine in McDowell county, West Virginia, from which is produced a semi-bituminous coal known by the trade name of Pocohontas coal, and the Cannelton mine, which is also in West Virginia, and from which a bituminous high volatile coal is produced. The proportions in which the two coals are received depends largely on their market value and has been, at the coke plant, in proportions varying from 20 per cent of the former to 80 per cent of the latter, to a 50-50 mix.

Owing to the necessity of accumulating the entire year's supply of coal during the time the lakes are open for navigation, the company is confronted with the problem of properly storing the coal to secure the least heating and weathering effects. As it is frequently necessary to store over 500,000 tons of coal, the piles are deeper than desirable with the consequential over-heating and spontaneous combustion. Cross cutting and rehandling of the parts effected must be resorted to and large quantities of the fuel thus effected are rendered useless for coking and gas-making purposes. The coal thus transferred is therefore utilized for some other purpose at a considerable loss to the company.

The weathering of the coal in the pile is very noticeable as the winter progresses, as it produces less gas, and gas of a lower value than does the new coal. This result is immediately reflected in the practice of the furnaces showing a considerable loss as compared with the results when new coal is used. The fine or slack coal when received directly from the mines can be used in the producers with little complaint from the gas makers, but after weathering for a few months it is impossible to maintain either the quantity or quality of the gas sufficiently for open hearth requirements, which necessitates securing a large percentage of lump coal by means of screening the pile. The slack screened out is sent to the coke plant where it is also objectionable, as a poor grade of coke is produced and the by-products are also detrimentally effected thus reducing plant income to a considerable extent. The lump coal is weathered an appreciable amount, but not as badly as is the slack. This is due to the fact that only the surface of the lump comes in contact with the air. Weathering is a common term used to indicate that the coal has absorbed a quantity of oxygen and consequently the ratio between the oxygen and hydrogen has been reduced. If the oxidation proceeds faster than the heat is dissipated the temperature of the pile rises until ignition is the result. C. H. Porter of the Bureau of Mines gives a number of rules which, if followed, will prevent spontaneous combustion in the pile. Among them are the following:

1. Store only screened coal larger than one inch.
2. Avoid accumulation of old coal underneath new lots.
3. Store in piles having no interior point more than eight feet from an air cooled surface.
4. Rehandle coal reaching a temperature of 120 degrees F.

The coal for use in gas producers should have special selection and be properly sized. The fines, under an inch in size, should be screened out, together with all the lumps that will not pass over a two-inch screen. Special care should be taken to secure a gas coal with a low sulphur content and also a high fusion ash. The Cannelton coal answers to these requirements, except as to size and this feature is now a problem of live interest.

In order to get the values of the various fuels in such a form that one kind can be compared with the other, it has been the custom of engineers and chemists to compare them on the calorific basis. As the calory is a quantity seldom used in every day life and consequently hard to visualize, the unit of measure adopted herein is a pound of coal. The pound of coal is assumed to have the calorific value of 13,200 B.t.u., which was the average heating value of the coal received last season. In referring to a gas with an equivalent value of a pound of coal, it is meant that the amount of gas will have the same heating value as one pound of 13,200 B.t.u. All of the fuels in use are calculated on a coal equivalent basis. In some cases it would be impossible to substitute coal for the gas used and secure the same quantity of coal per ton of product, as a higher efficiency is obtained with the use of one fuel than with the other. However, as all the practices are commonly calculated on the pounds of coal required per ton of product, it will be far easier to compare than if the calorific value is used.

As was just stated, it is often possible to secure a higher efficiency in the use of one fuel than with another. This is particularly true in the case of using coke oven gas and tar. The coke plant might, therefore, be considered a plant for the transformation of coal into more desirable forms of fuel. The main object of course is to produce blast furnace coke, and all other products derived are incidental to the operation, but none the less important. For the purpose of this paper we are interested only in the by-products which are considered metallurgical fuels,

consisting of coke, gas and tar, but ammonium sulphate, which amounts to about twenty pounds per ton of coal, coked, is an item of importance. One hundred pounds of dry coal charged in the ovens will produce: 66.8 pounds of blast furnace coke, 5.25 pounds of breeze, 4.75 pounds of domestic coke, 3.45 pounds of tar, and 19.75 pounds of volatile matter of which 0.22 pounds will combine with sulphuric acid to form ammonium sulphate. The remainder represents 510 cubic feet of gas, or a ton of coal will produce 10,200 cubic feet. Of this amount 45 per cent is used by the ovens to maintain coking temperatures and the balance is available for other uses. Owing to the value of this gas for other purposes, a cheaper fuel may be used for heating the ovens at a distinct advantage, under some circumstances.

The coal equivalent values of the by-products from the coke ovens, per ton of coal are: 6.3 Imperial gallons of tar, 86 pounds; 200 pounds of breeze and domestic coke, 176 pounds; 5,610 cubic feet of gas, 212 pounds, or a total of 474 pounds of equivalent coal, and gas used to heat ovens, 173 pounds of equivalent coal.

The blast furnace must also be considered a source of fuel as it is a producer of a valuable fuel gas, depending in quantity and quality on numerous variables beyond the scope of this paper to analyze, but subject mainly to the character of the charge and specifications of the product.

Where iron ores are obtained from the Lake Superior mines and basic iron is being produced, the practice will average about 2,000 pounds of coke per ton of iron. From Brasserts formula, there will be 142,800 cubic feet of gas per ton of pig iron with a heating value of 94.5 B.t.u., per cubic foot. This gas has a coal equivalent of 1,022 pounds of coal. Of this amount, 40 per cent will be used for the hot blast stoves, and 15 per cent for the gas blowing engines, leaving a surplus of 460 pounds in equivalent coal. As only two-thirds of a ton of coke is produced by a ton of coal, the surplus of gas on this basis will be only 307 pounds. With the surplus fuel from the coke plant, we now have available 781 pounds of coal for other purposes, from every ton of coal charged at the ovens, and the coke produced used in the blast furnaces.

The requirements to produce a ton of finished rails, are as follows: Assuming the practice from ingot to car to be 80 per cent, ingot to blooms 86 per cent and open hearth practice 93 per cent, we will require to produce one ton of finished rails, 1.16 ton of blooms, 1.25 ton of ingots and 1.34 ton of steel from the open hearth. Coal required to heat 1.16 tons of blooms at 90 pounds per ton, 104.5 pounds; 1.25 tons of ingots at 130 pounds per ton, 162.5 pounds; 1.25 tons of ingots at 500 pounds per ton 625.0 pounds; or a total of 892 pounds of coal is required to produce a ton of rails from the open hearth.

The charge in the open hearth contains normally 50 per cent hot metal from the blast furnace. To maintain this ratio the amount of pig iron required to produce a ton of rails will be 50 per cent of 1.34 ton, or 0.67 ton. To produce 0.67 ton of iron requires 0.67 times 2,000 pounds of coke, or 1,340 pounds. The coal required to produce 1,340 pounds of blast furnace coke is 2,000 pounds.

Coal Required	Pounds of Coal per ton of rails
To produce blast furnace coke	2000
As shown previously was	892
Steam power, 59 h.p. at 4 lbs., per h.p.	200
Electric power and lighting 109 k.w. hr at 5.4 lbs.	540
Steam for heating, 20 h.p. at 4 lbs., per h.p.	80
Transportation and steam cranes	70
	Pounds of Coal
Total coal required per ton of rails	3782
Surplus fuel available from by-products	781
Net amount of fuel required to produce a ton	3001
If 100 k.w. hrs., electric power purchased	540
The fuel requirement will be	2461
40 boilers h.p., will be available per ton of rails if waste heat boilers are installed in the open hearth, giving credit to fuel account of	160
	2301

The problem of using the by-products from the coke plant and the blast furnaces in order to secure the efficiency which is now being obtained with the use of other fuels must be solved in order to operate at maxinum efficiency. The character of these fuels themselves adapt them naturally to different uses. The coke oven gas and tar which are of high calorific value and produce high flame temperatures of combustion can be used for open hearth fuels, and the blast furnace gas for soaking pits and reheating furnaces, or a mixture of both gases may be used for either purpose.

The open hearth furnace has adapted to the use of so many different kinds of fuels and fuel combinations that little need be said regarding the use of tar and coke oven gas, except as to the proportions in which they are derived from the coke plant. This proportion is 6.3 Imperial gallons of tar to 10,200 cubic feet of gas, when the assumption is made that all of the gas produced by the coke plant is available for use. This gives a total heating coal equivalent of 474 pounds of coal. As this is lower than the average open hearth fuel requirements, it will be necessary to redesign many of the furnaces, but as this practice has frequently been bettered in many plants it is no mere speculation. In fact one plant claims to have a fuel practice on the use of coke oven gas alone, of 360 pounds of equivalent coal. The practice in one of the large steel plants using combined tar and gas varied from 16 to 20 gallons of tar, and from 5,000 to 8,000 cubic feet of gas, with fuel practices of about 560 pounds of coal. In the plant of the Algoma Steel Corporation a number of heats were made on coke gas alone, with a fuel practice of about 500 pounds of coal. It can, therefore be concluded that the open hearth fuel problem can be solved in a very satisfactory manner, with an ample supply of excess coke gas and tar to allow for slowing down of the furnaces and other emergencies. Also 400 cubic feet of gas can be used per ton of steel for ladle, mold, drying and hot metal mixer.

This use of fuel in the open hearth plant will discontinue the use of producers, which at the present time are more or less unsatisfactory in the production of gas, as the quality and quantity varies over 100 per cent dependent on numerous variables, of which the human element is the greatest.

The proper use of blast furnace gas is not for steam making, although this has been the aim in the past to make such use of it. Should the proposition be advanced to employ producer gas for steam making the question would be dismissed without discussion, as it is well known that no fuel efficiency could be obtained due to the combined losses in efficiency of the producers and the boilers. The use of the coal directly in the boiler would produce more steam than if fired into the producer; why then bother with producer gas? That is the point to be made clear; why bother with blast furnace gas to make steam? It is more valuable for other purposes. Use breeze and waste heat boilers for that purpose. In the above calculations it was shown that 176 pounds in equivalent coal in nut coke and breeze was available from a ton of coke, or for a ton of rails at the rate of 4 pounds of coal per boiler horse power and this will produce 44 boiler horse power. Also it is possible to secure 40 boiler horse power from the use of waste heat boilers. This will be ample for, all purposes where steam is required. The other necessary power may be derived from electricity generated by other means. The blast furnace is the only gas producer which should be tolerated in a steel plant, as the gas produced is of fairly uniform quality and the quality is satisfactory for all the purposes in reheating furnaces, soaking pits and other places where producers have long been used. It will be necessary to clean the gas and distribute it under a relatively high pressure with sufficient holder capacity, but these problems have all been solved in many plants. Also the use of blast furnace gas has been adopted for reheating furnace to some extent, and the experimental stage has been passed. It has been shown that 307 pounds of coal equivalent value is produced by surplus blast furnace gas, and that only 267 pounds were needed in the reheating furnaces. This practically balances the account of blast furnace gas.

In our problem we have not mentioned the fuel required for heating purposes, as this varies throughout the year, but for the six months of winter it will average 20 b.h.p., hours, with a fuel requirement at the boilers of 80 pounds of equivalent coal. It also requires 70 pounds of coal for the transportation of products needed in the production of a ton of rails. This fuel will of necessity be a good grade of coal.

It has been shown that the by-product fuels produced in the manufacture of a ton of rails will not be sufficient to supply all of the heating and power requirements that enter into the production of the rail from the raw products, 336 pounds of additional fuel will be required in the open hearth furnaces per ton of rails, or if all of the coke oven gas is utilized and the fuel practice improved thereby; 173 pounds of coal equivalent will be needed to heat the coke oven batteries. This fuel can best be supplied by blast furnace gas. The necessary additional amount of which could be obtained by the production of 15 per cent more iron than is used in a ton of rails.

By adding 15 per cent extra iron from the blast furnaces to that required for a ton of rails we will have the following fuel balance.

Coal required in pounds		Surplus or by-products obtained. Coal equivalent in pounds.
Coal at coke plant	2,300	
Blast furnace coke		1,536 coke plant.
Breeze		199 coke plant
By-product gas		542 coke plant
Surplus blast furnace gas		529 blast furnace
Steam — open hearth		160 waste heat
Coal for transportation	70	
Total fuel	2,370	2,966

Fuel requirements for	Coal equivalent in pounds
Heating coke ovens	200 blast furnace gas
Reheating furnaces	267 blast furnace gas
Open hearth furnaces	542 coke gas and tar
Blast furnace	1,536 coke from coke ovens
Steam power and heating	160 waste heat, boilers
Steam power and heating	202 breeze
Total fuel requirements	2,907
Excess fuel for other purposes	59

Accident Prevention in Industrial Plants

The importance of Accident Prevention as Demonstrated by Results of Campaigns in the Cement Industry.

W. G. H. Cam, E.E., A.M.E.I.C.

Electric and Power Engineer, The Canada Cement Company, Ltd.

Paper read before the Montreal Branch, The Engineering Institute of Canada, February 21st, 1922.

Among world movements which have changed the meaning of life in a revolutionary manner, few can compare with modern industry. Before the industrial era was the period of craftsmanship, when each worker exercised his handicraft in his home and the excellence of the product was a matter for family pride. People that had a trade, lived, worked and died under the same roof where they were born and very likely their parents and grandparents too. This was the good old order of things, respect for which led the Lancashire cotton spinner to wreck the first power-looms, and craftsmanship has been fighting a losing battle with the factory idea ever since, till now it is almost annihilated.

The advantages at which modern industry aimed have been attained. Uniformity of product, cheapness of product, world-wide distribution and interchange of commodities, a higher standard of comfort made available to more people, all these material advantages have been obtained, and permit one to regard industry, ideally speaking, as synonymous with social service. But while the eyes of the masters of industry were fixed on the guiding star, "production", other things happened, which were bound to happen, but had not been taken into account. The factory, aiming at low cost of manufacture, located near the city, which offered easy transportation, cheap labour, and a local market. The workman, for convenience sake, elected to find living quarters as near the factory as possible.

The sequence of events, fluctuation of labour demand, rapacity of landlords, influx of lower-grade workingmen, and degrading domestic circumstances, produced the slum areas in our great cities. Children reared in necessarily unhealthy surroundings, underfed, half-educated and diseased, grew up to propagate their species. The discards of industry, the maimed and over-age were thrown on the community, which in a bewildered and disorganized way gave them occasional support by way of charity. For many years factory management ignored these things which were the by-product of modern industry, and continued to treat their workers as manpower to be purchased as required in the interests of economy of production, like any of the raw materials of manufacture. This was the state of affairs which produced the hard hearted and inhuman factory superintendent, and bred mistrust, suspicion and defiance in the worker. This gave rise to the mistaken theory that in industry, capital and labour are enemies, a theory which has been used extensively by labour agitators and trade unions.

Present day factory management however takes a broader view of its problems, and the community is now awake to the social evil that has accompanied the progress of industry. Labour is no longer amenable, as it used to be. The fathers have eaten sour grapes and the children's teeth are set on edge. Management is now fully aware that the best economy in industry is obtained by treating the workman as a potential partner in the business, by removing as far as possible the fear of unemployment and of the destitution it entails, by providing him a house to live in, educational facilities for his children and himself; by protecting him and teaching him to protect himself from the hazards of his employment, and providing for his maintenance in old age. This is the way in which modern management is bidding for the employee's confidence, but in the light of the past history of industry it can hardly be wondered that the workman is slow to respond; suspicious of labour saving machinery, mistrustful of welfare work, and profit-sharing or bonus schemes. However there is a response, and in no way has it been more evident than in the success of properly organized accident prevention work.

Accident Frequency in the United States

During the week of August 22nd to 28th, 1921, there were 1,208 persons killed by accidents in the United States. It is a notable fact that automobile accidents form 26 per cent of this total, railway accidents 21 per cent and drownings 12 per cent. Industries contributed only 29.7 per cent of these fatalities, but it is industrial plants that offer the most favourable field for the work of accident prevention. Industries, then, killed 359 people in the United States in one summer week.

Turn your thoughts for a moment to consider how the untimely death of one man may involve the distress and misery of numbers of innocent sufferers, and you will quickly realize what a volume of domestic tragedy may underlie the cold statement of fact which statistics here afford us.

The elimination of this industrial death roll is a cause which must appeal to every man who values his own life — and most of us do — furthermore it is an ideal towards the attainment of which every man of us, engineers or employers of labour, can contribute his efforts.

Principles of Accident Prevention

In the prevention of accidents in industrial plants there are two lines of attack each of which at one time or another in the history of accident prevention has been hailed as a cure-all to the exclusion of the other. The two slogans are, "Make your plant safe," and, "Make your men safe."

Experience shows that the extremists on both sides are wrong. There is no such thing as a safe plant, and, more obviously, there is no such animal as a safe man. One can design a plant to make it as safe as possible,

and one can train a man to be as careful as possible and the way of safety is to attack the problem from both sides at once.

Statistics in the Cement Industry

In the cement industry, with which the writer is most familiar, we have analyzed causes of accidents for a number of years and the writer proposes to present certain facts which have been ascertained and draw the appropriate conclusions regarding the part which the engineer and the operating foremen respectively may assume in the common cause of accident prevention.

In tabulating accident reports, account is taken only of such accidents as cause a loss of time to the worker, and accidents are weighted according to the time loss which each involves. Fatalities are separated out and analyzed apart from the general list. The following is a typical report by the Portland Cement Association on causes of accidents covering one year:—

Analysis of Accidents Covered One Year

Average number of men employed 18,400

Causes of Accidents	Number of Accidents	Number of Days Lost	Average Days Lost	Permanent Disabilities
Ailments in course of work......	15	195	13.0	
Animals, injured by............	13	191	14.7	
Articles in hands of injured.....	79	805	10.2	2
Articles in hands of other person	46	548	11.9	
Caught between objects or parts	150	1871	12.5	7
Clothing caught in machinery..	6	392	65.3	1
Contact with hot material......	99	1670	16.8	
Electrical equipment...........	40	630	15.7	
Explosions.....................	56	1866	33.3	2
Falls due to defective platforms	49	1350	27.5	
Falls from machines, etc........	33	755	22.8	
Falls through unguarded openings....................	21	305	14.5	
Falls due to tripping and slipping.......................	159	3459	21.7	2
Falling or sliding objects.......	515	7757	15.1	6
Flying material................	330	2607	7.9	6
Machinery......................	137	3506	25.5	21
Machine or appliance part broken........................	189	2928	15.6	2
Belts..........................	59	1777	30.1	1
Gears..........................	30	1239	41.3	13
Pulleys and sheaves............	13	392	30.1	1
Shafts and couplings...........	10	268	26.8	
Sprockets and chains...........	14	193	13.7	2
Rolling stock..................	248	5923	23.8	16
Sharp edges or points..........	98	849	8.6	
Striking self against parts......	46	796	17.3	
Strains from lifting...........	133	1545	11.6	
Suffocation....................	5	24	4.8	
Horseplay......................	4	96	24.0	
Miscellaneous..................	71	813	11.4	
....	2668	44750		

Among causes of accidents in this tabulation, "falling or sliding objects" heads the list. Out of 18,400 men employed continuously during the year, 515, or one in thirty-six, suffered injury from falling or sliding objects. This is a cause of injury which can be eliminated by training the men in carefulness and by insisting on cleanliness in the plant. The engineer has very little scope here and the remedy is in the hands of the superintendent, foremen and sub-foremen and the individual worker.

The cause that comes second in frequency is "flying material" with 330 accidents, mostly light, for the average number of days lost is only 7.9. These will be principally eye accidents, indicating the importance of wearing goggles or masks when exposed to hot clinker dust or cement dust, steel chips in the machine shop, splashes of molten metal and similar flying material. This again is a matter to be tackled by discipline and training. Goggles are provided and the men must be persuaded that it is desirable to wear them, or, if necessary, penalized for not doing so.

Rolling stock is responsible for 248 accidents with an average loss of over three weeks time. Here it is the business of the engineer to see that maintenance of rolling stock and tracks is not allowed to slide, and that necessary warning signs and proper lighting at switches and cross-overs is provided. The plant organization is responsible for stopping dangerous practices such as stealing rides, and for educating the men not to take risks in coupling cars, and in dumping. Careless coupling caused five permanent disabilities in the list, mostly lost fingers.

Accidents with gears are usually serious. Among thirty accidents recorded, thirteen caused some permanent disability, the loss ranging from "end of one finger" to "the whole arm", Gears should be guarded: this is not proof against gear accidents, but it helps.

Passing to the record of fatal accidents, causes are stated as follows:—

Belts:—Belt broke, striking man and fracturing skull, one; stepped on or fell on belt, one; found dead near belt, one; cleaning clay off conveyor belt and shovel broke, one; dressing belt, can caught in wheel, one; struck by belt and skull fractured, one.

Coal Dust:—Exploded, causing death, three.

Clothing Caught:—Collar on shaft, one; line shaft, one.

Electrical:—Contact with trolley rail, one; contact with live wire one; exact cause unknown, one; found lying on feed wires, one.

Explosives:—Springing hole using very short fuse, one; tamping powder and it exploded, seven.

Falls:—Slipped and fell on flywheel, one; fell off dam and drowned, one; fell into clay bin, suffocated, one; fell backward and struck head on concrete floor, one; fell through opening in roof, one; lost balance, fell backward eight feet, one.

Gases: Asphyxiated by gases in kiln hopper, one.

Machinery:—Stepped into screw conveyor, four; sitting on crane, when cab swung around, one; repairing inside of the tube mill, and mill was started, one; killed by belt conveyor, one; caught on driving sprocket, one; pinion bumped out of mesh, causing elevator to run backwards, one; chain broke, pulling man around shaft, one.

Rolling Stock:—Car on incline ran over man, one; caught between cars, two; falling under wheels, one; stepped in path of cars, two; fell from handcar, one; fell off car, one.

Slides of Material:—Stone storage bin, one; cement storage bin, one.

Stones Falling:—Rock fell from face of quarry, one.

Miscellaneous:—Found dead, causes not known, two.

Total, fifty-three.

Analyzing these fatal accidents, we have been able to assert with a reasonable degree of certainty that 15.5 per cent only were unavoidable, 14.1 per cent were due to lack of proper supervision, 19.7 per cent due to lack of proper safeguards, and more than 50 per cent were to be blamed to the workmen themselves.

It must be borne in mind that these statistics refer to only one industry, and are compiled from one year's reports of only seventy-two Canadian and American companies in that particular industry. It is safe to say that in the matter of accident occurrence the general conclusion regarding responsibility will be found more or less the same in any industry, and the methods of attacking the problem of accident prevention are of universal application.

What the Engineer can Accomplish

An engineer's object, as a rule, is primarily to lay out an economical plant, to arrange his machinery con-

veniently but compactly, to cut down expense, and to design the mill in such a way that the flow of raw material entering and finished goods issuing may be continuous and regular. The human labour that has to enter into the process of manufacture, is one of the engineer's troubles and, while reminding him of the limitations of his science of mechanics, is constantly tripping him up in his design, and introducing requirements which have no direct relation to the economical lay-out of his plant from the standpoint of mechanical efficiency. Hence the engineer is led to study his design also from the angle of human efficiency.

Human efficiency in industry depends on a number of things but among the bad influences, fear of one kind or another is the worst. This may be fear of bodily injury, fear of injustice or violence, fear of unemployment, fear of ill-health or fear of old age. It is the engineer's business to eliminate from these fears, the fear of bodily injury and the fear of ill-health. He should lay out his machinery with all hazards, mechanical, electrical or chemical, properly guarded. He should provide ample and clearly defined alleys, and walk-ways guarded with rails and toe-boards. His alley-ways and walk-ways should be free from slipping and tripping hazards, his stairways convenient and safe, his artificial lighting ample and properly distributed. He should consider the comfort and safety of the oiler and make all bearings accessible. Portable ladders should be classed as emergency apparatus. He should provide lifting beams or travellers for handling repairs of heavy machinery. The engineer should study also to preserve the health of the worker, providing proper ventilation and heating, lavatories and lockers, first aid and hospital accommodation, drinking water, lunch rooms or club house facilities, and other creature comforts. Provision of all these features in a plant lay-out costs money, but it is an investment which earns dividends. As an example of the effect of eliminating fear of injury on small piece work, might be cited the experience of the Cutler Hammer Manufacturing Company, who by adding a safety feed to a certain punch press reduced the production cost of the piece from 32 cents to 8 cents per thousand.

In the branch of accident prevention over which the engineer has at any rate partial control must be included occupational hazards. In a pamphlet entitled "Occupational Hazards and Diagnostic Signs", prepared by Dr. Dublin and Mr. Leiboff for the Metropolitan Insurance Company, health hazards are listed under the four principal heads of dust, heat, humidity and poison. After giving a tabulation of the diseases incurred and the industries or occupations giving rise to them, the writers append a list of over 500 industries or occupations involved. This demonstrates the magnitude of the problem before us as engineers when we set out to remove the fear of bodily injury from the worker in industry. The article referred to will be found in the United States Monthly Labour Review, March 1921, page 158, and gives an appalling catalogue of the dangers to which the health of the worker may be subjected in various industrial occupations.

The Safety Engineer

The man who aspires to be safety engineer in any manufacturing organization is choosing a profession of absorbing interest and incalculable service to humanity. The men at the head of the profession are men of high ideals, based on a record of service which has enlarged instead of decreased their faith in those ideals. One of these men, Charles Close, manager of the Bureau of Safety Sanitation and Welfare of the United States Steel Corporation recently said, "I believe the day is coming when we will have no accidents in industry. You and I may live to see that day. But to bring that about we have to develop a new generation of workmen. We must train the child so that he will develop habits of safety. We must do more than show him the safe way of doing things once, twice, or ten times. We must teach him the safe way of doing things *every day*, so that when he comes into the shop as a workman, he will habitually do the safe thing just as his father to-day habitually does the unsafe thing."

One must guard against the impression that safety engineering is a side line. It is no more a side line than surgery is a side line in the doctor's profession. The safety engineer must be a good engineer with a broad general education, but he needs special training and experience in hazards and in the special hazards of the industry to which he is allied. He has to be a good mixer, something of a diplomatist, and a confident speaker on occasion. If to these attributes he can add from his personal character an infectious spirit of enthusiasm, and a profound conviction of the paramount value of human life and health, there is no limit to the value that will be placed on his services, and to this material consideration will be added the satisfaction of a life of tangible service to humanity.

Accident Prevention Campaigns

The motives underlying the initiation of a campaign for accident prevention are various. The earlier attempts of legislation to protect the worker in industry took the form of Employer's Liability Acts, and this class of legislation trained the manufacturer to regard accidents as matters about which secrecy should as far as possible be preserved, and they were afraid to guard or improve the protection on machines after an accident had occurred, lest this action should be used against them as evidence of improper conditions increasing their liability.

So, though many manufacturers now regard the problem from the standpoint of general plant efficiency, decrease of labour turnover, and improvement of industrial relations, there are still those whose attitude is merely "we are paying too much for insurance." With this latter type of employer the safety engineer has for his first job to convert the management. He must get them to accept the slogan "Safety before production", and to implement it by a promise of the necessary appropriations for remedying existing unsafe conditions. The superintendents will take their cue from the management, and from them the idea will filter down through the whole organization.

Having enlisted the whole-hearted support of the management, the next step is to form at each plant a central committee consisting of the superintendent and three or four of the senior foremen to dictate policy, and give decisions on the suggestions for safety proposed by the employees. At the first meeting of this committee the superintendent should submit a draft of a letter to be sent to every employee in the plant over his signature, stating that it is the desire of the company to make next month a *no accident month,* and appealing for his co-operation. A letter of this kind issued to employees at one of our plants read as follows:—

Dear Sir:—

At 7 o'clock on the morning of July 1st we are going to make a new start in our *Accident Prevention* work. I want to ask you to give us your earnest assistance in a campaign to go through the month of July without a single accident causing lost time.

Let's make July a "*No Accident*" month. Other Plants have done it. Why cannot we? Remember it is better to be careful and safe while doing your work than to suffer and be sorry after you have been injured.

Take no chances. Always follow the safe course and, if you see any of your fellow employees needlessly exposing themselves to danger, be sure to call the attention of your "*Safety Committee Man*" to their course and, by all means, point out to them why they are liable to be injured. They will appreciate your friendly interest, and you may save them from serious injury.

We are willing to do our part to make your job safe, but remember, we cannot possibly succeed unless you do your part. As you receive your brass check each day, resolve then and there that you will be careful. Do this every day and I believe we can make July a real "*No Accident*" month.

Yours for success,

There is abundant evidence that a letter of this kind is the right first step in interesting the employees at large in an accident prevention campaign. Personal letters from the superintendent of a plant are not frequently received by the rank and file of the employees, and those who cannot read English, keep the letter, and get someone to translate it for them, thinking generally that it may be notification of a shut-down or something unpleasant of that sort.

Simultaneously with the distribution of this letter, a start should be made on the preparation of a series of bulletins featuring the *no accident* month. A different bulletin should be provided for each day of the month, and bulletin boards set up in ten or more different locations about the plant. A blackboard bulletin near the check office can be used to chronicle progress from day to day, and local artists can device extempore pictures of accidents or hazards, to keep the men interested in the board. The National Safety Council of America provides a bulletin service for its members, and many useful pictorial posters can be obtained from them, but nothing really catches on as well as the home-made bulletin.

The next step is the foundation of mill committees consisting of about three members each, for each department or group of departments in the mill. These men work as inspection committees and report on dangerous conditions, and especially on dangerous practices, besides warning their fellow-workmen. They investigate all serious accidents, and near accidents, and submit reports and recommendations. A few days before the first of the month, a joint meeting of the central and mill committees should be held, an address being given by some safety engineer who can speak from experience of *no accident* month in other plants in the same industry. Weekly meetings of the safety committee comprising the mill committees, presided over by the local safety engineer or by a member of the central committee should be held during *no accident* month.

Experience has shown that in most cases there is a reduction of 60 to 75 per cent in accidents during *no accident* month, and in a group of half-a-dozen plants there are always one or two with a clear record for the month. In a recent campaign in my experience comprising eight plants of the Alpha Cement Company, five had a clear record for the month, and the other three totalled five accidents with 55 days lost. The previous year in the same month they had 32 accidents with 7 2 days lost.

Statistics

With regard to statistics of industrial accidents, neither in Canada nor in the United States are the figures available, reliable or complete. In the United States, according to the Labour Review there is no uniform method of tabulating statistics of accidents for the entire country, and few states can be said to have accurate knowledge of the total number of accidents occurring in the industries within their borders. About half the states have no classification of accidents to the industries affected, and very few analyze them by cause and severity.

There is an absence of uniformity in reporting laws and practices, and consequently incomplete reports from many states, and lack of uniform tabulation of data. Until uniform state legislation makes it compulsory for any employer of labour, large or small, to report his accidents on a standard form to the State Workmen's Compensation Board it will be impossible to arrive at the determination of accident rates, which is so necessary for effective accident prevention work. The National Safety Council which was formed in 1913 and now includes over 4,000 United States manufacturers in its membership, has done splendid work in the discussion and elimination of hazards in industry, and in popularizing safety work among its members and the public at large. The American Engineering Standards Committee is working on the preparation of a comprehensive set of safety codes for the guidance of state commissions. In the preparation of this "National Safety Code" the committee is securing assistance from the American Society of Safety Engineers which has elected code committees to discuss the various hazards and report. As far as the writer is aware, however, no advance has been made recently towards uniformity in the requirements of state compensation acts and workmen's compensation boards.

Compensation Boards in Canada

In Canada, the province of Quebec was the first in the field with a Workmen's Compensation Act in 1910, followed by Ontario in 1915, and by the other provinces later. However, Quebec balked at putting the administration of the Act in the hand of a commission although the other provinces did so. Exactly why a public utilities commission should be all right and a workmen's compensation commission all wrong, is a psychological question difficult to decide. The point of view is that under commission management the cost of administration would be excessive. But this is not the verdict of Ontario manufacturers, who are grouped in an Accident Prevention Association authorized under the Act. Their annual report for 1920 shows an average assessment of $1.25 per $100 of pay roll for all industries with a total pay roll of about 436 million dollars. Benefits under the Act were 7¾ million dollars including 2¼ million for retroactive pensions. Cost of administration of the Act was $125,000 of which $45,000, or about one-third, was paid to safety associations for accident prevention work. The number of workers protected amounts to about 350,000, so the administration cost of the Act is 36 cents for each man on the pay roll, including safety association charges.

An association of Workmen's Compensation Boards has already been formed, and as soon as Quebec comes into line, the statisticians of this association will be in a position to standardize the methods of accident reporting throughout Canada. Thereafter the hazards of each industry will be measureable, and the safety engineer will no longer be fighting in the dark for there will be a basis of comparison for the progress of every plant and every industry in the cause of accident prevention which is also the cause of humanity.

Report of Committee on Classification and Remuneration of Engineers

Published by authority of Council for the information of the members of The Institute with a view to discussion and consideration by Branches regarding its adoption by The Institute. The columns of The Journal are open for discussion by individual members.

The Council of 1920 approved of the establishing by The Institute of rates of remuneration for its members both by fee and by salary, it being added in a resolution "which rates The Institute will endeavour to uphold".

This report relates to the annual compensation of engineers and to the classification of those not in consulting practice. It has been received by Council, has already been referred in confidence to the Branch Executives, and is now being published on the authorization of Council for the information of the membership at large. It is anticipated that discussion on this report will take place in the various Branches during the coming months, and that every Branch will go on record as to the wishes of the Branch regarding its adoption by The Institute or otherwise. As indicated in the report, the second part, relating to fees for special work, particularly that of a consulting engineering nature, will be presented by the committee to Council at an early date. The whole subject is of the utmost importance to the engineering profession.

To the President and Members of Council,
The Engineering Institute of Canada:

The Committee was constituted by resolution of Council dated March 23, 1920. Progress reports have been submitted from time to time.

The report of your Committee is divided into two parts:

Part I — Relates to annual compensation.
Part II — Relates to fees for special work, particularly that of a consulting engineering nature.

The final report of Part I herewith is submitted. Part II will be prepared in the immediate future.

Your Committee, in preparing this report, has had before it the reports of the Toronto, Winnipeg, Vancouver, Saskatchewan, Quebec and Halifax Branches of *The Engineering Institute*, that of the British Columbia Technical Association, reports of certain of the societies of the United States, as well as that of Engineering Council of New York. It has also availed itself of the information to be obtained from time to time in the technical press. Full consideration has been given to the classification of the Dominion Government engineering and allied services made under the supervision of the Civil Service Commission of Canada.

Classification

Your Committee realizes that the first essential towards any concerted or general effort on the part of the engineering profession in Canada towards proper compensation for its services is a standardized classification with accompanying rates of remuneration. It has, therefore, been the main purpose of your Committee to evolve an appropriate classification and scale of remuneration. After a careful study of the several reports, that proposed by the Engineering Council recommends itself to your Committee and, with some alterations, has been adopted as the basis of this classification. The subdivision into professional and sub-professional service has been discarded as it was felt to be impossible to draw any marked distinction between them, and that there was no advantage in doing so. This required a certain revision of grades V, VI, and VII in regard to duties and qualifications. Another slight revision has been made to give the college graduate less advantage over the non-graduate with experience for the first year or so after graduation, and a greater advantage thereafter until the higher positions are reached. It is felt that for the higher positions a fixed difference in years of experience between the graduate and non-graduate is purely academic but the Engineering Council periods have been retained.

While the names attached by the Engineering Council to the different grades in the classification have been retained, it has been only for the purpose of identifying the different grades by association with a name; the name attached to an engineering position need not necessarily be an indication of the grade that would be accorded that position in this classification. The name of Chief Engineer of a small industrial concern or a small municipality might correspond to grade V or VI in the matter of duties and qualifications. It should be possible, however, from the nature of the duties required and the qualifications demanded for any position, to assign that position to its proper grade in the classification. The list of positions given corresponding to each grade is merely suggestive.

Chief Engineer: There are certain engineering positions of great importance which require men of the highest engineering ability and training and executive attainments and the occupants of such positions your Committee has given the title of Chief Engineer. Such positions are considered as being outside the scope of engineering classification.

The Classification prepared by your Committee is as follows:

Grade I—Assistant Chief Engineer

Duties — To act in administrative charge of a technical organization, or of a main division thereof; to determine the general policies of the organization under the limitations imposed by law, regulation or other fixed requirements; to have final responsibility for the prepara-

tion of reports, cost estimates, designs, and specifications and for the construction, maintenance, or operation of engineering works or projects; to have full charge of the collection and presentation of data for the conduct of valuation proceedings; to conduct or direct the most comprehensive lines of engineering research.

Qualifications — Training and experience of a character to give substantial evidence of engineering knowledge and ability or of executive capacity of highest order along lines of work similar to those involved in the position to be occupied and of at least twelve years' duration of which at least four years shall have been spent in work of a similar character in a subordinate position, and at least five years in responsible charge of important work or projects. Fundamental training equivalent to that represented by professional degree granted upon the completion of a standard course of engineering instruction in an educational institution of recognized standing, or, in the absence of such degree at least four years additional experience. The completion of each year of such standard course shall be considered the equivalent of one full year of such additional experience.

Positions corresponding to this Grade: Assistant Chief Engineer, City Engineer, Superintending Engineer for a Province, etc.

Grade II—Engineer

Duties — Under general administrative direction and within the limits of the general policies of the organization, to have responsible charge of and to initiate and determine policies for a major subdivision of an organization; to prepare for final executive action reports, cost estimates, designs, specifications, and valuation studies and data; to have immediate charge of the construction, maintenance or operation of engineering works or projects of major importance; to conduct or direct major lines of engineering research; or to furnish for execution action expert or critical advice on engineering works, projects or policies.

Qualifications — Active professional practice or executive charge of work for at least eight years, of a character to demonstrate a high degree of initiative and of ability in the administration, design, or construction of engineering works or projects of major importance, of which at least three years have been spent in work of a similar character in a subordinate position and at least three years in responsible charge of work. Fundamental training equivalent to that represented by professional degree granted upon the completion of a standard course of engineering instruction in an educational institution of recognized standing, or, in the absence of such degree, at least four years of additional experience. The completion of each full year of such standard course shall be considered the equivalent of one year of such additional experience.

Positions corresponding to this Grade: Engineer, District Engineer, Designing Engineer, etc.

Grade III—Senior Assistant Engineer

Duties — Under general administrative and technical direction to be in responsible charge of an intermediate division of an organization; to exercise independent engineering judgment and assume responsibility in studies and computations necessary for the preparation of reports; cost estimates, designs, specifications or valuations; to have immediate charge of the construction, maintenance or operation of important engineering works or projects; or to conduct or direct important lines of engineering research.

Qualifications — Active professional practice or executive charge of work for at least five years, of which at least three years shall have been spent in work of a similar character in a subordinate position, with at least one year in responsible charge of work. Fundamental training equivalent to that represented by professional degree granted upon the completion of a standard course of engineering instruction in an educational institution of recognized standing, or, in absence of such degree, at least five years of additional experience. The completion of each full year of such standard course shall be considered the equivalent of one year of such additional experience.

Positions corresponding to this Grade: Senior Assistant Engineer, Division Engineer, Engineer of a Department.

Grade IV—Assistant Engineer

Duties — Under specific administrative and technical direction, to be responsible for the conduct of the work of a minor subdivision of an organization, to collect and compile data for special items of engineering studies; to take immediate charge of field survey projects and of the design and construction of engineering work; to lay out and develop work from specifications and to supervise the work of draughting or computing force; or to conduct specific tests or investigations of apparatus, materials or processes.

Qualifications — Experience for at least three years of which one year shall have been spent in duties of a similar character in a subordinate position. Fundamental training equivalent to that represented by professional degree granted upon the completion of a standard course of engineering instruction in an educational institution of recognized standing, or, in absence of such degree, at least five years of additional experience. The completion of each full year of such standard course shall be considered the equivalent of one year of such additional experience.

Positions corresponding to this Grade: Assistant Engineer, Estimating Engineer, Chief Engineering Draughtsman, Engineer on Construction, etc.

Grade V—Junior Assistant Engineer

Duties — Under immediate supervision to take charge of squads in draughting office; to direct work of field party on surveys or construction; to direct the work of computing surveys, estimates; to design minor engineering works; to compute and compile data for reports or records; to investigate minor details of engineering work; to perform tests of apparatus, material or processes; to have charge of inspection of engineering works under construction.

Qualifications — Experience for at least two years in duties of a similar character in a subordinate position. Fundamental training equivalent to that represented by professional degree granted upon the completion of a standard course of engineering instruction in an educational institution of recognized standing, or, in absence of such degree, education equivalent to graduation from a high school and at least four years of additional experience. The completion of each full year of such standard

course shall be considered the equivalent of one year of such additional experience.

Positions corresponding to this Grade: Junior Assistant Engineer, Inspecting Engineer, etc.

Grade VI—Junior

Duties — To supervise the plotting of notes and maps, to perform work involving the use of surveying, measuring and draughting instruments; to take charge of parties on survey or construction work; to design details from sketches and specifications; to compute and compile data for reports or records; to inspect or investigate minor details of engineering work; to supervise construction or repair work; to check plans, surveys and other engineering data.

Qualifications — Experience for at least one year in work of a similar nature in a subordinate position. Fundamental training equivalent to that represented by a professional degree granted upon the completion of a standard course of engineering instruction in an educational institution of recognized standing, or, in the absence of such degree, education equivalent to graduation from a high school and at least three years of additional experience. The completion of each full year of such standard course shall be considered the equivalent of one year of such additional experience.

Positions corresponding to this Grade: Senior Draughtsman, Inspector, etc.

Grade VII—Senior Aid

Duties — To prepare general working drawings where design is furnished; to plot notes and prepare maps; to design simple structures; to make computations and compile data for reports and records, to prepare routine tests of apparatus or materials, to run surveying instruments and to adjust and care for same; to compute surveys and estimates; to make minor engineering computations; to inspect incidentally construction or repair work.

Qualifications — Experience for at least two years in work of a nature to qualify for this grade. Education equivalent to graduation from a high school and familiarity with the use of the slide rule and of logarithmic and other simple mathematical tables. The completion of each full year of a standard course in an educational institution of recognized standing shall be considered as the equivalent of one year of the experience otherwise required.

Positions corresponding to this Grade: Draughtsman, Leveller, Transitman, etc.

Grade VIII—Junior Aid

Duties — To trace and letter maps and plans; to make simple drawings from sketches and data; to make minor calculations; to run tape or levelling rod; to perform other miscellaneous subordinate duties in survey party in field or office, as directed.

Qualifications — Education equivalent to graduation from a high school.

Positions corresponding to this Grade: Tracer, Chainman, Rodman, etc.

Remuneration

In arriving at a scale of remuneration, your Committee has paid particular attention to the report of the Branches of *The Engineering Institute* as representing the opinion of the members of *The Institute* throughout Canada as to what would be a reasonable rate of compensation for engineering services in salaried positions. These reports show a very wide range in the salaries proposed, especially in the higher grades and the variation does not appear to be a question of location or the section of the country in which the report was made. The difference of opinion of different groups of men is very well exemplified by the report of the Vancouver Branch where the scale of remuneration proposed by a committee appointed by the Branch was raised from fifteen to twenty per cent, for the intermediate grades at a general meeting of the Branch.

In this report no attempt is made to give different salary schedules for different services such as "Railroad", "Municipal" or "Industrial". Duties of the same nature, or work of the same grade should command the same remuneration, other conditions being the same, whether the work is being done in the service of a railroad, a municipality or an industrial concern. The range between minimum and maximum in the salaries suggested allows latitude for the difference in the abilities of occupants of the same position in the lower and intermediate grades. Your Committee feels that it would not be warranted in suggesting salaries for the higher grades beyond stating what it thinks to be a reasonable minimum.

While the rates of remuneration proposed in this report may seem too low to many of the members of *The Institute*, your Committee felt that it would be advisable to be moderate in the first scale, that there would be danger of defeating the object for which the schedule is designed if too high a rate were proposed. Demands to an employer which to him seem unreasonable will receive but slight consideration. Nor can there be any hope of making a schedule effective if it is so high that many of the members of the profession who are not members of *The Institute* would be satisfied to accept positions at a lower salary than that proposed by the schedule.

On the other hand your Committee is of the opinion that the salary ranges for the different engineering positions in the Dominion Government service are inadequate for the professional qualifications exacted. It would seem that adjustments should be made either to give higher salary ranges for the present specifications, or reduced qualifications for the present salary ranges if it desired to attract and retain a staff of properly qualified engineers in the Government service.

The following table gives the grade, years of experience, with and without a college degree and the proposed minimum and maximum salaries for each grade:—

Grade	Title	Years with degree	Years without degree	Salary Range Min.	Max.
VIII	Junior Aid	0	0	600	1,200
VII	Senior Aid	0	2	1,200	1,800
VI	Junior	1	4	1,800	2,400
V	Junior Asst. Eng.	2	6	2,400	3,300
IV	Asst. Eng.	3	8	3,300	4,200
III	Senior Asst. Eng.	5	10	4,200	5,400
II	Engineer	8	12	5,400	no limit
I	Asst. Chief Eng.	12	16	7,200	no limit

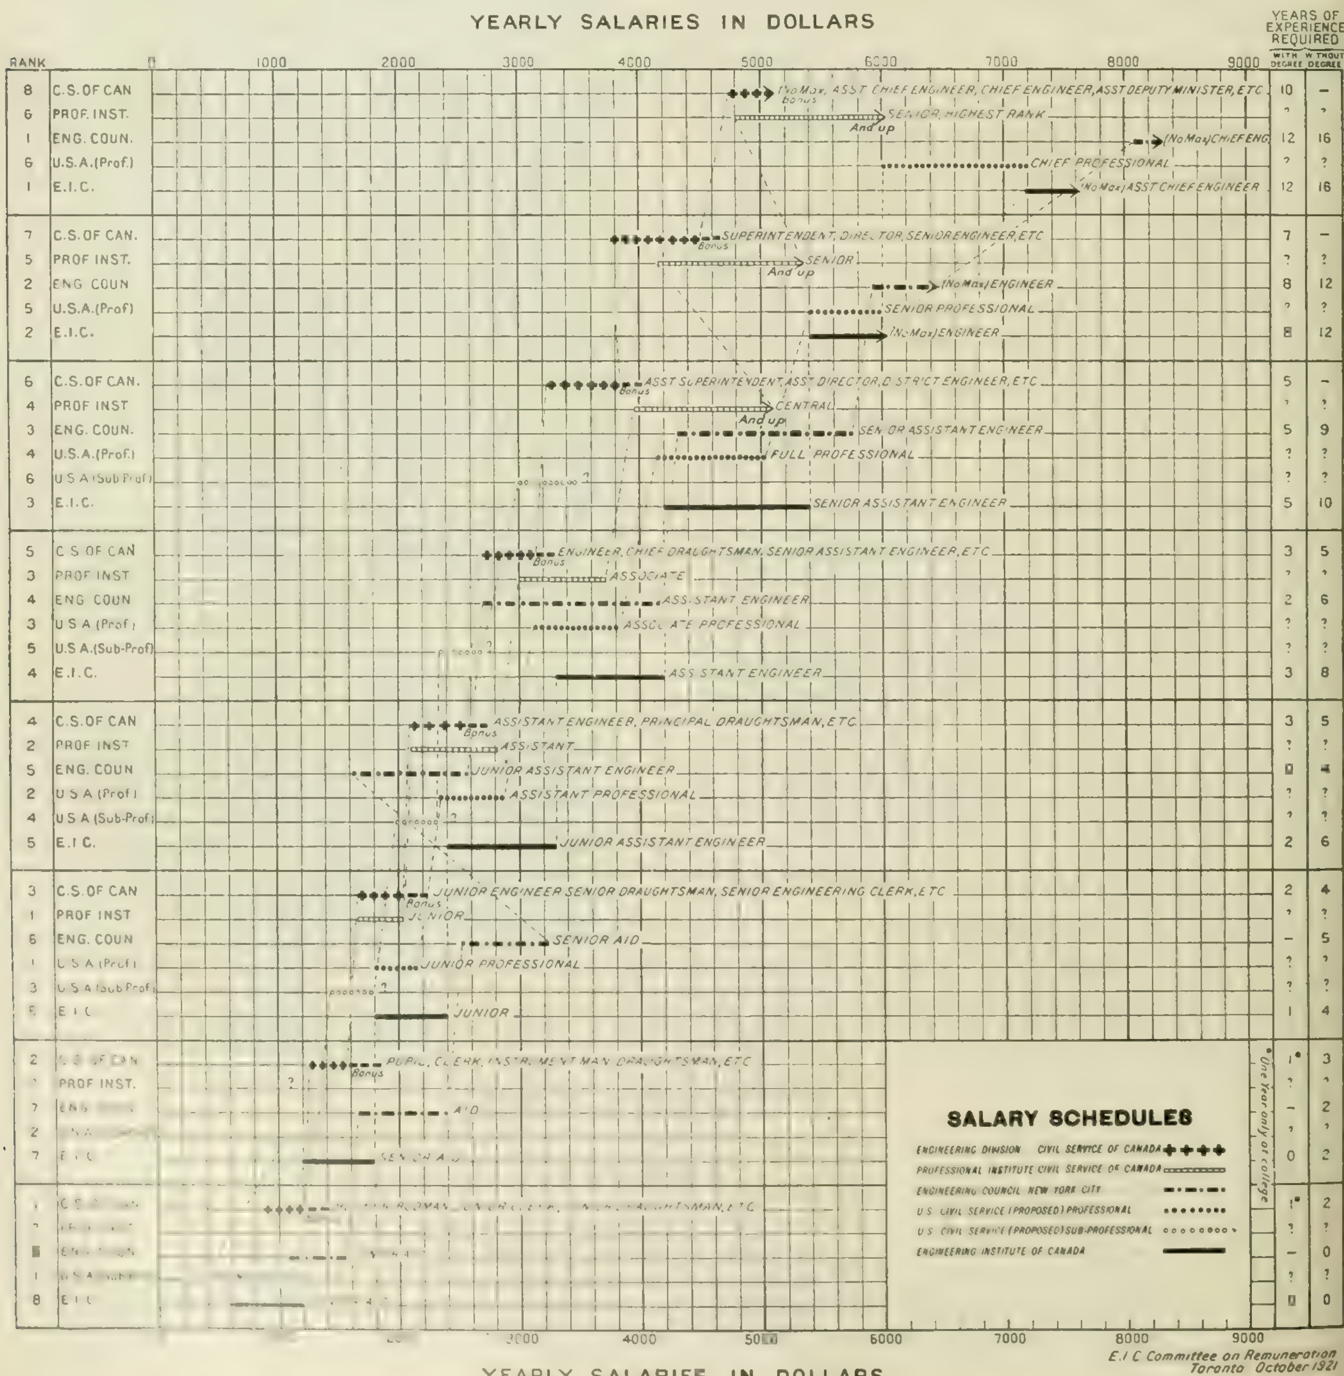
What steps *The Engineering Institute* may take to put this or any other scheme of Classification and Remuneration into effect is not within the scope of this Committee to advise. It is the opinion of the Committee, however, that the larger part of any material improvement must come from the action of the members of the profession themselves. The value the individual member of the profession places upon his services and the remuneration he insists upon obtaining, must, in the long run, be the greatest factor in bringing about a financial improvement in the profession. It is hoped by your Committee, that this report will set an equitable standard for that value, and will be a guide to the members of the profession so that there may be some uniformity in regard to the remuneration asked for the performance of duties of a similar character.

Respectfully submitted,

A. H. HARKNESS, *Chairman.*

Personnel of Committee:—

Chairman, A. H. Harkness, M.E.I.C., Consulting Engineer, Toronto.
Secretary, Frederick B. Brown, M.E.I.C., Consulting Engineer, Montreal.
J. B. Challies, M.E.I.C., Director of Water Power, Dept. of the Interior, Ottawa.
A. R. Decary, M.E.I.C. Superintending Engineer, Prov. of Quebec.
E. R. Gray, A.M.E.I.C., City Engineer, Hamilton, Ont.



Address Wanted

With the compilation of the 1923 Year-Book about to commence and for purposes of general record it is necessary to locate if possible those members whose addresses are not known. Any information regarding the addresses of members on the list printed below will be greatly appreciated by the Secretary.

Members

Aiken, Major A. B.,
Allison, John Logie,
George, F. J.,
MacDonald, Charles, LL.D.,
MacLachlan, J. S.,
Macpherson, Osborne Cluny, (Lieut.),
♂Naish, T. E., (Major),
Ord, L. R.,
Press, William Joseph,

Associate Members

♂Adam, William Alexander, (Capt. M.C.)
♂Adamson, Ernest Kinnear,
Bare, Henry St. John,
Bell, Charles Burnby,
♂Bishop, Reginald W.,
Black, Mogens,
Bourgoing, Sylvio,
♂Bowie, James,
♂Butler, Geo. A.,
♂Caddell, William Persse, (Capt.),
Carlyle, Russell,
Coltman, Walter J.,
♂de Lestang, John M.,
Flood, John Garner,
Goodman, Norbert,
Gorrie, David Francis,
♂Hamilton, George M., (Lieut.),
Hay, William Wren,
Helyer, Maurice,
♂Herren, P. H.,
♂Hodgson, H. M. T.,
Jamieson, Wm. T.,
King, John L.,
Kinnear, Clifford R.,
Mackay, Angus G.,
♂MacKenzie, John A., (Major),
♂MacLachlan, Jas. B., (Lieut.),
♂MacLennan, Alex L., (Capt.),
Marshall, John,
Martin, Louis A.,
McDiarmid, S. S.
McDougall, Alex. L.,
McLean, John Rose, (Lieut.),
Melanson, Hector W.,
Milne, J. E.,
Moffat, Frank P.,
♂Muirhead, Thos., (Lieut.),
Newton, C. A.,
Nowlan, Arthur,
♂Oborn, Stanley Mill,
O'Connor, J. F.,
♂O'Leary, H. Gordon,
Pardoe, Henry M., (Major R.E.),
♂Patrick, K. S.,
Peck, Orwin K.,
Pinch, H. H.,
♂Reid, A. C.,
Rodd, Brent T.,
♂Simpson, Rupert, (Capt.),
♂Smith, A. Parker, (Capt.),
♂Sohier, Raymond,
♂Stavert, Wm. D., (Lieut.),
Stewart, J. Crossley, (Lt.-Col.),
Tilston, John Arthur,
Turner, Stanley Roy,
Wakefield, John Albert,
♂Walker, T. Molineux, (Capt.),
Zverina, Jan.

Juniors

Bathen, Johan,
♂Booth, Chas. D. G.,
♂Brown, Harold Lawson,
Bryant, Earlham,

THE

ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE
OF CANADA

SUBSCRIPTION - - - - - $3.00 per Annum

VOL. V. November 1922 No. 11

Nominations for Officers' Ballot

Within seven days after the first meeting of the Council in October, the Secretary shall mail to each corporate member of The Institute *the officers' ballot, as prepared by the Nominating Committee and the Council.*

Notices shall be deemed to have been mailed to members as prescribed by the By-Laws if such notices are printed in The Journal of The Institute *and mailed by the dates prescribed in the By-Laws.*

The following is a list of the nominees submitted by the Nominating Committee, as required by the By-Laws before the first day of October, and as approved by Council at the regular meeting of Council held on October twenty-fourth:—

President: Arthur St. Laurent, M.E.I.C.; Ottawa, Ont, proposed by Council.

Vice-Presidents: J. B. Challies, M.E.I.C., Ottawa; Geo. W. Craig, M.E.I.C., Calgary; Walter J. Francis, M.E.I.C., Montreal; J. H. Hunter, A.M.E.I.C., Montreal, proposed by Nominating Committee; Major Geo. A. Walkem, M.E.I.C., Vancouver, proposed by Council.

Councillors: District No. 1: Frederick B. Brown, M.E.I.C., Montreal; Col. Arthur E. Dubuc, M.E.I.C., Montreal; C. M. McKergow, M.E.I.C., Montreal; W. H. Winterrowd, A.M.E.I.C., Montreal.

District No. 2: W. D. Baillairge, M.E.I.C., Quebec; A. R. Decary, M.E.I.C., Quebec.

District No. 3: Geo. D. Macdougall, M.E.I.C., New Glasgow; J. D. McBeath, M.E.I.C., Moncton; Frank P. Vaughan, M.E.I.C., St. John.

District No. 4: K. M. Cameron, M.E.I.C., Ottawa; C. P. Edwards, A.M.E.I.C., Ottawa.

District No. 5: W. L. Barns, A.M.E.I.C., Peterborough; Geo. T. Clark, A.M.E.I.C., Toronto; R. L. Dobbin, M.E.I.C., Peterborough.

District No. 6: L. McGill Allan, A.M.E.I.C., Windsor, proposed by Nominating Committee; A. J. M. Bowman, A.M.E.I.C., Windsor, proposed by Nominating Committee; H. B. R. Craig, M.E.I.C., London, proposed by Council; Dr. Geo. F. Porter, M.E.I.C., Windsor, proposed by Council; Frank E. Sterns, A.M.E.I.C., St. Catharines, proposed by Nominating Committee.

District No. 7: E. P. Fetherstonhaugh, M.E.I.C., Winnipeg; Geo. L. Guy, M.E.I.C., Winnipeg.

District No. 8: R. N. Blackburn, M.E.I.C., Regina; L. A. Thornton, M.E.I.C., Regina.

District No, 9: P. Turner Bone, M.E.I.C., Calgary; B. L. Thorne, M.E.I.C., Calgary.

District No. 10: Chas. Brakenridge, M.E.I.C., Vancouver; P. Philip, M.E.I.C., Victoria.

The Policy Committee's Recommendations

Since the publication of the report of the Committee on Policy, in the June number of *The Engineering Journal*, considerable progress has been made in carrying out its recommendations. In general, they divide themselves into those which involve constitutional changes, and those which can be carried out under present by-laws.

With regard to the constitutional changes, the Legislation and By-laws Committee of Council is now engaged upon the preparation of the necessary by-law amendments covering the following matters:—

(1) **The broadening of the Institute's stated objectives.**

(2) **Such internal economy changes as will strengthen the Branches and enable them to articulate more directly with Council, the governing body of the Institute.**

(3) **The making of Council more continuously representative of those centres of Institute activity which do not, on account of distance from headquarters, function directly.**

(4) The payment of mileage to Councillors upon a reasonable basis and within the available income of the Institute.

(5) More generous and general distribution of the high office of Vice-President, with concurrent extension of its usefulness.

It will be readily understood that these recommendations involve fundamental changes of far-reaching importance. Nevertheless Council is determined that they shall be given effect with the least possible delay consistent with the procedure imposed by the present constitution. Changes in by-laws must be discussed at an Annual General Meeting, and then within two months submitted by letter ballot for a mandate of the corporate members.

As the Policy Committee's recommendations have been formally endorsed at two General Professional Meetings, one at Vancouver in June, and one at Winnipeg in September, Council expects that the necessary two-thirds majority will be given the constitutional changes when the ballot vote is recorded.

With regard to the committee's recommendations which do not involve constitutional changes, Council has already:—

(a) Provided for more effective co-operation with sister bodies in Canada and the United States by initiating action through regular channels.

(b) Recognized the basic importance of the engineering educational facilities of the Dominion to the future of both the country and the profession by the appointment of a strong special committee consisting of Messrs. Geo. R. MacLeod, M.E.I.C., chairman, Arthur Surveyer, M.E.I.C., F. P. Shearwood, M.E.I.C., T. R. Loudon, M.E.I.C., A. M. Reid, S.E.I.C., and R. W. Downie, A.M.E.I.C., to take appropriate action to link up the Institute and its facilities with the students in engineering in all Canadian institutions of learning.

(c) Initiated suitable action to secure academic recognition for the engineering profession comparable to that extended to the sister professions of law and medicine by the governing and degree-conferring bodies of our Canadian universities. This is in the hands of a special committee consisting of Vice-President A. Surveyer, M.E.I.C., as chairman; with the chairman of the Committee on Policy, J. B. Challies, M.E.I.C., and the Deans of the Faculty of Applied Science and Engineering of McGill, Toronto and Queens; Dr. F. D. Adams, HON. M.E.I.C., Brig. General C. H. Mitchell, LLD., M.E.I.C., and Dr. A. L. Clark, HON. M.E.I.C.

(d) Referred the duty of analyzing the Institute's Code of Ethics so that it may be more of a positive influence for a broader and a better professional consciousness, to a special committee consisting of Messrs. Arthur Surveyer, M.E.I.C., chairman, F. P. Shearwood, M.E.I.C., and Frederick B. Brown, M.E.I.C.

(e) Taken positive action to secure adequate and just remuneration for engineers, especially the younger members of the profession, by ordering the immediate publication of the progress report of the special Committee on Remuneration.

By every means within its power and with the least possible delay, Council is endeavouring to implement the Policy Committee's recommendations.

Engineer Heads Government Railways

During the past decade the engineering profession has gained considerable prestige from the fact that engineers of eminence have forged to the front with the various transportation systems of the continent and are to-day occupying high executive positions for which they are well qualified. The announcement by the federal government of the appointment of Sir Henry Worth Thornton, K.B.E., an outstanding engineer, as president of the Canadian National Railways system, was noted by members of the profession throughout Canada with no small satisfaction, although it is realized that the position, hampered as it must be to some extent at least, by politics, involves difficulties and problems which only a superman can meet and satisfactorily solve. In spite of his ability and experience, if Sir Henry Thornton is not permitted similar freedom of action to that enjoyed by the president of a private corporation, his genius must be great indeed if he is to achieve outstanding results. In his efforts to accomplish the desired ends he will have the sympathetic interest of his fellow engineers throughout the Dominion.

Sir Henry Worth Thornton, K.B.E., was born at Logansport, Indiana, in November, 1871, and graduated from the department of civil engineering of the University of Pennsylvania with the degree of Bachelor of Science in 1894. After graduation he obtained employment with the Pennsylvania Railroad Company and through various positions of advancement to that of superintendent of Long Island Railroad in 1911, which is part of the Pennsylvania Railroad System. In April 1914 he was called to England as general manager of the Eastern Railway Company which enjoys the largest passenger traffic of any railway in the world, the company operating a line of steamships and operating hotels and dining car services. During the war he was made a member of the executive committee of general managers which, under the direction of the government, controlled and worked all the English railways. In 1916 he became deputy director of inland water transportation with the rank of Colonel in the Royal Engineers, which department handled all the inland navigation in Northern France, Egypt and Mesopotamia.

In 1917 Sir Henry went to Paris as assistant director-general of movements of the railways, representing the director-general of the army council in negotiations with the French, Italian and American governments relating to transportation. In December of the same year he was made deputy director-general of the movements of railways with the rank of Brigadier-General and in 1918 was made inspector general of transportation on the continent. Sir Henry was naturalized as a British subject in March, 1919, and in May of the same year was gazetted a Knight Commander of the Order of the British Empire. He is also a Commander of the Legion of Honour of France, an officer of the Order of Leopold of the Belgians, and a holder of the Distinguished Service Medal conferred by the American government.

OBITUARIES

Alan Timbrell, A.M.E.I.C.

News of the death of Alan Timbrell, A.M.E.I.C., which occurred early Tuesday morning, October 3rd, at Simcoe, Ontario, after a short illness, has been received with deep regret by his many friends in *The Institute* as well as in private life. For the past two years the late Mr. Timbrell had been connected with the engineering service of the Ontario Department of Public Highways, and it was while on this work at Simcoe that he was suddenly stricken with pleuro-pneumonia which resulted in his death.

Mr. Timbrell, was born in India in 1877; his father, the late Colonel Thomas Timbrell, of Tavistock, England, being attached to the Indian forces. He received his early education at Christs Hospital, London, England, and Blundells School, England, and later was successful in all examinations for Fellowship of the Surveyors Institute of London, England. In 1895 he was articled for five years with a firm of mining engineers, land agents and surveyors, in Sheffield, England, and for three years following he was in charge of road construction in England. In 1904 Mr. Timbrell came to Canada and was for a number of years engaged on railway work on the engineering staff of the Transcontinental Railway and Hudson's Bay Railway resigning his position at the outbreak of war in 1914 to go overseas with the Canadian Engineers, with which he served continuously throughout the war. Upon returning to Canada after the signing of the armistice he became connected with the work on which he was employed at the time of his death.

Henry Percy Borden, B.SC., M.E.I.C.

Following an extended illness Henry Percy Borden, B.SC., M.E.I.C., died at his residence at Rockcliffe, Ottawa, on Thursday, October 19th, the news of which will be received with regret by a wide circle of intimate friends and acquaintances throughout Canada, particularly among the profession of which he was a popular and successful member. The late Mr. Borden was born at Port La Tour, Nova Scotia, on December 8th, 1872. He attended Mount Allison University, Sackville, N.B., and later graduated in civil engineering from the faculty of applied science, McGill University in 1902. Following graduation he was employed in the bridge department of the Canadian Pacific Railway, his work dealing with designing of bridges and masonry shop and field inspection, general inspection and the making of reports. In 1904 he was appointed assistant chief engineer of the Locomotive and Machine Company of Montreal, in charge of designing and sales department, in the structural branch. In 1906 he returned to the Canadian Pacific Railway as architectural engineer in charge of designing of steel and reinforced concrete work for that department. In 1908 he was appointed to the staff of the Quebec Bridge Commission as assistant engineer and in 1915 was made assistant to the chief engineer. The following year he was appointed a member of the board of engineers, Quebec bridge, which position he held until the completion of that work in 1918. Following the construction of the Quebec bridge Mr. Borden was retained by the department of railways and canals in a consulting capacity until last year. Later he opened

HENRY PERCY BORDEN, B.A.Sc., M.E.I.C.

an office in Ottawa as a consulting engineer specializing in bridges and structures of steel and reinforced concrete.

The late Mr. Borden was married in 1906 to Edith Eva Hall of L'Orignal, Ontario, who survives him with two daughters. Besides being a member of *The Engineering Institute of Canada*, he was a member of the American Society of Civil Engineers, and the Rideau, Country, and Royal Ottawa Golf Clubs, Ottawa.

Charles Priam Loveland, A.M.E.I.C.

Charles Priam Loveland, A.M.E.I.C., died suddenly at his residence, 36 Sussex Avenue, Montreal, on Thursday evening, October 20th, as a result of a hemorrhage of the lungs. Although the late Mr. Loveland had been ill for the past three years his condition had appeared to be improving until the end came suddenly. Born at Bangor, Maine, on October 18th, 1871, the late Mr. Loveland was educated in Boston, commencing his engineering career with W. C. Bates, C.E., Jamaica Plain, Mass. In 1901 he entered the employ of the Boston Transit Commission as engineering assistant on construction of East Boston Tunnel, continuing in that position until 1907. In December 1907 he was made chief engineer for P. McGovern, contractor, of Boston, on conduit construction, Montreal Water Works. Since then he has continued residence in Montreal later becoming associated with the Leahy Construction Company of which he was president. He was also president of the Great Lakes and Atlantic Canal Power Company and was associated with the J. W. Harris Manufacturing Company, Limited. The late Mr. Loveland is survived by his wife and three sons, all of Montreal. He was elected to associate membership on April 9th, 1910.

PERSONALS

Noël F. Harrison, A.M.E.I.C., has just returned from a trip to Great Britain and Ireland and is now located at Winnipeg, Manitoba.

K. M. Chadwick, A.M.E.I.C., formerly assistant engineer with the Victoria Gas Company is now on a six months trip to the Old Country.

J. S. Macleod, A.M.E.I.C., has been transferred from assistant engineer on the Trent canal to assistant engineer on the Ontario-St.Lawrence canals.

A. W. Hanks, Jr.E.I.C., is now located with the Dominion Bridge Company, Limited, at Lachine, Quebec, coming from the Winnipeg office of the same company.

George Phillips, A.M.E.I.C., has been transferred from the department of Naval Service at Ottawa, Ontario, to H.M.C. Dockyard at Esquimalt, B.C.

George F. Bryant, S.E.I.C., who received his degree of B.A.Sc. in electrical engineering from the University of Toronto, this spring, is now with the Standard Underground Cable Company, Hamilton, Ontario.

Kenneth C. Cairns, S.E.I.C., of Fredericton, New Brunswick, who graduated in electrical engineering from the University of New Brunswick, last May, is now with the New Brunswick Electric Power Commission.

L. N. Jenssen, M.E.I.C., is now located at Warren, Idaho, as resident engineer for Alexander Potter, M.E.I.C., of New York, in connection with work for the Unity Goldmining Company.

E. D. W. Courtice, A.M.E.I.C., has discontinued his private practice as architect and engineer to take charge of the mechanical and architectural drawing at the Hamilton Technical School.

F. H. Kitto, D.L.S., M.E.I.C. exploratory engineer, Natural Resources Intelligence Branch, Department of Interior, has returned to Ottawa after spending the summer on investigation in Nova Scotia.

While in the west recently on an inspection trip A. St. Laurent, M.E.I.C., chief engineer of the Department of Public Works, was the guest of honour at a dinner given by his engineering friends in Vancouver.

J. P. Young, S.E.I.C., of Owen Sound, Ontario, who graduated this year in mechanical engineering at Queen's University, has been transferred by the firm of The Herbert Morris Crane and Hoist Company, from Niagara Falls, Ontario, to Toronto.

H. E. Howden, S.E.I.C., of Caledonia, Ontario, who graduated in electrical engineering at University of Toronto, this year, is now taking the graduate students course with the Westinghouse Electric and Manufacturing Company, East Pittsburgh, Pa.

H. M. Bigwood, A.M.E.I.C., secretary of the Victoria Branch, is just recovering from a motor accident in which he unfortunately sustained injuries to his right arm, which was fractured below the elbow, and also the dislocation of his wrist.

Peter Emslie, A.M.E.I.C., formerly resident engineer in charge of erection of a cotton mill at St. Hyacinthe and power-plant installation in Montreal, for J. M. Robertson, M.E.I.C., consulting engineer, is now located with Currie and Company, Edinburgh, Scotland.

James P. Gordon, A.M.E.I.C., who graduated from the University of Toronto in 1904, and who was for some years resident engineer for Chipman and Power, consulting engineers, Toronto, on waterworks and sewers, has accepted a position with the engineering department of the city of Hamilton.

J. A. McNichol, M.E.I.C., is now with the Toronto Transportation Commission. Before coming to Toronto he was connected with the construction department of the Canadian Pacific Railway at Winnipeg, as resident engineer.

D. M. Mawhinney, A.M.E.I.C., formerly resident engineer under the Manitoba Good Roads Board, at Stonewall, Manitoba, and more recently engineer on paving construction, in Itasca County, Minnesota, has been appointed resident engineer, with the Minnesota Highway Department with headquarters at Lake Benton, Minnesota.

Lt.-Commander C. P. Edwards, A.M.E.I.C., director of the Radio Branch of the Department of Marine and Fisheries, sailed for England on October 20th, to assist the Hon. E. Lapointe, Minister of Marine and Fisheries, in a conference with the Imperial authorities regarding the Imperial chain of high-power radio stations throughout the Empire.

John R. Dunbar, S.E.I.C., of Ottawa, who graduated in electrical engineering at McGill University last spring is now taking the graduate students course at the Massachusetts Institute of Technology. After graduation Mr. Dunbar was with the Geodetic Survey at Truro and later with the engineering department of the Canadian Westinghouse Company, Limited, Hamilton.

L. W. Gill, A.M.E.I.C., graduate of McGill University, who until recently has been in the department of mechanical engineering, University of British Columbia, is now with the Hamilton Technical School, Hamilton, Ontario. Before going to British Columbia, Mr. Gill was professor of electrical engineering at Queen's University, Kingston, and was responsible for the design of the heating and electric plant of that university.

C. V. Von Abo, Ph.D., Jr.E.I.C., received the degree of Doctor of Philosophy from McGill University at the recent convocation, having presented to the Graduate School of McGill, a thesis of exceptional interest on "The present status of our knowledge of secondary stresses in bridges". Dr. Von Abo received his degrees of B.Sc., and M.A., from Cape Town University in 1917 and 1919 respectively.

As a contribution to the relief of Northern Ontario conditions, the firm of Frank Barber and Associates, Limited, have offered to the Government their services and advice in rehabilitation. This offer, submitted through the Government, has been accepted by Mayor LeHeup of Haileybury, and Horace L. Seymour, A.M.E.I.C., town planning engineer of the firm, left for Haileybury on October 12th. While employed on town planning work with the Dominion Government, Mr. Seymour was

engaged in the replanning of the devastated area of Halifax after the explosion there in 1917. He, therefore, goes with experience that is invaluable in the present circumstances.

J. D. Craig, M.E.I.C., who went into the Arctic regions in Canada's interests this season as officer in charge of the expedition sent north by the Department of the Interior on the C.G.S. "Arctic", reports an interesting and successful trip. It is hoped shortly to be able to have for our readers an article covering the trip. L. O. Brown, of the Geodetic Survey staff, accompanied the expedition as surveyor and meteorologist, and Thos. P. Reilly, of the International Boundary Surveys staff, was assistant surveyor. Major R. A. Logan, D.L.S., who was in charge of the ground instructional school at Camp Borden, represented the Air Board, and will report on the possibilities of aviation in the north.

Philip J. Duff, A.M.E.I.C., has recently been elected a member of the Institution of Mechanical Engineers in London. Mr. Duff is now a partner in Alkin and Duff Engineering Company, D5 Clive Buildings, Calcutta, India. Mr. Duff was for many years in Canada on design and construction of pulp and paper mills and other engineering developments. For two and a half years he was resident engineer on the construction of the new Ransome Drifting Sand Filtration plant supplied to the city of Toronto by the Ver Mehr Engineering Co., and during 1917 and 1918 was associated with the Imperial Ministry of Munitions as inspector in charge of graze fuses in Canada.

William S. Wilson, A.M.E.I.C., is now engaged on investigation work with Walter J. Francis, M.E.I.C. Since graduating from McGill University in 1907 he has been engaged with the Tagona Water and Light Company, and Lake Superior Power Company in various capacities, also with the Algoma Steel Corporation, Limited, since 1913. While with the latter company he held various important positions on construction of timber pile docks; inspection of foundations and progress on blast furnace construction and sewers; complicated land surveys; surveys and the preparation of plans in connection with right-of-way purchases; quarry developments studies; land records; maintenance of office buildings and houses; heating plant and fuel conservation studies.

Major L. A. Wilmot, A.M.E.I.C., formerly of Brantford, Ontario, is with the department of Customs and Excise as investigator of values, in London, England. Major Wilmot is an honour graduate of the Royal Military College, Kingston, and received his degree of civil engineer from the University of Wisconsin. For a number of years he has been closely connected with hydro-electric development in Canada having been with the British Columbia Electric Railway as assistant engineer; the Jordan River hydro-electric development, Vancouver Island; assistant engineer with the Western Canada Power Company at Vancouver, B.C.; inspector for the Canadian Light Heat and Power Company at Valleyfield, Quebec, and assistant engineer with the Pacific Great Eastern Development Company.

Colonel J. Houliston, D.S.O., A.M.E.I.C., who has lately been appointed temporary Colonel Commandant of Military District No. 7 with headquarters at St. John, N.B., graduated from the R.M.C., in 1890, and received his commission in the Royal Canadian Engineers in July 1904. He went overseas in May 1915 and was for a time in charge of training at the Canadian Engineers Depot in England. Proceeding to France in February 1917 he was appointed assistant to C.E. Canadian Corps. In April of that year he took over command of the engineers of the 3rd Canadian Division, holding the appointment until July 1918 when he became C.R.E. Canadian Corps Troops. He was awarded the D.S.O. and twice mentioned in despatches. He now vacates the position of director of engineer services on the staff at Militia Headquarters.

New Honorary Member

A. L. CLARK, Ph.D., BSc.,
Hon. M.E.I.C. Dean of the Faculty of Applied Science of Queens University.

At the September meeting of Council, A. L. Clark, PH.D., D.SC., was elected an Honorary Member of *The Institute*. Dr. Clark was born at Worcester, Mass., U.S.A., and received his degree of Bachelor of Science from the Worcester Polytechnic Institute in the year 1894, and his degree of Doctor of Philosophy from Clark University in 1905. Following graduation from Worcester Polytechnic Institute Dr. Clark was engaged for some time in charge of the construction of the plant and mains for the New Rochelle Gas and Fuel Company, New Rochelle, N.Y. In 1906 he was appointed professor of physics in Queen's University and in October, 1920, Dean of the Faculty of Applied Science in the same university. Dr. Clark has been connected with *The Institute* for a number of years as an Associate, besides which he is a member of the American Physical Society; Société Française de Physique; Association Internationale du Froid; American Society of Refrigerating Engineers, and a fellow of the Royal Society of Canada.

Vice-President and General Manager of National Lines.

S. J. Hungerford, M.E.I.C., who has been appointed vice-president and general manager of the Canadian National Railway system, was born near Bedford, Que., in 1872, and commenced his railway work in 1886 as machinist apprentice with the Southeastern Railway and Canadian Pacific Railway, at Farnham, Que., where he worked for five years. For the following three and one-half years he was machinist at various points in Quebec, Ontario and Vermont. From September 1894, Mr. Hungerford was chargeman with the Canadian Pacific Railway at Windsor Street in Montreal. From this date his promotions were rapid. In 1897 he was assistant foreman, Canadian Pacific Railway, Farnham, Que.; three years later locomotive foreman, Megantic,

S. J. HUNGERFORD, M.E.I.C.

Que., and the following year general foreman, McAdam Junction, New Brunswick. In the same year he was transferred to Cranbrook, B.C., as locomotive foreman, and from February 1903 to January 1904 he was located at Calgary, as master mechanic, Western Division, Canadian Pacific Railway. In 1904 he took charge of the Winnipeg locomotive shops as superintendent, which position he held until joining the engineering staff of Canadian Northern Railway in March 1910, with which company he was appointed superintendent of rolling stock with headquarters at Winnipeg; two years later moving to Toronto in the same capacity. In November 1917, he was appointed general manager of the eastern lines of the Canadian National Railway and the following year was chosen as vice-president of Canadian National and Canadian Government Railways.

Heads Ass'n of Canadian Advertisers

H. S. Van Scoyoc, M.E.I.C., of Montreal, was elected president of the Association of Canadian Advertisers, at the annual convention held in Toronto, on October thirteenth. Mr. Van Scoyoc, is consulting engineer in charge of the consulting engineer service and promotion department of the Canada Cement Company, Limited, and consulting engineer to the Toronto-Hamilton Highway Commission. Mr. Van Scoyoc graduated in applied science from the University of Pennsylvania in 1907 and for a number of years was assistant engineer of the city of Altoona, Pa. In July 1912 he was appointed inspecting engineer with the Canada Cement Company, Limited, and in this capacity assisted in a wide variety of concrete work throughout Canada, particularly cement-concrete paving. He was appointed chief engineer of the Toronto-Hamilton Highway Commission in November 1914 which position he occupied until February 1918 when he was appointed to his present positions with the Canada

H. S. VAN SCOYOC, M.E.I.C.
President Association of Canadian Advertisers.
President Montreal Publicity Association.
Vice-President Associated Advertising Clubs of the World.

Cement Company and the Toronto-Hamilton Highway Commission.

Invents overhead carrier for Fire Hose.

J. S. Kingston, A.M.E.I.C., of the engineering staff of the Department of Public Works, has invented a simple portable equipment for carrying fire hose above street traffic. He claims that the equipment can be carried on a brigade wagon and put in operation by two firemen in less than five minutes. The equipment consists of a light steel "H" iron column inserted into a cast iron box or socket, that has previously been imbedded into the road between the up and down railway tracks opposite a fire hydrant, with swivel, hinged joints at its base, also a brass or copper bridge pipe insulated on the exterior with rubber as a means for preventing contact with trolley wires through careless erection. This bridge pipe is inserted into the top of the iron column and by a turn of a screw lever is made rigid, from the street level.

The standard is then raised and when in an upright position, a locking device falls into slots that secure same. The upright column is then turned at the swivel joint on its base by levers, so that the hose bridge is in a transverse position to the line of traffic. A brigade wagon is then drawn near the hydrant and a short section of hose is connected from the fire hose bridge to the hydrant on the one end and a length of one or more lines of hose is attached to the opposite end. Mr. Kingston has been granted a Canadian patent for this equipment, and has applied to the United States and British Governments for similar patents.

G. J. Desbarats, C.M.G., M.E.I.C., to succeed to position of Deputy Minister of Defence.

G. J. Desbarats, C.M.G., M.E.I.C., is to succeed to the position of Deputy Minister of Defence. Mr. Desbarats, who has been for some forty years in the Dominion public service, was deputy minister of the Naval Service when the legislation amalgamating the Militia and Naval departments and air board in one department of defence was enacted last session and became operative. After the amalgamation Mr. Desbarats became comptroller in the department. He was named acting deputy minister of defence when Major-General Sir Eugène Fiset was obliged by ill-health to retire from the office of deputy head of the department. Mr. Desbarats is to succeed General Fiset as deputy minister. Mr. Desbarats entered the public service in 1879, when he was appointed to the

G. J DESBARATS, C.M.G., M.E.I.C.

Department of Railways and Canals. He has since served as inspector of Railway construction in British Columbia on the hydrographic survey of the St. Lawrence river, as director of the Government shipyard at Sorel, as deputy minister of Marine and Fisheries for a period, and as deputy minister of the naval service from 1910 to 1922. In the last-mentioned capacity he was called upon to perform important duties during the war. He was appointed a Companion of the Order of St. Michael and St. George in 1914.

McGill Graduate Appointed Deputy Minister

Douglas Lauchlin McLean, B.SC., A.M.E.I.C., who graduated with honours in civil engineering from the Faculty of Applied Science in McGill 1909 has been appointed deputy minister of public works for the province of Manitoba. Mr. McLean was born at Ottawa on August 20th, 1886, and after attendance at the Ottawa public school and Collegiate Institute spent a year on the National Transcontinental, following which he came to McGill where he was popular with his fellow students. Following graduation he became assistant to J. B. McRae, M.E.I.C., hydraulic engineer, and later was assistant chief engineer for the International Commission. He was then appointed chief engineer of the water power surveys of the Winnipeg rivers, Department of the Interior. At the time of the present appointment Mr. McLean was chief engineer of the Manitoba Drainage Commission. Mr. McLean is an enthusiastic McGill graduate and takes an active part in the engineering profession, being an associate member of *The Engineering Institute of Canada* and taking a prominent part in the affairs of the Winnipeg Branch of *The Institute.*

Development in Peat Fuel Handling

E. V. Moore, M.E.I.C., who for many years has been closely associated with research work in connection with the manufacture of peat fuel, is responsible for the design and installation of the government peat plant at Alfred, which was recently inspected by the Hon. Charles Stewart, Minister of the Interior and of Mines, with officials of the Mines Branch. The crucial problem in the manufacture of peat fuel as pointed out by Mr. Stewart, is one of cost, and this is being solved by the substitution of ingenious machinery for the expensive hand labour formerly employed, so that peat fuel is being sold at five dollars a ton, f.o.b. Alfred. Much of this machinery has been specially designed by Mr. Moore, at the Alfred bog, and hand labour is reduced to a minimum. The peat is dug by a large steam digger operating like a dredge. This is mounted on caterpillar wheels and moves along slowly under its own power as it "eats up" the bog. It also beats up the peat in a power hammer-mill similar to that used in paper making and then passes it on to the conveyor and mechanical spreader.

The total area overlain by peat in Canada is estimated at 37,000 square miles, of which about 12,000 acres of an average depth of 6 feet are in Manitoba, Ontario, Quebec and New Brunswick. Some idea of the enormous potential energy in this, provided the experiments at Alfred are successful in evolving a commercial process of manufacture, may be obtained when it is known that the above mentioned 12,000 square miles contains about nine billion tons of peat fuel. The Mines Branch state that seven bogs within shipping distance of Toronto are estimated to be capable of producing 26,000,000 tons of fuel and seven bogs in the vicinity of Montreal and Ottawa could provide 23,000,000 tons.

The present experimental work at Alfred is being carried on under the direction of the Peat Committee consisting of B. F. Haanel, M.E.I.C., Mines Branch, Ottawa; R. A. Ross, M.E.I.C., consulting engineer, Montreal; Arthur A. Cole, mining engineer of the T. & N. O. railway, and R. C. Harris, commissioner of works, Toronto. This committee is appointed by the Dominion and Ontario governments each of whom have granted $35,000 annually for the last three years to carry on the work.

Recent Visitors at Headquarters from out of town

E. P. Muntz, A.M.E.I.C., Toronto; T. A. MacLean, M.E.I.C., Greening, Quebec; Peter Gillespie, M.E.I.C., Toronto; H. C. Nourse, A.M.E.I.C., Sherbrooke, Quebec; J. H. Devery, A.M.E.I.C., Vancouver, British Columbia.

EMPLOYMENT BUREAU

AND MEMBERS' EXCHANGE

To make this department more valuable it is proposed that in future advertisements of situations vacant should state salary, and give details of requirements.

Situation Wanted

Civil Engineer

Civil engineer, M.E.I.C., 18 years experience in Canada in railway engineering. In charge location, construction and maintenance, also experienced in municipal works, etc. Scotchman, 39 years of age, desires position as contractor's superintendent and engineer or with railway in charge of engineering works. References on application. Apply Box No. 117-P.

Experienced Steel Plant Engineers

A number of engineers who have held responsible positions with a steel company in Canada are open for engagement. All are corporate members of *The Institute* and high class men. Address Box 122-P.

Civil Engineer

Graduate of University of Toronto 1921; one and a half years' experience on cost and sales statistics; four years on highway location and land surveys; overseas; desires position on production work or time-study work with pulp and paper company or other large industry in Canada. Apply Box No. 120-P.

Mechanical-Structural Engineer

Young graduate mechanical-structural engineer, age 26, married, good on organization and detail work, wants employment on live mechanical or structural work. Willing to work hard at reasonable wage to start, if good future is offered. Training includes experience and special study on power (steam, hydraulic, and electric), combustion, meter, and experimental engineering. Can report on short notice, detailed information as to education, experience, and references. Apply Box No. 113-P.

Construction Engineer

Graduate of McGill, 1916, with experience as draughtsman, designer, inspector, instrumentman, construction work and assistant engineer. Open for employment immediately. Apply Box No. 121-P.

Civil Engineer

Graduate of McGill, 1915, B.SC., A.M.E.I.C. At present in charge of maintenance of way and building department of a railway company. Would like to better his position. Speaks both French and English. Has had experience as assistant engineer for a municipality on road and sewer construction, on hydrographic survey as instrumentman and also in charge of party. Would consider any line of business with prospects of advancement. Apply Box No. 123-P.

Electrical Engineer

Graduate of McGill University, 1914, A.M.E.I.C., ten years' experience in construction, operation and maintenance. Age 30, married. At present assistant chief engineer for power company in the South, available now. Salary expected $250.00 per month. Apply Box No. 124-P.

Members' Exchange

Instruments for Sale

One Charles Hearn, theodolite, 2½-inch needle; one Andrews theodolite, 4-inch needle; one Troughton level, 13 inches long, also small pocket compass, tape and chain. Apply Box No. 26-A.

ELECTIONS AND TRANSFERS

At the meeting of Council held on October 24th, 1922, the following elections and transfers were effected:—

Members

HAVENS, Verne Leroy, Editor and Director, Ingenieria Internacional, tech. magazine in Spanish on civil, elec'l., mech. and mining engr'g., McGraw-Hill Co., 10th Avenue, New York City.

HOWE, Clarence Decatur, B.Sc. (Mass. Inst. of Technology), partner C. D. Howe and Company, consltg. engrs., Port Arthur, Ont.

Associate Members

BAILY, Paul, C.E., L.Sc., (Univ. of Ghent, Belgium), City Engineer, Verdun, Que.

CAMPION, William, asst. engr., Welland Ship Canal, St. Catharines, Ont.

FALKNER, John William, P.O. Box 118, Summerland, B.C.

GARDNER, Albert Charles, in chg. classification and location parties, hydrometic work, Canada Land and Irrigation Company, Medicine Hat, Alta.

HUNTER, William Howard, B.A.Sc. (Univ. of Toronto), res. engr., building new bridge piers for C.P.R. at Buckingham Junct., Que., for Foundation Company, Limited, Montreal, Que.

IRVINE, Frederick, combustion engr., Cleaton Company (Canada) Limited, Montreal, Que.

JENNINGS, Michael Wallace, B.Sc. (New Brunswick Univ.), asst. engr., C.N.R., Port Arthur, Ont.

PAINE, Arthur James Carman, B.Sc. (Arch.—McGill Univ.), in chg. of erection of addition to Sun Life Assurance Company's head office building, under direction of their architects, Darling & Pearson, Ottawa, Ont.

STALFORD, Victor Kennedy, private practice, consltg. and supervising elec'l. engr., Hamilton, Ont.

STEWART, Andrew Ernest, B.Sc. (C.E.—Univ. of Sask.), of Moose Jaw, Sask.

Juniors

CRABTREE, Henry Swift, dftsman. and designer, Dept. of Public Highways, Toronto, Ont.

WEATHERHEAD, Albert Victor, architect, concrete engr. and contractor, specializing in concrete constrn., Amherst, N.S.

Transferred from the class of Associate Member to that of Member

EASTON, Frank Stewart, B.Sc. (Eng.—Glasgow Univ.), ch. civil engr., re-constrn. track system and new constrn. and mtce. of rlys. and bldgs., etc., Mexico Tramways Company, Mexico Light and Power Company, and subsidiaries, Mexico City, under G. R. G. Conway, M.E.I.C., Managing Director, Mexico.

HEARNE, Alfred Robert James, engr. in chief, Han-Pu District, Chinese Govt., Tientsin Pukow Rly., Nanking, China.

MOORE, John MacKenzie, consulting engr. and architect, London, Ont.

VERNON, Bruce, C.E. (Univ. of Penna.), principal asst. engr., Montreal Tramways Company, Montreal, Que.

Transferred from the class of Junior to that of Associate Member

BEAUDOIN, Horace, chg. of design and supervisn. of constrn. of water wks., sewers, highway bridges, etc., with V. E. A. Bélanger, consltg. engr., Hawkesbury, Ont.

MANSBRIDGE, Alfred, engr. and dftsman., Trussed Concrete Steel Company, Walkerville, Ont.

OSLER, Charles Ernest, inspecting engr., G.T.Rly. System, Montreal, Que.

SNIDER, Arthur Melville, B.A.Sc. (Univ. of Toronto), of Sherbrooke, Que.

Transferred from the class of Student to that of Junior

GAGNON, Alban, C.E. (Ecole Polytechnique, Montreal), highway engr., Leger and Charlton, Limited, Lachine, Que.

WILSON, Hugh Allen, B.Sc. (McGill Univ.), in chg. of tests on mech. apparatus throughout plant, improvements on steam system, Canadian Salt Company, Limited, Windsor, Ont.

BRANCH NEWS

Toronto Branch

O. M. Falls, A.M.E.I.C., Secretary-Treasurer.

Opening Meeting

The opening meeting for the season of the Toronto Branch was held on October 12th, and a large number of the members were present to greet their Chairman elect, Wm. Storrie, M.E.I.C.

After thanking the Branch for his election as Chairman, Mr. Storrie outlined in a general way the activities planned for the coming season and intimated that after the New Year sectional meetings would be introduced; four of the ten meetings of the winter session being reserved for a municipal section. He referred briefly to the passage of the Professional Engineers Act at the last Session of the Legislature and strongly urged upon all engineers the maintenance of a high standard of professional ethics, the elimination of wire pulling and dishonorable methods in securing engineering appointments. In the latter part of his address Mr. Storrie dealt with the effect of municipal water purification and sewage treatment upon the health of the community. Some very interesting figures were quoted to show the decrease in typhoid mortality due to increase in municipal expenditure for water purification in Toronto and throughout the Province.

At the request of the chairman Prof. H. E. T. Haultain, M.E.I.C., R. O. Wynne-Roberts, M.E.I.C., and R. B. Wolsley, Secretary and Registrar, briefly addressed the meeting in the interests of the Provisional Council under the Professional Engineer's Act. They urged all engineers to register under the Act and by thus showing their approval thereby aid in securing necessary amendments to the Act. It was stated that there were approximately three thousand engineers in the Province eligible to register and that application forms and copies of the by-laws of the Association would be sent out by the secretary within the next two weeks.

The Chairman introduced to the meeting Prof. Ellis, A.M.E.I.C., of the Department of Metallurgy, University of Toronto, and expressed the desire that the Branch might be favoured with a paper by the Professor during the coming season.

After Mr. Storrie had called upon the various members of the executive present for a few remarks, sandwiches and coffee were served.

The Manufacture of Tin Plates

At the meeting of October 19th, S. R. Cound, Esq., General Manager of the Canadian Baldwins Steel Corporation Ltd., gave a very interesting informal talk on the manufacture of tin plates and plant operation. After tracing the general development of the tin plate industry from its inception in 1230, its introduction into Wales in 1660 up to the present time Mr. Cound referred briefly to foundation and other problems met with during the construction of their Toronto plant at Ashbridges Bay. Not the least interesting of these was the foundation to carry the drive wheel for the presses which, with its bearings, weighed approximately two hundred tons.

Mr. Cound described in details the various stages in the manufacture of black plate and white plate, including the heating, rolling, pickling, annealing, cold rolling and platting. The supremacy of Wales in the tin plate industry Mr. Cound attributed to the skill, enthusiasm and pride in their work exhibited by the various tradesmen employed. In no other part of the world were to be found tradesmen so apt in this industry as in Wales where generation after generation have wrought to perfect the manufacture of tin plate. Lantern slides very clearly illustrated the equipment and operation of the Toronto plant.

In the discussion which followed Professor Ellis, J. M. Oxley, M.E.I.C., W. J. Smithers, A.M.E.I.C., Prof. P. Gillespie, M.E.I.C., R. O. Wynne-Roberts, M.E.I.C., G. W. Winckler, M.E.I.C., and others spoke.

G. T. Clark, M.E.I.C., presided at the meeting owing to the fact that the Chairman, Mr. Storrie, was indisposed.

Chairman's Inaugural Address

Gentlemen:—

I need scarcely say that I appreciate the honour you have done me in electing me your chairman for the present year. With the hearty co-operation of all the members of the Branch your Executive hopes to make this winter's programme the best of a series of successful years. I hope the members will regularly attend the meetings and thus encourage the Executive to furnish you with the best possible speakers on subjects of practical value to the engineering profession.

The inaugural addresses delivered by my two immediate predecessors contain enough food for thought and practical suggestions regarding the engineer and his varied activities as to keep *The Engineering Institute of Canada* busy for many years to come in an effort to fulfill all that has been put forth. I sincerely hope the view points advocated in these addresses will be kept in mind and every effort made to secure the establishment of some of the many ideals indicated. I wish to refer first of all to certain matters that have a bearing on the winter's programme and *Institute* affairs in general, and then to deal shortly with that branch of engineering with which I have the privilege to be connected.

The Branch secretary, F. B. Goedike, A.M.E.I.C., has resigned his position on the Executive owing to his having accepted an appointment in Hamilton. The thanks of the Executive have been conveyed to Mr. Goedike for his eighteen months' efficient service as secretary. Acting under the Branch by-laws, the Executive has appointed O. M Falls, A.M.E.I.C., as secretary, and he has kindly consented to act.

The Executive has decided to hold ten meetings between now and Christmas and ten from the middle of January to the annual meeting on March 15th. Arrangements have been made to bring before the Branch speakers of outstanding ability who will deal particularly with the business side of engineering. Such subjects as municipal finance, the local improvement act, public speaking and the giving of expert evidence will be dealt with by men well qualified to speak on such matters. Evenings have been set apart for discussions on town planning, fees and policy, while the remaining evenings will be taken up by technical engineering subjects. An effort will be made to develop the social side as well as introducing a debate on some live topic.

In common with others, I believe the Toronto Branch is large enough in numbers to try out sectional meetings. With this object in view I intend asking your Executive to make a start with a "Municipal Section", giving this section full charge of four out of the ten meetings to be held after Christmas. I should like to see this given a fair trial and should your Executive decide to proceed with the formation of such a section I hope those members of the Branch who are interested will give it their hearty support.

As you are all aware, the Ontario Legislature finally passed what is known as "The Professional Engineers' Act, 1922". The Act as passed does not go as far as we should like and to many it is a disappointment that the Legislature modified the bill as submitted. However, it is a step in the right direction and, in the opinion of those best able to judge it, it is felt that the terms of the Act should be put

into force. Willis Chipman, M.E.I.C., in the June number of *The Engineering Journal* has very ably dealt with the situation as it existed after the passing of the Bill.

Since then the Provisional Council appointed under the Act has been busy getting things into shape and now await the approval of the Lieutenant-Governor in Council to the by-laws drawn up before registration can commence. R. B. Wolseley, the genial secretary of the Engineers' Club, has been appointed registrar and secretary-treasurer of the Association of Professional Engineers and almost any day now full particulars will be available for all to register under the Act. The headquarters of the association have been arranged in the Engineers' Club building. The registration fee is ten dollars and the annual fee has been fixed at five dollars. It is well to remember that the Association of Professional Engineers has a clearly defined objective, the registration and safeguarding of the interests of the engineer, and will not conflict in any way with *The Engineering Institute of Canada*. I am sure the Provisional Council appointed under the Act will have the hearty co-operation of the members of the Toronto Branch and that everything possible will be done to make the working out of the Act a success.

A decided step forward has been taken by the Council of *The Institute* in approving of the Committee on Policy's recommendation whereby each member of Council will have his expenses paid once a year to the Council meetings. In the past, non-resident councillors have rarely been able to attend the Council meetings in Montreal, as is clearly shown by the statement of attendances contained in the Committee on Policy's report. With the Toronto Branch having three councillors it will thus be possible by an arrangement amongst themselves whereby they will be present at different meetings and thus enable the Branch to keep in closer touch, through their representatives, with the Council at headquarters.

There is a growing feeling among engineers that a Code of Ethics should be drawn up. I very heartily agree with this and I am delighted to note that the Council of *The Institute* have appointed a committee to report on the proposed code recently published by a committe consisting of representatives from the American Society of Civil Engineers, the American Institute of Mining Engineers, the American Society of Mechanical Engineers, the American Institute of Electrical Engineers and the American Society of Heating and Ventilating Engineers. This Joint Committee's letter of explanation and the proposed code are given on page 511 of the October *Journal* and should be closely studied by the members of this Branch. I commend this report as being brief and to the point. The ten clauses of the Proposed Code of Ethics will bear repetition here.

> "That the dignity of their chosen profession may be maintained, it is the duty of all engineers to conduct themselves according to the principles of the following Code of Ethics:
>
> 1. The engineer will carry on his professional work in a spirit of fairness to employees and contractors, fidelity to clients and employers, loyalty to his country and devotion to high ideals of courtesy and personal honour.
> 2. He will refrain from associating himself with or allowing the use of his name by an enterprise of questionable character.
> 3. He will advertise only in a dignified manner being careful to avoid misleading statements.
> 4. He will regard as confidential any information obtained by him as to the business affairs and technical methods or processes of a client or employer.
> 5. He will inform a client or employer of any business connections, interests or affiliations which might influence his judgment or impair the disinterested quality of his services.
> 6. He will refrain from using any improper or questionable methods of soliciting professional work and will decline to pay or to accept commissions for securing such work.
> 7. He will accept compensation, financial or otherwise, for a particular service, from one source only, except with the full knowledge and consent of all interested parties.
> 8. He will not use unfair means to win professional advancement or to injure the chances of another engineer to secure and hold employment.
> 9. He will co-operate in upbuilding the Engineering Profession by exchanging general information and experience with his fellow engineers and students of engineering and also by contributing to work of engineering societies, schools of applied science and the technical press.
> 10. He will interest himself in the public welfare in behalf of which he will be ready to apply his special knowledge, skill and training for the use and benefit of mankind."

Now, gentlemen, I must of necessity strike an unhappy note. The fixing of fees, the creation of a code of ethics, the establishment of engineering policies and the securing of legislation will be of no avail if we fail in their practical application. We have a duty to perform to the public as well as the public having a duty to perform towards us. We must honestly and fearlessly show up and endeavour to stamp out everything in the profession that savors of wrong doing. Ability and reputation should be the means of securing our individual progress rather than the amount of wire-pulling and so-called influence that is so often brought to bear on the securing of appointments. I recently heard of a reeve stating at a Municipal Council meeting that he was disgusted with the tactics adopted to secure an engineering appointment by one engineering firm who had "parked on his doorstep" ever since the vacancy occurred. In another case to which my attention was drawn, the influence of contractors who had received contracts from a firm of engineers was widely used to secure a certain appointment. Under such circumstances, how could this firm be fair and just in their dealings with these contractors?

This form of securing the influence of contractors who have received contracts from engineers is a serious affair and one that should not be employed under any condition. I know of a case where one alderman absolutely committed himself to a contractor to vote for a certain engineering firm before he even knew who were being considered for the appointment, or before the committee investigating the status of the various engineers had brought in a recommendation. Needless to say, this contractor had in the past received several contracts from the engineering firm for whom he was working. In yet another case the manager of a contracting company approached one of his shareholders, asking him to do his utmost to have the rival firm withdraw its application in order to ensure the continuance of certain contracts that it had been accustomed to receive from the engineering firm they were anxious should secure the appointment. Apart from other considerations this means of securing certain work is an absolutely unfair situation in which to place any contractor and strenuous means should be taken to overcome such unprofessional conduct.

During the present year my firm has found it necessary on two occasions to issue flat denials regarding statements made by a firm of engineers about work carried out by ourselves. Statements were made by the opposing firm as to defective work done by us which they positively knew to be absolutely untrue. In each case ample proof was forthcoming and the statements were easily refuted. One can readily understand that if this state of affairs is allowed to continue considerable damage to the profession and loss of prestige will result. The sooner the public realize that when tactics like those I have just mentioned have to be adopted in order to secure work there must be something seriously wrong with the engineering ability of the firm that finds it necessary to adopt them, the better it will be for the engineers as a whole. If we wish to be seriously considered by the public as a profession, let us see to it that we adopt professional conduct in our business affairs. It is only my great respect for our profession and my jealous regard for what I consider the ideals for which it stands that induce me to make these somewhat personal remarks. As your chairman I feel I should not be doing my duty if I failed to bring this matter to your attention. The exposing of such tactics will, I believe, do more than anything else to cleanse the profession from such practices. Fortunately for the profession we have, as a whole, a fine body of men but that is all the greater reason for jealously guarding our interests and exposing the few who would seek to lower our ideals. Let us keep in mind the legend that appears on the cover of the *Journal:* **"To facilitate the acquirement and interchange of professional knowledge among its members, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."**

Gentlemen, we must purge the profession of that kind of work and set our own houses in order and above reproach before we can expect that recognition from the public to which we are justly entitled and before legislation, minimum fees or ethics can be of any avail. Let us jealously guard our ideals and show an ever increasing factor of moral safety and courage in our dealings with the public and our fellow engineers.

There is a growing tendency throughout Canada to recognize the ability of the Canadian engineer. Occasionally one finds a natural inclination existing to bring engineers from the United States when some big problem arises but we must impress our authorities with the necessity of seriously investigating the capabilities of the home product before going over the line. There is scarcely a field of engineering, that cannot be successfully undertaken by the Canadian engineer.

and in almost every case the home engineer starts out with a distinct advantage due to his knowledge of the climatic conditions. Take the question of sewage disposal, for instance, — the climatic conditions form a big factor and much knowledge is to be gained from local conditions. The Ontario Provincial Board of Health and the city of Toronto have carried out splendid research work in this field and the Canadian engineers who have closely followed this work are as capable as any of dealing with the disposal of sewage. Let me just point out that of all the systems of sewage disposal that have been invented, and that can be said to have operated with success, all but one have been invented within the Empire and even that one, (the Imhoff system), is an advance on the old Travis tank, a British product. Let us make certain that this increasing tendency to employ Canadian engineers is encouraged in every conceivable way, but chiefly by ensuring that the solution of such problems is placed in the hands of men capable and qualified to deal with them.

Let me now make a reference to "The Engineer and Public Health." Practically every piece of engineering has an effect on the health of the people. This effect is of a varied nature reaching its maximum in that branch of engineering dealing with water supply and sewage disposal and it is these two phases to which I propose to refer very shortly to-night. All New York State Board of Health bulletins have this statement prominently displayed: "Public health is purchasable; within natural limitations any community can determine its own death rate." This statement sums up to a nicety the situation on all public health matters. The life and death of the citizens is an economic problem depending almost entirely on two essentials, — education and expenditure of money. It has been well said that education respecting health matters is the light that will eventually lead us out of the unsanitary wilderness.

We hear a great deal these days about economy. It is the cry of the present day and there can be no doubt but that the financial situation of the country demands economy. War, industrial strife, and strikes are waste and everything possible should be done to stop this waste. However, this cry of economy opens up a possibility of great danger by delaying restoration, reconstruction and progress. Economy must be prevented from becoming merely a popular cry. It must be borne in mind that the mere stoppage of expenditure of money may not be economy but may result in real waste. It is not economy to refrain from the expenditure of money that will ensure to all the people an abundant supply of pure wholesome water, protected not only by the purification of the water but by the efficient treatment of the sewage. There is no expenditure of public funds that brings such excellent results as that spent on improving the health of the citizens. It can be most clearly shown, by considering some of the leading cities of Ontario, that there is a very close relation between the death rate and the amount of money spent by the public health department.

The case of the city of Toronto where the water supply is both filtered and chlorinated is particularly interesting as will be seen from the following year to year table respecting typhoid fever:

Year	Amount spent per head of population	Typhoid fever death rate per 100,000	Year	Amount spent per head of population	Typhoid fever death rate per 100,000
1905	\$0.24	17.2	1914	\$0.59	8.1
1906	0.24½	27.6	1915 (c)	0.64	1.9
1907	0.25	21 3	1916	0.67	6.9
1908	0.27	20.9	1917 (d)	0.83	3.8
1909	0.27¼	24.7	1918	0.90	3.1
1910 (a)	0.27¼	44.2	1919	1.25	2.6
1911	0.41	21.6	1920	1.72	2 3
1912 (b)	0 45	13.2	1921	1.58	3.1
1913	0.53	11.4			

(a) Chlorination starts.
(b) Slow sand filters start.
(c) Pasteurization of milk starts.
(d) Drifting sand filters start.

The cleaning up of the water supplies of the province of Ontario has been gradual and its effect is plainly shown in the following table relating to the typhoid death rate per hundred thousand of population in the different types of community in the province:

Year	Counties	Cities (excluding Toronto)	Toronto	Towns	Average for Province
1921	...	...	3.1	....	...
1920	6.2	5.5	2.3	25.0	7.0
1919	4.6	4.3	2.6	19.5	5.2
1918	5.1	9.6	3.1	17.2	7.5
1917	6.6	7.5	3.8	31.4	8.4
1916	8.1	12.1	6.9	52.2	12.5
1915	9.4	9.4	1.9	38.0	10.7
1914	10.0	12.4	8.1	47.4	13.5
1913	13.3	17.3	11.4	46.0	17.7
1912	10.9	27.7	13.2	47.0	18.7
1911	16.1	35.8	21.6	62.3	25.3
1910	22.0	51.5	44.2	56.4	31.5
1909	25.1	34.3	24.7	67.7	29.9
1908	20.5	37.8	20 9	107.1	29.7

It is interesting to note that in every case where cities have a much lower typhoid rate than towns, it is due unquestionably to the more complete control of the water and milk supplies and to a greater degree of completeness of the sewerage and sewage disposal systems. The table shows that so far as the towns are concerned they are considerably behind the cities in the typhoid death rate showing the necessity in the towns of having improved water and milk supplies.

The city of Toronto previous to 1910 took its water supply from lake Ontario without treatment of any kind. Following a mild typhoid epidemic in 1910, the raw water was chlorinated. In 1912 a slow sand water purification plant was put into use so that for that year the raw water was partly filtered and chlorinated. In 1917 the drifting sand water purification plant was put into operation while in 1915 the city passed a by-law enforcing the pasteurization of the milk supply. Toronto's typhoid mortality rate per hundred thousand of population during these years was as follows:

1910 — 44.2	1913 — 11.4	1916 — 6.9	1919 — 2.6
1911 — 21.6	1914 — 8.1	1917 — 3.8	1920 — 2.3
1912 — 13.2	1915 — 1.9	1918 — 3.1	1921 — 3.1

This has been accomplished notwithstanding the fact that during the last ten years the pollution of the raw water had increased enormously. Thus in 1910 before the water was treated in any way the typhoid mortality rate was 44.2 per hundred thousand of population while in 1921 the rate had decreased to 3.1 per hundred thousand, a very striking result due to a large extent to the efficiency of filtration and sterilization of the water supply. To put it in another way, — if the same typhoid death rate had taken place last year as occurred in 1910 there would have been approximately 220 deaths whereas there were only 16. The following table shows the death rate from typhoid fever compared with the expenditure of the public health departments:

Place	Year	Typhoid death rate per 100,000	Amount spent per head on public health
Province of Ontario....	1919	5.2	\$0.20
City of Toronto.......	1919	2.6	1.25
Cities other than Toronto...........	1919	5.6	0.70
Towns...............	1919	19.5	0.70

While the most effective work of the engineer in relation to public health has undoubtedly been connected with water supply and sewage disposal, other fields have contributed towards the betterment of the health of the community. I need only mention the great work done by irrigation and drainage in relation to malarial fever, particularly in reference to the work done on the Panama canal. There are other forms of engineering work that are rapidly coming to the front, particularly in reference to sanitation and industry. It has been clearly shown the tremendous effect of dust removal in the reduction of tuberculosis in certain classes of industry. The controlling of the air supply in industry by the conditioning of the moisture and

temperature have had wonderful effects in relation to fatigue and output of the workers. Better lighting systems have been introduced thus preventing many accidents due to bad lighting and fatigue. Wonderful progress has been made in general ventilation and with all these problems the engineer has been very closely connected.

I have endeavoured to show what this branch of engineering has been able to do for the health of the citizens particularly in this neighbourhood. It is unnecessary to dwell at any length on the part played by the engineer in securing this increasingly satisfactory state of affairs as to one and all it is self-evident that to a very large extent the engineering profession is responsible for arriving at the methods, the design, the construction and operation of the systems that have attained the desired results. The remuneration of an engineer for the carrying out of this work is of two kinds, — the actual monetary consideration received and the satisfaction which must accrue to him from the successful carrying out of any form of engineering work affecting the health of the citizens. The responsibility placed on the engineer is a heavy one and he must make absolutely sure of his ground before proceeding with the work. Most engineering is visible and any mistakes that may be made are open to the public view. In this respect we are unlike the medical profession where most of their mistakes are under ground.

It is only necessary to make a close study of the tables and statistics available to realize what tremendous advances have been made in sanitary engineering. In the city of Toronto we know beyond all doubt what improved water and milk supplies have done towards reducing typhoid fever. That can be definitely ascertained from the figures available but that does not end the effectiveness arising out of these improved conditions. There is no doubt whatever but that the general health of the whole community is benefited but the precise amount of benefit derived cannot be ascertained from the statistics.

While such great improvements have taken place particularly in the sciences of water supply and sewage disposal I firmly believe that we have yet a great deal to learn particularly in reference to sewage disposal. A study of the history of water purification indicates improved conditions being arrived at step by step so that now a filthy, dangerous water may be made clear, sparkling and sterile in fifteen minutes; and while greater advances have been made in the purification of water than in the satisfactory disposal of sewage there still remains a wide field for research work in connection without water supplies.

A much more difficult problem is the satisfactory disposal of sewage and particularly of the sewage sludge and I believe we are on the verge of great developments along these lines. The satisfactory disposal of sewage in most communities is essential if for no other reason than the protection of other municipal water supplies. The unsatisfactory nature of many sewage disposal plants erected in the past has frequently developed into a nuisance as well as a source of pollution of water supplies. While large expenditures in the past have taken place in protecting our water supplies, many municipalities in this province are faced with heavy expenditures on sewage disposal. During the last ten years a great deal of research and experimental work in sewage disposal has been carried on. There still remains the problem of the satisfactory disposal of sludge to be solved but there is every indication that this is in a fair way towards solution. While the present generation is busily engaged cleaning up the water supplies and sewage disposal I believe the chief sanitary problem for the coming generation to solve will be connected with the purification of the air. With a tremendous hydro-electric development in this part of the world this is unlikely to be such a burning question, but where many municipalities are dependent largely on coal as their source of power then this matter becomes urgent and every effort towards its solution will very materially react on the health of the community. The increased use of electric power will go a long way towards improving the purity of the atmosphere.

Gentlemen, there is probably no country in this world to-day with the outlook for prosperity that Canada has. We have simply nibbled at the fringe of her great natural resources. There remains undiscovered untold wealth throughout the length and breadth of this Dominion. Ours is indeed a goodly heritage and our lot has been cast in pleasant places.

To the engineering profession will be entrusted the development of these vast natural resources for the benefit of our fellow citizens. Let us fully realize our opportunities and responsibilities and prove worthy of our noble calling.

Saskatchewan Branch

D. A. R. McCannel, A.M.E.I.C., Secretary-Treasurer.

On October 4th, a special meeting of the Branch was held in the City Hall Council Chamber at which Col. H. C. Boyden gave a paper, (illustrated), on "Highway Investigations and Specifications". Though it was a rainy night there was a large attendance including several visitors.

On October 9th, a meeting of the Saskatoon members and engineering students was held at the University of Saskatchewan in Saskatoon, at which R. N. Blackburn, M.E.I.C., Regina, read a paper on "Waters of Saskatchewan for Boiler Purposes".

On October 12th, the first regular Fall meeting of the Branch was held at the Kitchener hotel preceded by a dinner. Following the dinner it was proposed that each member present tell a humorous story. This brought a wonderful collection of yarns most of which were so old that some of them almost got by for new ones — which was "going some". The business of the meeting was then proceeded with. There was a progress report from the Legislation Committee, with a promise of a full report at an early date. The action of Council in regard to payment of the expenses of Councillors to one Montreal meeting a year was received with approval. M. B. Weeks, M.E.I.C., reported on the Western Canada Irrigation Association convention held at Maple Creek, Saskatchewan and Brooks, Alberta. He gave some interesting information as to what crops could and could not be grown successfully on irrigated land. The convention passed a resolution asking the Alberta and Saskatchewan universities to provide courses in irrigation engineering. Mr. Weeks' report was followed by an address by Lieut. Col. A. J. McPherson, A.M.E.I.C., entitled "Some Notes on Irrigation". He gave statistics showing the effect of irrigation on various crops and outlined the various methods of putting the water on the land. Lieut. Col. Garner, M.E.I.C., in discussing the paper gave great praise to the C.P.R., for developing irrigation schemes in Alberta and British Columbia. R. N. Blackburn, M.E.I.C., who presided at the meeting in the absence of the chairman, gave some information on the results of experiments in intensive farming in England. Several other members took part in the discussion.

Ottawa Branch

F. C. C. Lynch, Associate E.I.C., Secretary-Treasurer.

J. S. Kingston, A.M.E.I.C., of the Department of Public Works addressed a general meeting of the Central Ward Municipal Association on the evening of October 3rd, his subject being the fuel situation. The address was decidedly constructive and contained suggestions which impressed the gathering as being quite feasible. Following a general discussion strong recommendations were made in favour of central heating plants and the use of coke ovens.

The city of Ottawa building by-law committee resumed its activities recently. A portion of the proposed revised by-laws will soon be ready to be submitted to the

city council. Members of the committee present at the meeting were:—Ald. T. H. Brewer, chairman; Controller John Cameron; J. Albert Ewart, A.M.E.I.C.; George Crain; H. Newlands; R. Henham, A.M.E.I.C.; and A. F. Macallum, M.E.I.C., commissioner of works.

The Mines Department is issuing a publication entitled "Structural Materials along the St. Lawrence River between Prescott and Lachine, Quebec", by L. H. Cole, B.Sc., M.E.I.C., and Jos. Keele, B.Sc. Copies of this publication are obtainable upon application to the Director, Mines Branch, Department of Mines, Ottawa.

Prof. Cooke of Princeton University will address the Ottawa Branch at a popular public lecture to be held about the end of November or early in December. The subject of his address will be "Recent Development in Aerial Plane Surveying".

Hon. J. E. O. Preuss, governor of the state of Minnesota will address the Ottawa Branch at a luncheon to be held on November 15th, the subject being "The Great Lakes — St. Lawrence Scheme".

Arrangements are being made for a meeting at an early date for the purpose of discussing "Canada's Fuel Problem".

The Ottawa Branch is arranging for an evening meeting to be devoted to a discussion on the various branches of surveying.

J. Grove Smith, B.A., B.Sc., A.R.C.S., F.R.S.A., Dominion fire commissioner, was the guest of honour at a luncheon held on October 12th, at the Chateau Laurier by the Ottawa Branch of *The Engineering Institute of Canada.* K. M. Cameron, M.E.I.C., presided, and with him at the head table were Fire Chief Robt. Burnett; Capt. R. J. Durley, M.E.I.C., secretary, Canadian Engineering Standards Association; A. F. Macallum, M.E.I.C., city commissioner of works; R. F. Uniacke, M.E.I.C., chief engineer, Penitentiaries Branch, Department of Justice; G. A. Mountain, M.E.I.C., chief engineer, Board of Railway Commissioners; H. P. Hill, M.L.A.; J. B. Hunter, Deputy Minister, Department of Public Works; A. H. Laurent, M.E.I.C., chief engineer, Department of Public Works; J. McLeish, Director of Mines Branch; Noel J. Ogilvie, M.E.I.C., superintendent of Geodetic Survey of Canada; A. A. Dion, M.E.I.C., general manager, Ottawa Electric and Gas Company. About ninety members of the Branch sat down to lunch and afterwards listened to a very eloquent address delivered by Mr. Smith.

Before introducing the guest of honour, Mr. Cameron referred to the splendid work done by Mr. H. P. Hill in supporting the efforts of *The Institute* in their endeavour to introduce legislation to improve the status of the engineering profession.

The Automatic Control of Fire

The subject chosen by the Dominion fire commissioner was "The Automatic Control of Fire". Handled by an ordinary speaker the subject would have proved interesting; but delivered by a scholar of Mr. Smith's ability and with his command of the English language, it became engrossing and at times thrilling. His natural gift as a speaker, combined with his very intimate knowledge of the subject, served to bring into relief a fact that is too often ignored, namely, that in the Civil Service of Canada, which so often comes under slighting criticism, there are some officials who for zeal and downright efficiency would be shining lights in any country in the world. He eulogized the work of *The Engineering Institute* and similar associations. One of their chief claims to credit was the fact that they drew professional men out of their shells and brought them face to face with the fact that there are other men with similar thoughts and ambitions, influenced by the same amount of technical knowledge as their own, with whom they come into immediate contact in their daily routine. In referring to the recent disastrous fire in Northern Ontario, he could not help wondering whether Providence had anything to do with the fact that it took place during fire-prevention week.

"We are the most prodigal and wasteful nation on earth," he said. "From childhood we learn to boast of our forest wealth, of our mines and of our vast natural resources. This tends to make us careless in our methods of taping the source of wealth and results too often in uneconomic development. We have not done what we ought to have done in the way of maintaining those wonderful resources handed down to us as an heritage. Nature may replace the wooded slopes denuded by fire, but it cannot rebuild burned cities nor restore lives sacrificed. Moreover, in rebuilding these cities and in repairing the ravages of the demon fire, energy is wasted that could better be employed in constructive rather than reconstructive labour. The fire losses annually in the Dominion reach an appalling figure. In 1921, apart from forest fires, a direct loss of $45,500,000 occurred in property alone. Indirect losses called for the payment by insurance companies of $65,000,000. The department of waterworks expended $24,000,000 in dealing with fire. A total expenditure was incurred of $130,000,000. The destruction of property thus caused an expense of $5.25 per capita, a sum which is at least ten times greater than in any other country except the United States. As a result of this, insurance rates are 5 or 10 times as great as in other countries," Mr. Smith said.

More serious still is the loss of life, which in Canada yearly amounts to between 300 and 450 lives. Sixty per cent of these deaths occur in homes, through gross negligence, but many in institutions and public buildings. The lecturer stated that one schoolhouse is burned every week of the year and one institution, such as a hospital or infirmary, every two weeks. The destruction of North Cobalt and Haileybury and other towns in the recent fire, was due to the fact that the structures were inflammable. For years the department had petitioned the provincial government that towns should be built and planned in order to minimize the danger from fire. A central area should be defined inside which the buildings should be of concrete and steel; that this area should be increased as the city grew and that water mains of adequate size should be laid. Frequently in large cities 4-inch and 6-inch mains would be found which are not capable of feeding even one fair sized fire engine.

The speaker was sorry to say that in other countries, more effective steps were taken to keep down loss of property and life from fire. Laws were rigidly enacted. The fault did not lie in there being no laws, but in the slip shod way in which the existing laws were, or rather were not, enforced. An amusing contrast in this respect

was cited by the lecturer, in the case of London, Ontario. The building by-law of that city occupied a volume of 350 pages, mostly containing technical directions, whereas the city of Birmingham, England, found 15 pages sufficient, and London, England, devoted but a few clauses thereto. In Canada there is great difficulty in enforcing laws that have not public opinion strongly behind them. On the statutes there were hundreds of regulations regarding fire that were never enforced. Consequently the work of the department had to be conducted along educational lines. The object was to demonstrate clearly the efficiency as well as the real need of the precautions they suggested, the means to be adopted of safeguarding life and property and the laws necessary to compel the people to use them. Then the public will say, "We want this law and these regulations," and immediately ensues control. It is, of course, the duty of all citizens to take every precaution against fires and like disasters, but unfortunately duty is not popular with many mere mortals.

Mr. Smith concluded his most interesting address by an eloquent interpretation of every engineer's duty and every citizen's duty to himself, to his city, to his province and to his country. From the point of view of the saving of dollars and cents, from the more serious standpoint of the duty of saving precious lives, adequate protection must be ensured against fire. The most efficient method of securing this end was the development of the community conscience, the city conscience, the determination to think not for oneself, but also for one's fellowmen. "This accomplished, the ideal existence will ensue, when all men's good shall be the moving impulse of each one of us," he concluded amid applause.

Mr. Cameron thanked Mr. Smith on behalf of the members of *The Engineering Institute* for his very interesting and enlightening address.

Following the lecture a series of slides of the cold storage building at Montreal harbour were shown on the screen as illustrating a good fire-proof building. The precautions taken in rendering this building safe from fire were so good that the insurance rate thereon was the lowest in Canada — 2¼ cents per $100. As the value insured is $6,000,000 it can readily be seen what a tremendous saving a low rate achieves.

After these slides, a moving picture was shown which illustrated very lucidly the need in factories for perfect fire quenching devices and the efficiency of the sprinkler system in extinguishing fires before any damage was done. Figures quoted on the screen showed plainly the tremendous outlay yearly on fire engines and devices for pumping water onto and into buildings, and the ineffectiveness of all these measures. In buildings where the sprinkler system has been installed, out of 27,000 fires in the last 13 years, 93 per cent were extinguished with the breaking of one head, and the percentage of efficiency was approximately 98. Moreover, the cost of installation and of maintenance was small — infinitesimal when compared to the property and life saved. The sprinkler heads are broken within a few seconds of the outbreak of fire and an immediate alarm is automatically sounded. In the old method of fighting fire, several minutes elapsed between the start of the fire and action. With this invention action is almost simultaneous with the outbreak of fire. These few minutes mean the saving of thousands of dollars and many lives.

London Branch

F. Jas. Bridges, A.M.E.I.C., Secretary.

R. I. Olmsted, A.M.E.I.C., Branch News Editor.

The first fall meeting of the London Branch was held Saturday, October 7th. The meeting was in the form of an inspection tour in the afternoon, five points of engineering interest in the city being visited, followed by a dinner and a business meeting. In spite of a steady down pour of rain, there was a good attendance to reward the efforts of H. A. Brazier, M.E.I.C., city engineer, and E. V. Buchanan, M.E.I.C., general manager of the Public Utilities Commission of London, who conducted the party, and at each place described the points of interest, and answered questions. The members and visitors were transported in automobiles of different members of the Branch. The members present were: Messrs. Brazier, Buchanan, Angus, Morgan, Bridges, Forbes-Mitchell, Laniel, Miller, Olmsted, Rostron, Talbot, Veitch, Fuller, Madgett, Eckert. The non-members present were: A. O. Hunt and S. W. Peart of the Public Utilities Commission, J. Wallace, engineer for Watt and Blackwell, architects, J. A. Sinclair, W. E. Stephens and H. S. Philips of the city engineer's office, Hamilton.

The party left the city engineer's office at 2.30 p.m., and went first to the city paving plant. This was erected in the spring of 1921. F. D. Cummer and Sons Company constructing the drying and mixing units, Norman McLeod Ltd., the erection of the buildings, the remainder of the work being done by day labour. The total cost of this work was $50,000. The special feature of this plant is the semi-underground asphaltic cement storage tank constructed of super cement, with a capacity of 120 tons and equipped with continuous steam coils for heating. The actual average output of this plant for 1921 was 1,980 square yards in nine hours, over a total of 128,000 square yards.

The East End disposal works was next visited. These works, which were designed for a population of 60,000, were erected in 1914, and consist of three sedimentation tanks, two dosing chambers, two filter beds, two humus tanks and sludge drying beds. The daily flow at present varies from 360,000 to 800,000 gallons per twenty-four hours. The sedimentation tanks are of the two story non-reversible type with a velocity of flow approximately one-quarter of a foot per minute, giving an average of two hours detention. The sludge capacity of each tank is eighty cubic yards. Each filter is 160 feet long by 40 feet wide with sixty-four fixed sprays in each. The average discharge of each nozzle is about nine gallons per minute. The entire filter beds and dosing chamber are housed in a reinforced concrete building. The humus tanks are 21½ feet internal diameter, with a total depth of 25 feet, having a capacity of twenty-five thousand gallons sewage and thirty-six cubic yards sludge. The sludge beds are each 50 feet by 65 feet.

The party was then driven over to the garbage incinerator plant. This incinerator was erected in 1912

by Messrs. Laurie and Lamb, at a cost of $39,750. It is of the Heenan and Froude high temperature type having three cells each about thirty square feet effective grate area. The capacity of this plant is fifty tons of garbage and refuse per twenty-four hours and does not require any fuel with the exception of starting. The gases from the furnace pass through a combustion chamber where a temperature of 1,500 to 2,000 deg. F. is maintained. The steam generated together with that from two 150-h.p., boilers, is used for heating Victoria hospital which adjoins the incinerator.

The combined electrical distributing station and artesian wells pumping plant at the corner of Ridout and Horton streets was next visited. The party inspected the transformers and switchboard for the lighting and power systems, the 600-volt rotary converters for the local street railway system, and the 1,500-volt rotary converters for the London and Port Stanley Railway. Housed in the same building are the electrically driven air compressors for raising part of the city's water supply from wells, and also the electrically driven turbine pumps which discharge the water that is raised from the wells into the city mains. Adjoining the station is a million gallon covered concrete reservoir, and also the iron removal plant which consists of an areator constructed on the top of a settling basin which feeds the areated water by gravity through six pressure filters into the million gallon reservoir.

The last place inspected was the Douglas Avenue pumping station. This was designed to take care of 8,000,000 gallons per twenty-four hours being the anticipated maximum flow from London West and the low lying districts along the banks of the river. The equipment consists of four 8-inch horizontal centrifugal Aurora pumps each directly connected to a 35-h.p., Crocker Wheeler motor, each pump having a capacity of 1,350 Imperial gallons per minute against a maximum head of 50 feet. The motors are operated automatically by floats and are protected from sudden stoppages. A simplex Venturi meter is installed on the 20-inch discharge main, which crosses under the river to the main outfall syphon chamber. The general contractors for this station were John Hayman and Sons, Limited, their contract price being $32,460., exclusive of pumps and electrical equipment.

By this time all members of the party had developed hearty appetites so they drove to the DeLuxe café. It was 7.45 p.m., before the appetites of all were satisfied, the party then going to the board room of the Public Utilities Commission. The business meeting then opened with H. A. Brazier, chairman of the Branch in the chair. As there was no business arising from the minutes of the previous meeting, these were adopted as read. Following the reading of the minutes of the last executive committee meeting, much discussion took place. The Association of Professional Engineers of the Province of Ontario was discussed after the secretary gave what information he had from correspondence regarding the matter. Plans were threshed out regarding speakers for future meetings, the result being that programmes were arranged for the next two meetings.

The chairman then welcomed to the Branch the following members present, who had joined the Branch since the last meeting; Robt. Angus M.E.I.C., of the C. S. Hyman Company, A. Hedley Morgan, M.E.I.C., engineer and plant manager of E. Leonard and Sons, C. J. Madgett, A.M.E.I.C., manager of the London Bridge Works, and R. J. Fuller, A.M.E.I.C. local representative of the John V. Gray Construction Company. The letter from Headquarters re mileage to Councillors was presented by the secretary. After discussion, a motion for the Branch to go on record as being in complete accord with the matter was put before the meeting and it was unanimously carried. The secretary also reported on the request of Dr. J. D. Barnett, M.E.I.C., honorary chairman of the Branch, that he be allowed to retire from his office, due to his being unable to be of any active use to the Branch. By unanimous vote of the members, the secretary was requested to write Dr. Barnett and express their wish that he retain his office. H. A. Brazier and E. V. Buchanan had prepared papers on the various points visited during the afternoon, but owing to the length of time required for the foregoing discussions, and the lateness of hour, it was proposed to have the papers presented at an extra meeting to be held October 18th. This was unanimously carried and the meeting adjourned.

Calgary Branch

J. A. Spreckley, A.M.E.I.C., Secretary.
Floyd K. Beach, A.M.E.I.C., Branch News Editor.

Owing to the absence in the field of a large proportion of the membership during the summer months, the Branch has had a recess from meetings. This recess was broken on October 9th, by a very largely attended meeting which was addressed by Lieut. Col. H. C. Boyden, representing the Portland Cement Association, who spoke on "Concrete Highway Investigations and Specifications".

The prairie provinces have as yet been unable to gc in for concrete highways. In this comparatively new country we feel that we are doing well to make less expensive road work serve until the volume of populatior will warrant greater expenditures. It was, consequently with some surprise that the greater proportion of the Branch heard from Col. Boyden figures covering the very startling growth in mileage of concrete roads in the United States and in eastern Canada. His statemen that the yardage laid in 1921 exceeded by 10 per cen all yardage laid prior to 1916, and that 1922 yardag bids fair to exceed that of 1921, was enough to call fo very careful attention from all present to the entir talk. Some lantern slides were shown illustrating method in operation for testing various types of pavement, an various devices used to increase the life of pavement.

Discussion of the paper was rather short owing t the early departure of the speaker's train. G. W. Craig M.E.I.C., occupied the chair in the absence of P. J. Jen nings, M.E.I.C., chairman of the Branch, and G. P. F Boese, A.M.E.I.C., acted as secretary in the absence o J. A. Spreckley, A.M.E.I.C.

After Col. Boyden's departure, G. W. Craig gave very interesting account of the Winnipeg meeting. H touched on the whole programme lightly and made speci mention of several features of special interest to Calgar engineers. The visit to the new Great Falls power projec

brought out the daring of the men who financed the great project, as well as the foresight and ability of the engineers who conceived it and carried the details through to a completed plant. Mr. Craig forecasted that in the not distant future Calgary will require more power than is at present available, and she will need cheap power, and reference was made to a recent pronounced by R. A. Brown before the Calgary Rotary Club in this connection. Another feature of the Winnipeg meeting that was of importance to Calgary members was the paper of Prof. Thorvaldson, on the deterioration of concrete in alkali soil. Mr. Craig recommended careful reading of the paper which has appeared in the September issue of *The Engineering Journal*.

The arrangement of a programme of meetings for the coming winter has been undertaken by a programme committee of which R. W. Craig is convenor. A very interesting programme has been planned, and it is hoped that meetings may be arranged once in two weeks. An expression of opinion favoured Monday night for meeting instead of Friday night as formerly. F. K. Beach, A.M.E.I.C., is secretary of the programme committee.

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

The Moncton Branch held its first post summer meeting Thursday evening in the Barker house, where an enjoyable banquet was served after which W. C. McMullen of the Department of Lands and Mines for New Brunswick gave a very fine address, which was greatly enjoyed by all those present.

The address dealt with mines and minerals of the province, in which he said that the mineral wealth of New Brunswick in 1921 was placed at $1,874,000 divided as follows: Petroleum, $29,000; grindstones, $57,000; clay, $66,000; stone, $97,000; natural gas, $139,000; lime, $203,000; gypsum, $360,000 and coal $920,000. Grindstones he said were being quarried at Stonehaven, Gloucester county, but lime production in contrast to the other minerals was diminishing. Mr. McMullen quoted Dr. Bailey who had said that in New Brunswick there are many occurrences of minerals, the rocks being of various formations, most of them mineral bearing, but the covering of the soil made discovery difficult. As yet, with the exception of coal, gypsum, shale, most of the more valuable minerals in New Brunswick had been discovered in pockets only. This would not mean that they did not exist, and it was the speaker's hope that as population increased, even though the covering of the soil now made discovery difficult, valuable minerals would eventually be found.

In the first place, the speaker treated of gold. This mineral had not been found in paying quantities, and there has been little to raise the hope that it ever would.

Copper occurs in many places in Charlotte county mainland and islands, and elsewhere along the Bay of Fundy coast. Some deposits were quite rich, but the quantity was very small. Iron and copper occur along the Salisbury and Harvey railway. Some copper ore is found near Woodstock. A great deal was expected from the Dorchester copper mine where much money was spent, but the mine was closed up. At Annandale on the Kings-Queens county line, near Chipman, the Dick Brothers, have a copper mine, producing very good samples, and from this a profitable shipment was made during the war.

Hematite, (red iron ore), was extensively mined in the "forties", near Woodstock, and smelted with charcoal. The mine has long been closed and its reopening is very doubtful. The iron at Lepreau was found to be scarce, but there is a very large deposit of iron ore near Bathurst. The Drummond Company spent about a million dollars on it, and worked it for a year, shipping 80,000 tons of ore to the U.S.A. Coal was not handy for smelting, the owning company went into liquidation, and no work has been done since. It may be reworked.

Manganese, now apparently worked out, was once abundant at Markhamville, Kings county. It occurred in rock form and as bog manganese. The Markhamville works have long been closed. Some manganese was shipped during the war from Hordan mountain. During the last years of the war, bog manganese was worked at Adamsville and Dawson Settlement. That at Adamsville was surveyed by the Dominion government and reported on favourably. It was sixty-nine per cent water, nineteen per cent peat, five per cent iron and seven per cent manganese. These deposits, however, were small and are now exhausted.

Silver and galena ores are too poor to be profitably worked.

New Brunswick peat, like that of the rest of Canada, is so difficult to dry that it has not as yet been worked at a profit. Experiments were being made by the Dominion government elsewhere in Canada, and the results of these might make our peat deposits valuable.

Some years ago Tungsten was found in northern York county, near the southwest Miramichi. The ore was well defined, 150 feet about 3 feet wide being exposed, and an outcrop 650 feet distant. It assayed about one per cent, and is not now worked.

Moncton is too near the gypsum quarries of Hillsboro to need an extended description of them. There were alabaster, pink gypsum and certain lower grades in Albert county. Along with it was some anhydrate gypsum worthless for plaster. The Hillsboro gypsum industry was a stable and important one. The Tobique gypsum is of a low grade. It had been used as a fertilizer, but was not now worked at all.

A marl deposit was recently opened in southern Victoria county, where there is considerable depth of it, but nothing has yet come of it.

Infusorial earth is found at the bottoms of ponds, at Pollet lake, near the Kings-Albert line south of the Canadian National Railway; near Land's End, Kings county, and near St. John. It is used in refining sugar, as a polisher, as a filler for explosives, etc. It consists of minute shells, white when pure. The deposits have not been developed.

Graphite has been found a little south of Norton, and has been mined a little near St. John, but was too impure to be profitable.

Coal is mined in the Minto district. In the best mines there — those of the Minto Coal Company, and

Welton's — where the seam is eighteen to thirty-six inches thick, the coal is profitably mined. The Minto coal area is estimated at 112 square miles, and the Minto Coal Company have about thirty-six inches without a "bone" between the layers, and quite near the surface. They have exhausted their southern area, where they did all the work by hand, and are now working the northern mines by cutting machinery driven by electric power. Steam shovels are used in some of the mines to strip ten or twenty feet of earth off the coal. Where the coal is deeper, shaft mining is used. Some mines failed, because coal was under 100 feet of hard rock and the mining cost too much.

The Beersville coal mines are closed, being too far off the main line and the seams too thin.

Albert shale occurs in a large zone of Kings, Albert and Westmoreland. As Scotch shales has been reduced with considerable success, it was hoped that similar success would follow here. Certain New Brunswick oil shales are really very rich. If they could be found of uniform consistency and could be reduced economically, operations might be carried on with success. Thus far the reduction has not been profitable. A great deal of money has been spent lately in testing these shales. The Rosevale experimental station gets 37½ gallons of oil to the ton from some shale by using a Wallace retort. In the fissures of the Albert shales a small amount of Albertite is found, which has a very large oil content. This was once mined in Albert county, but not for many years past. It produced about 100 gallons of oil to the ton and was also used along with regular coal to increase the amount of gas produced from the latter.

Antimony was mined at Lake George, York county, as early as 1876, a large amount of ore having been taken out. It was later closed down but about four years ago it reopened and again closed. A new company has it now in hand. There is a considerable amount of ore there, consisting of stibnite with some native antimony, but reduction of the ore is difficult. The Lake George ore is about sixty-nine per cent antimony, twenty-eight per cent sulphur and eight per cent iron.

In closing, the speaker discussed many of the mining laws of the province and was of the opinion that the provincial mining laws taken without any changes from Nova Scotia, where mining was very highly developed, was a mistake in that a "search right", costing $20, gives the right to search for eighteen months, over an area two by two and one-half miles, without damage to the surface owner. If the searcher finds anything, he may then secure a "working right" over one square mile, which costs $50 per year for two years, and $25 for third year. He may then secure a lease for twenty years, renewable twice, at $50 per square mile.

He believed the law here weak in allowing any person to sell his search right and in that the searcher is not required to know there are minerals in his area before he secured his permit. In the western provinces a man must find something before he is given a 40 acre claim. In New Brunswick holders of license to search, and to work, and of twenty-year leases, may combine their claims and preempt a large territory much of which they may not be developing. However the uncertainty of New Brunswick mineral veins is an argument in favour of large areas, as illustrated by the Minto Coal Company which, when its southern areas ran out had the northern area to fall back upon. Mr. McMullen also quoted from Dr. Bailey that the surface owner should have greater priority rights.

A vote of thanks to the speaker, moved by A. S. Gunn, A.M.E.I.C., seconded by J. R. Freeman, M.E.I.C., was tendered by the acting chairman, C. S. G. Rogers. A.M.E.I.C.

Guests of honour were Magistrate C. A. Steeves, Dr. Henderson, the speaker of the evening, and representatives of the press.

At the close of Mr. McMullen's speech, vocal solos were rendered by Mrs. Harold Price, and Mr. Desire Bourque, and a piano solo by Major McKee, who accompanied both vocal numbers.

Peterborough Branch

R. C. Flitton, A.M.E.I.C., Secretary.

The first meeting of the Fall season was held on October 12th, and was addressed by George Hogarth M.E.I.C., chief engineer of the Department of Highways of the province of Ontario. The subject of the paper "The Progress of Highway Construction in Ontario" was presented in a very entertaining manner and illustrated by moving pictures and lantern views.

Mr. Hogarth emphasized the importance of our highways and explained the benefits, direct and indirect which accrued from the construction of good roads He described the work which formed the programme of the department for this year giving startling figures showing the progress which had been made during the present season. He explained how it was necessary to plan far ahead so that adequate supplies of material would be available close to the work in order that progress would be uninterrupted. He described much of the modern equipment that is necessary for efficient road making, stating that this equipment was being inproved almost from day to day. A number of excellent slides were shown depicting the high class of permanent structures which were being erected by the department Some stress was laid on the question of safety and also on beautification, and some interesting contrasts were shown of existing roads which had been made safer for traffic and at the same time more pleasing to the eye The dust nuisance was another feature which Mr. Hogarth discussed, and he said much experimenting had been done to arrive at the best cure for this trouble.

The meeting was well attended and Mr. Hogarth's instructive and interesting paper was much appreciated by the members of the Peterborough Branch.

Vancouver Branch

P. H. Buchan, A.M.E.I.C., Secretary-Treasurer.

Inspection of Sumas Reclamation Project.

The Vancouver Branch had the pleasure of accepting the invitation of the Hon. E. D. Barrow, Minister of the British Columbia Department of Agriculture, to visit the Sumas reclamation project, on Saturday, September 23rd

Owing to the uncertainty of the weather, and the necessity of devoting the whole day to the trip, the attendance of members was not as large as the executive committee hoped for, but those who did join the expedition had a real treat, which will not be easily forgotten.

A special train left the British Columbia Electric Railway's, Carroll street terminal at 8.30 a.m., with about twenty members. At New Westminster they were joined by the Hon. E. D. Barrow and F. W. Anderson, M.L.A., A.M.E.I.C., who accompanied the party to Chilliwack, arriving there at 11.10 a.m. The town clock was found to be running on standard time, which gave an extra hour to fill in before lunch. This, however, was most agreeably spent by the more active members of the party in a leisurely stroll about the town and surrounding neighbourhood, made the more delightful by the charm of the warm sunshine and beautiful scenery. When the lunch finally arrived, everyone was in good spirits and furnished with a healthy appetite, which did ample justice to the fare at the Empress hotel.

At 2.00 p.m., the party was taken in automobiles, provided by the Department of Agriculture, to a point at the junction of the Sumas river and the new channel of the Vedder, distant about thirty minutes ride. They then embarked in launches, and proceeded to inspect the new dyked channel of the Vedder for a mile or two in the southerly direction, the extent of this undertaking causing no little surprise in the minds of the visitors. After a short walk along the top of the western dyke, the party re-embarked in the launches, and were taken back to the junction with the Sumas river, where they turned west, and proceeded up the river to the site of the dam and proposed pumping plant. An interesting feature at the above mentioned junction was the barricade of nets across the Sumas river, to prevent the salmon from running up the Sumas into Sumas lake, where their valuable spawn would be lost to the salmon industry.

The party, which was under the guidance of F. N. Sinclair, A.M.E.I.C., engineer-in-charge of the project, was then conducted over the site of the dam, and afterwards given a short lecture on the general features of the undertaking, amplified by an inspection of the places and a large map of the area included in the project. A great many questions were asked, which Mr. Sinclair and his staff answered very patiently.

At 4.45 p.m. supper was served at the camp, the excellence of which far surpassed the capacity of even the most willing guests. Immediately upon the conclusion of the meal, the party commenced the return trip to Chilliwack, but not before three hearty cheers were given for the hosts, who certainly earned the gratitude of the Branch by their kindness.

The party boarded the B. C. Electric special at 6.15 p.m., which was waiting at the station, and made a fast trip home. During the journey, the chairman of the Branch, C. Brakenridge, M.E.I.C., tendered the thanks of the party to the Hon. E. D. Barrow, for the very enjoyable outing and the splendid facilities provided for inspecting the reclamation scheme to the fullest advantage. Mr. Barrow in his reply, expressed his appreciation of this opportunity to demonstrate the extent and potentialities of the undertaking to the engineering profession of British Columbia, and his very great personal pleasure in the interest which the members of the party had displayed throughout the visit.

In brief, the general problem involved in the scheme is to drain Sumas lake and surrounding low areas of rich, arable land, comprising in total about 30,000 acres, and thereafter prevent this land from being inundated during the freshet periods on the Fraser and Vedder rivers. The high water on the Fraser, which is the most formidable feature of the problem, occurs in May and June, and is due to the melting snows in the mountains of the interior. The water backs up the Vedder and Sumas rivers, which normally are insignificant streams, into Sumas lake, usually inundating the surrounding country to a depth of several feet. The freshets on the Vedder occur in November, as a rule, and are due to heavy rains in the neighbouring mountains. The stream swells to many times its normal size, and becomes a swift flowing torrent, causing serious damage to dykes by erosion. In order to immunize the latter danger, the Vedder has been diverted into a new artificial channel through the low-lying areas. The lake area will be drained by a network system of ditches to a point at the proposed dam on the Sumas river. During low-water periods on the Fraser river, the normal flow into the lake will be discharged through a spillway into the Sumas river, but during flood conditions, the spill-way will be closed, and the drainage from the lake area pumped into the Sumas river, by a very powerful electric-driven pumping plant at the dam.

Complimentary Dinner to Arthur St. Laurent, M.E.I.C.

An informal dinner was given by the Executive Committee of the Vancouver Branch and the Council of the Association of Professional Engineers of British Columbia, at the University Club, on Wednesday, September 13th, at 6.30 p.m., in honour of Arthur St. Laurent, M.E.I.C., chief engineer of the Department of Public Works, Ottawa. Notwithstanding the somewhat hurried arrangements, necessitated by short notice, the occasion proved most enjoyable, much of the success being due to the skill and genial personality of Wm. Smaill, M.E.I.C., who discharged the double duties of chairman and host.

Mr. St. Laurent visited Vancouver in company with the Hon. Dr. J. H. King, Minister of Public Works. during his recent tour of British Columbia in respect of the affairs of his department. This fact was commented upon, as being quite apart from the customary procedure of Ministers of Public Works, their habit in the past being to omit the chief engineer from the personnel of their parties on such tours of inspection. The policy of Dr. King, in this particular, commended itself to those present at the dinner, as being a thoroughly business-like and common-sense practice, demonstrating the Minister's clear understanding of the relationship of the engineer to the works under his professional supervision, and adding new dignity to the office of chief engineer of the Department.

In acknowledgement of the complimentary remarks of the chairman and a number of the other gentlemen present, Mr. St. Laurent expressed his keen pleasure in having this opportunity of meeting brother engineers in

British Columbia at such an informal and enjoyable gathering and assured him that any who visited Ottawa would be very warmly welcomed at his department. He also said that it would give him very great pleasure to take the greetings of the Vancouver Branch, extended by Branch Chairman, C. Brakenridge, M.E.I.C., to the Ottawa Branch of *The Institute*.

The dinner was attended by the following gentlemen: Wm. Smaill, M.E.I.C., Vancouver, Arthur St. Laurent, M.E.I.C., Ottawa, C. Brakenridge, M.E.I.C., Vancouver, D. O. Lewis, M.E.I.C., Vancouver, A. C. Eddy, M.E.I.C., Vancouver, A. E. Foreman, M.E.I.C., Vancouver, E. G. Matheson, M.E.I.C., Vancouver, W. G. Swan, M.E.I.C., Vancouver, J. A. Dawson, Vancouver, P. H. Buchan, A.M.E.I.C., Vancouver, P. Philip, M.E.I.C., Victoria, E. E. Brydone-Jack, M.E.I.C., Victoria, C. C. Worsfold, M.E.I.C., New Westminster, E. H. Verner, Port Coquitlam, A. D. Swan, M.E.I.C., Montreal.

Second Narrows Bridge

During July last, it was brought to the notice of the Executive Committee of the Vancouver Branch, that public approval was being sought by the Burrard Inlet Tunnel and Bridge Company of a contract with the McClintock. Marshall Construction Company, of Pittsburg, Pa., for a bridge across the Second Narrows. There being some doubt as to whether the services of a qualified independent engineer had been retained by the Burrard Inlet Tunnel and Bridge Company, it was deemed advisable, by the Executive Committee of the Branch, to appoint a special committee to investigate this question in the interests of the public.

The special committee's deliberations resulted in the drafting of a questionnaire, to be forwarded to the Burrard Inlet Bridge and Tunnel Company, which was amended and approved by the Executive Committee on Monday, July 31st. This was duly forwarded to the secretary of the said company, who replied to the letter on August 3rd. Shortly afterwards, it was announced by the company that A. D. Swan, M.E.I.C., had been appointed as consulting engineer, thus rendering further functioning of the committee unnecessary.

Town Planning

During September, an active committee on town planning was formed, consisting of two representatives from each of the councils of Vancouver, North Vancouver, New Westminster, Point Grey, South Vancouver and Burnaby; also two delegates each from the Vancouver Board of Trade, Vancouver Real Estate Exchange, *The Engineering Institute of Canada*, the Architectural Institute of B. C. and the Trades and Labour Council. The delegates from the E.I.C. were C. Brakenridge, M.E.I.C., and W. B. Young, A.M.E.I.C., the chairman of the committee being alderman T. H. Tracy, M.E.I.C., of the Vancouver city council.

The immediate purpose of the committee was to draft a proposed Town Planning Act, modelled on the suggestions of Professor T. H. Adams, received a year ago and closely following the Saskatchewan Act. This matter was placed in the hands of a sub-committee, with C. Brakenridge as chairman, to draw up and handle the details of the proposed Act, all technical members of the general committee lending active assistance to obtain a well-considered measure for submission to the provincia government at the next session of the legislature.

The efforts of this committee were rewarded by the proposed Act receiving the endorsation of the Union o British Columbia municipalities at its annual conventio held in Kamloops recently. Some opposition has develop ed, however, from the city of Vancouver's legal depart ment, which holds the opinion that the proposed Act wil cause considerable confliction with existing legislation a embodied in the Land Registry Act, the Municipal Ac and the Vancouver Incorporation Act. Notwithstandin this, it is confidently hoped that really serviceable an comprehensive legislation will be secured to enable th municipalities to avoid many of the pit-falls which occu through the present hap-haggard methods of dealing wit the town planning problems arising in this rapidly grow ing province.

Niagara Peninsula Branch

R. W. Downie, A.M.E.I.C., Secretary-Treasurer.

The Niagara Peninsula Branch opened its season b a dinner at the Welland House, St. Catharines, on Frida October 20th, 1922, at 7.15 p.m., which was participate in by about forty members and friends. After a sho sing-song, the guest and speaker of the evening, Cap T. S. Scott, city engineer of Niagara Falls, Ontario, rea a most interesting paper on "Roads".

The subject was opened by Jeffrey Farnol's intro duction to the "Broad Highway", afterwards Mr. Sco touched on the historical side, showing that the wid spread use of roads, as we know them, is comparativel modern, the macadam road being developed with th coming of the stage coach. The advent of railwa delayed further advance in the science of road constru tion, until the arrival of the automobile, which has ma road construction an entirely different problem to wh it formerly was. Mr. Scott then mentioned vario materials used for surfacing, and stated that no resear work worth mentioning, on the subject had been do and it was badly needed; also that none of the colleg had taken up the science of road construction until ju lately.

A hearty vote of thanks, proposed by A. J. Gra and seconded by W. P. Near, was unanimously extend to the speaker by F. S. Lazier, chairman, who stat that the paper was the ideal they had been looking f popular and not entirely technical.

Cape Breton Branch

Kenneth G. Cameron, A.M.E.I.C., Secretary-Treasure

A regular monthly meeting of the Branch was h on October 10th, at the Branch rooms in Sydney, wh a paper on "Present day practice in concrete constructio by K. G. Cameron, B.Sc., A.M.E.I.C., and S. C. Miffl B.Sc., A.M.E.I.C., was read by Mr. Cameron. The atte ance was unusually large, a number of interested visit being present.

The writers stated explicitly that their paper de with the construction side of the concrete problem, rat than the design, and that no attempt had been made

nclude any original matter, but that the paper was prepared as a brief summary of the latest information on the subject, all available sources of information being consulted as far as possible. The primary object of this paper was to promote greater confidence in the use of concrete, by showing the precautions necessary in the selection and use of the raw materials in order to obtain the best quality of finished product. The subject was taken up under four heads; raw materials, working stresses, inspection and construction. In dealing with the question of fine aggregate, stress was laid on mechanical analysis, and the impossibility of correct visual judgment was illustrated by means of actual samples, separated by standard sieves, and recombined in varying proportions. Under working stresses the matter of foundation loading was considered, and the writers remarked on the frequent unwillingness of employers to make the small expenditures necessary for preliminary survey work, and the handicap which is often thereby placed upon the designer, who generally has to take the blame for subsequent failures or exceeded estimates.

In making a plea for better quality of concrete work the writers said:—"The point to realize is that no amount of care in designing will avail unless every precaution is taken in construction. It is up to the engineer, — he spends his life studying how it should be done, — and it is up to him to see that it is done the right way. His own reputation, and by reflection, that of the profession, will grow or disappear accordingly. In every case the public exercises its judgment in selecting its professional man, but having selected him, it has to have confidence in him, and take his advice. When an engineer is consulted or employed to direct engineering work, his advice should be final. This applies particularly to concrete work, — for as one of the most abundant and commonly used of building materials, the general public has an idea that there is really nothing to it, — we know that there is really a great deal to it, and it is up to us to show the public that concrete is worthy of as much respect as any other material, and that their money will be more wisely spent if they seek and take the advice of the men whose business it is to know about it."

At the conclusion of the paper, considerable discussion took place, during which the results of different experiences were exchanged. A vote of thanks was tendered to the authors of the paper, and after which the meeting was adjourned.

OTHER SOCIETIES NEWS

Report of Representative, Calvin W. Rice, at the International Engineering Congress

Rio de Janeiro, Brazil, September 16, 1922.

The Engineers Club of Rio de Janeiro enjoys a position of influence quite beyond that of any engineering body in the United States. The President, Conde de Frontin, is an engineer of great distinction who has rendered service to his country in crisis and is also politically powerful. (He also has a box in the grand tier at the opera.) The Club owns its own building, of imposing architecture, on the principal street, Avenida Rio Branca, on the corner of Rua de 7 Setembro. It was the only organization in all Brazil to present an address to the Secretary of State, Hon. Charles E. Hughes.

Your representative was most fortunate in having been able to secure passage on the S.S. Pan America and in turn to have several pleasant interviews with Mr. Hughes and acquaint him with the engineer's program. The other representatives on the steamer from the societies were Col. Marshall W. Brown, member American Society of Civil Engineers and Dr. T. T. Read, member A.I.M.E. At the Captain's dinner, Sunday evening, before coming into port, your representative was requested by the passengers to preside to express the great appreciation of all to Captain Rose for his most excellent service and passage and to introduce the Secretary of State of the United States.

Owing to the lateness of the undertaking of the Congress and the arrival only to-day of papers from the United States, the program of the sessions has not yet been developed. On account of the incompleteness also of the Exposition itself, however, the really extensive collection of films of all manner of industries are destined to prove of great value to the people at large in connection with the Centennial Celebration owing to the lack of exhibits. Thus the very object of the Engineering bodies has been obtained, namely, of rendering a definite service within their own field. This is true throughout life that every person and every organization has right at his door the opportunity to render peculiar and effective service.

(*Signed*) CALVIN W. RICE.

Canadian Institute of Chemistry

The Council meeting of the Canadian Institute of Chemistry, was held on September 20th, at the headquarters of *The Engineering Institute of Canada*, in Montreal. At this meeting it was definitely decided to work out an organization on a professional basis. Already there is established the Maritime branch including three eastern provinces, and also a branch at Kingston, Ontario. It is further proposed to hold immediately, organization meetings in Montreal, Ottawa, Toronto and Kingston. In addition to this the Institute is negotiating with the Manitoba Chemical Society and it is anticipated that in the near future western branches may be established. Already the membership, including the leading chemists in these provinces, is at present two hundred and seventy-seven.

Steps have already been taken to create a class of Local Members, thereby satisfying the requirements of individuals who could not qualify in an academic way. These adherents will have no general vote in the affairs of The Institute and will pay a nominal sum to the local branch. The Institute is also undertaking to represent Canada in the International Chemical Union, and in this way Canadian chemists of prominence are being appointed on an international committee of research.

The legislation committee is preparing a model Bill for the use of chemists in any province where it may be desirable to seek legislation.

American Society for Testing Materials

The 1922 edition of the A.S.T.M. Tentative Standards, which has been published annually, has recently been issued. This volume contains:—steel, wrought and cast iron, (18); non-ferrous metals, (13); cement, lime, gypsum and clay products, (27); preservative coatings, (15); petroleum products and lubricants, (13); road materials, (35); coal and coke, (4); waterproofing, (9); insulating materials, (5); shipping containers, (4); rubber products, (12); textile materials, (4); miscellaneous, (4).

By way of explanation it may be said that the term "tentative standard" as distinguished from "standard" is applied to a proposed standard which is printed for one or more years with a view of eliciting criticism, of which the committee concerned will take due cognizance before recommending final action toward the adoption of such tentative standards by formal action of the society.

The society is prepared to supply copies of this volume upon request at a cost of seven dollars per volume in paper binding, and eight dollars per volume in cloth binding.

American Association of Engineers

Reciprocity in the Practice of Professional Engineer

The Council of State Boards of Engineering Examiners representing sixteen states in conference, on October 2nd and 3rd, at the Congress hotel, Chicago, agreed upon rules for the reciprocal registration of professional engineers. These rules provide that an engineer registered in one state may be permitted to practise in other states which are parties to the reciprocal registration agreement. The articles of agreement as prepared will become operative as soon as signed by the various boards.

Reciprocal registration with Canada and Mexico was provided for in the appointment of an investigating committee. Since the present time engineers going into Canada cannot practice unless registered in Canada.

Toronto Engineer Alumni Re-Union

The fourth annual re-union of the Engineering Alumni Association of the University of Toronto was held on Friday and Saturday, October 27th and 28th. The program consisted of class re-unions, dinner dance, attendance at football game, faculty reception, and re-union dinner along with private social entertainment, such as motoring, golfing, etc.

Class luncheons were held at noon on Friday by the respective years, at such locations as Hart House, Engineers', University and other local clubs, and by the numbers in attendance the change of this event from Saturday to Friday noon, seems to have been a very wise suggestion on the part of the Organizing Committee. The dinner dance which was well attended, was held in the Crystal Ball Room of the King Edward hotel on Friday evening at 7.00 p.m., and was a brilliant affair. On Saturday morning the annual meeting of the alumni was held in the Chemistry and Mining building, when general business relating to the Engineering Alumni, University of Toronto, was transacted. A buffet luncheon at 12.30 p.m., immediately followed the annual meeting. This was a get-together time for all School graduates to renew acquaintances. Out-of-town members of the alumni were the guests of the Toronto representatives.

Queens-Varsity football game was attended in a body by some three hundred members of the engineering alumni. A novel burlesque intermission performance was staged during the game by the engineering undergraduates of the Faculty of Applied Science. At 4.30 p.m., a very pleasant faculty reception was held in the thermo' building, where the wives and friends of all the alumni visitors spent a social hour together.

The big event — the annual dinner, — was held at 7.30 p.m., in the large hall immediately adjoining Convocation building, and was a huge success. Dr. A. C. Humphreys of the Stevens Institute of Technology, Hoboken, N.J., was the chief speaker of the evening, replying to the toast, "The Engineering Profession" proposed by A. V. Trimble, '04, chairman of the Organizing Committee of the Engineering Alumni Association. T. Arthur Baker, professional entertainer of New York, lead the singing and entertained the audience during the entire dinner. The undergraduates of the Faculty of Applied Science staged a very interesting programme in amateur boxing and fencing bouts, along with vocal selections.

The general expression heard on all sides during the dinner proved that these re-unions are now being looked forward to by all graduates of the Faculty of Applied Science, as an annual event.

Through the generosity of the Board of Directors of the Engineers' Club of Toronto, all out-of-town members of the alumni had the privilege of the use of the club during the two days' re-union. The privilege was greatly appreciated and the club rooms acted as a general rendezvous for "Toike-Oike" men from all parts of Canada.

E. DEVILLE, LL.D., D.L.S., F.R.S.C., Hon. M.E.I.C.

Preliminary Notice

of Applications for Admission and for Transfer

19th October 1922.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in November, 1922.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option, Railway, Municipal, Hydraulic, Mechanical, Mining or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects: Geography, History (that of Canada in particular), Arithmetic, Geometry, Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

Every candidate for election as ASSOCIATE shall be one who by his pursuits scientific acquirements or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

> **The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.**

ADAMS—ANDREW HEPBURN SYME, of 26 Balsam Avenue, Toronto, Ont. Born at Hamilton, Scotland, Sept. 28th, 1883; Educ., B.Sc. (Eng.) '13 and M.A., Glasgow Univ., Scotland; 1911-13, surveying, levelling, constrn. of roads and streets, preparing surveys and plans under A. V. Wilson, B.Sc., A.M.I.C.E.; 1912-13, calculating stresses, aiding in compiling steel handbook, Redpath Brown & Co., Glasgow; 1914 (summer), inspector, sewers and sidewalks (constrn.), St. Lambert, Que.; 1915-16, teacher of applied mechanics and strength of materials, Central Tech. School, Toronto; 1916-19, O.C. "B" Coy., 2nd Battn. Can. Rly. Troops, in chg. constrn. light and standard gauge rlys., over Ypres-Paschendael, Bapaume-Cambrai and Peronne fronts; Nov. 1918, resumed position in Central Tech. School, Toronto to date.

Relay Protection for Radial Transmission and Distribution Systems

A New Principle of Protection developed for the 50,000-volt 30-cycle Transmission System of the Shawinigan Water and Power Company.

P. Ackerman, A.M.E.I.C.,

Electrical Engineer, Shawinigan Water and Power Company.

Paper read before the Montreal Branch, The Engineering Institute of Canada, November 16th, 1922.

The customary practice of protecting a radial distributing system is to provide excess current relays with selective time adjustments. This principle of protection is based on the assumption that under any short circuit condition the current in the faulty line will exceed the normal load current. This excess current is used to actuate a current relay, which in turn trips the line circuit breaker, thus disconnecting the faulty line. Systems with several substations in series have a time delay feature on the current relays of the various stations. This time delay is made shortest on distant feeders and is gradually increased toward the power house and reaches the highest time setting at the power house. Such system of time settings will give distant feeders a chance to clear on trouble ahead of main feeders closer to the power house, even if the short circuit current should be sufficient to start to actuate the excess current relays of the main feeders.

Thus, the present principle employed makes use of the excess current in the line to indicate the abnormal condition of a short circuit, whereas selectiveness of tripping is obtained by time delay difference on relays of switches located in series to each other between the point of fault and the generating station. This principle of protection is found to be entirely inadequate for transmission systems where the whole generating capacity is fed out over a few long lines, as will be discussed hereafter.

The purpose of this paper is to point out the weaknesses of the excess current principle and to describe a new principle of protection which overcomes the objectionable features of the present excess current principle. The new principle makes use of the fact that a short circuit does not only manifest itself by excess current but also by low voltage. This fact is made use of so as to obtain a selectiveness of switches located in series, not only by time selective setting, but by a relay which will respond only if the relay is located close enough to the point of short circuit, so that the voltage at that point is so low as to offset the relation between voltage and current sufficiently to actuate the relay. This will be more clearly understood from the description given later in the paper.

The development of this new principle was forced upon the writer by the fact that the system under consideration had particularly pronounced characteristics, which made the application of the excess current protection hopeless. The paper will give a graphic description of the observations which lead to the realization of the inadequacy of excess current protection. It will show how sustained short circuit currents may drop near or below normal load current so that overload relays of settings in excess of normal load current become useless.

The 30-Cycle Shawinigan System and its Characteristic Features

Figure No. 1 shows a schematic single-wire diagram of the 30-cycle transmission system. The system is one of the oldest existing, transmitting power at 50,000 volts. The power is generated at Shawinigan Falls as 2,200-volt, 2-phase current. It is stepped up, at the power house, to 50,000-volt, 3-phase current, and as such is transmitted over 150,000 c.m., aluminum lines.

The system is particularly characteristic by the comparatively large load of 25,000 kw., being transmitted over a distance of 110 miles with the small size conductor

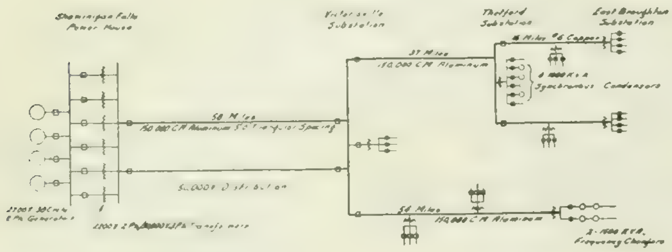

Fig 1 Schematic Diagram of 30 Cycle System

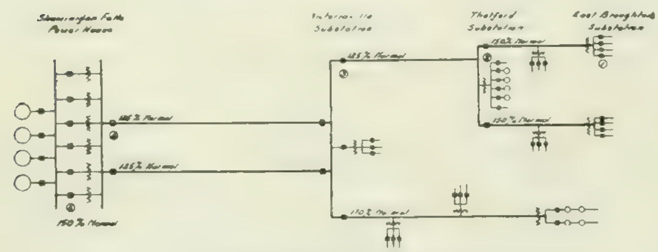

Fig 2 Diagram of 30 Cycle System.
Showing Current Settings of Excess Current Protection used on Various Lines Expressed in % of Normal Maximum Load Current

Figures Nos. 1 and 2.

and the comparatively low transmission voltage, the voltage drop under normal load being nearly 30 per cent. These features are particularly responsible for the rather limited short circuit current in case of distant short circuits.

The generator capacity is liable to vary between 12,000 kv.a., and 35,000 kv.a., depending on load conditions, so that during light load conditions line shorts may be limited as to current magnitude on account of limited generator capacity. Two parallel transmission lines are feeding Victoriaville. If ever one of these lines is taken out of service, the total reactance between Shawinigan Falls and Victoriaville doubles and as a result causes a further limiting of the short circuit current in case of short circuits beyond Victoriaville. From the above can be seen that this system has several features which tend to limit the short circuit current.

History Leading to the Development of the New Protection

Toward the end of 1918 a careful investigation was started on the system in question in an endeavour to improve the relay protective system. Up to that time ordinary bellow type overload relays were employed with varied success. The result of the investigation led to the decision of equipping the main system with a time selective excess current protection, consisting of modern inverse definite time relays of great accuracy and reliability.

Time Selective Excess Current Protection

The serious short circuit current limitation in case of distant line shorts and under certain operating conditions was then already realized, but no effective means were then known to assure the same protection for all operating conditions. As a result a protection was developed which would offer fair effectiveness during heavy load conditions. In our endeavour to improve the ordinary time selective protection a combination of time limit and instantaneous relays was provided on each line. One set of relays consisted of the customary inverse definite time relays, set so as to be time selective with switches in series. The other set consisted of instantaneous excess current relays of such high current setting that they would only respond to short circuits very close to their respective station.

This combination protection assured quick clearance in case of most serious shorts. Such rapid clearance was essential in order to limit the damage at the point of fault and also to limit the seriousness of the disturbance, particularly in view of the sensitive synchronous load of the system. The combination protection also permitted shorter time settings, which was particularly essential in order to obtain at least some effectiveness from the excess current protection. The settings were governed by the following considerations:—

(a) The current setting of each time limit excess current relay must be in excess of the maximum load current of the respective line. This is necessary so as prevent normal load current to actuate the relays. Figure No. 2 shows the current settings of the relays of the various line switches in relation to the normal load current of the respective line. Ordinary practice considers a current setting of at least 1.5 to 2 times normal, as minimum permisseble current setting to avoid wrong tripping on account of mementary overload. Figure No. 2 indicates that most lines were provided with a current setting of less than 1.5 times normal load current. These low current settings were somewhat dangerous but it was realized that they were essential, if at least some good should result from the protection due to the limited short circuit current to be expected.

(b) The time curves of the various relays were adjusted in such a way that under maximum short circuit condition, under which two switches had to function time selective, the switch closer toward the

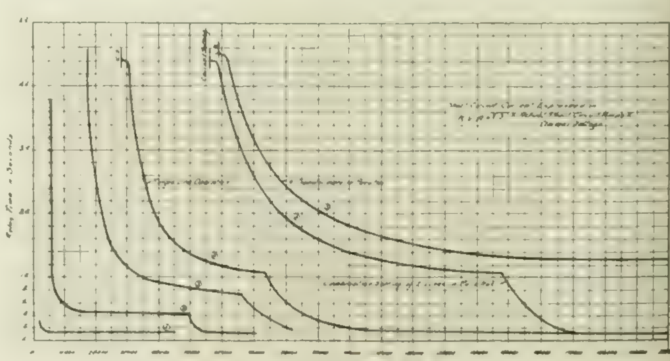

Fig 3 Time Curves of Excess Current Protection

Fig 4 Sustained Short Circuit Currents Under Most Limited Conditions.

Figures Nos. 3 and 4.

power house was given about 4/10th of a second additional time lag. Such time difference is necessary to allow a switch to rupture the current before the next switch toward the power house may be released by the relay protection. With the combination protection of inverse time setting for limited shorts and instantaneous settings for heavy shorts, the critical condition for time selective action exists always under a short circuit condition, which reaches a current value of the magnitude of the current setting of the instantaneous excess current relay.

This may be more clearly understood from an example. Figure No. 3 shows the time curves adopted for the various switches. The distant 2,200-volt local distribution feeders (1), (see figure No. 2), were equipped with instantaneous excess current relays. The line switch (2) had to be set time selective with switches (1) up to any maximum short circuit current value which might be created by a short circuit beyond switches (1). It was calculated that such shorts would never exceed 45,000 kv.a., due to the limiting effect from the transformer reactance. Short circuits on the 50,000-volt side of this line, however, could exceed the value considerably. Switch (2) was, therefore, equipped with an inverse definite time relay having sufficient time lag up to shorts of 50,000 kv.a., to allow feeder switches (1) to clear ahead of the main line switch (2). In addition to this time limit protection, switch (2) was equipped with instantaneous relays of 50,000 kv.a., to effect a quick clearance of 50,000-volt line shorts. Thus time curve (2) was obtained for switch (2). Switch (3) in turn had to be time selective with switch (2). In this case the most critical point of the two time curves is the point where the instantaneous relay of switch (2) starts. Time curve for switch (3) had to be chosen so that at that point sufficient time difference existed to allow switch (2) to clear a trouble on its own line before the relays of switch (3) would close contacts. Switch (3) was also equipped with an instantaneous protection for heavy short circuits close to its station, similar to switch (2). The time curve for switches (4) was determined in a similar manner as stated for switch (3).

Finally, transformer switches (5) had to be made time selective with line switches (4). In this case, however, the time curve had to be made time selective with respect to the combination setting of the two lines (4) operated in parallel. Time curve for generator switch (6) was found to become so high that this protection was considered useless and was never installed.

The system of protection and settings, as shown in figure No. 3, was installed early in the spring of 1919. In addition to this time selective excess current protection, a double line protection and ground protection in conjunction with a ground selector were installed. These protective features are similar to those described in a previous paper published in April, 1921, issue of the *Engineering Journal.* These features are, therefore, not further discussed in this paper.

Operating Results of the Time Selective Excess Current Protection

The performance of the protection was carefully watched during the summer months of 1919. A considerable improvement could be noticed compared with previous conditions. It was, however, soon noticed that the protection was unable to function properly in case of distant line shorts. In several instances it happened that a trouble at the Thetford end which should have been cleared by switch (3), did clear very slowly or not at all and as result the short had to be cleared by the power house operator pulling line switches (4), thus causing a total interruption.

Upon closer investigation, it was noticed that this condition was particularly pronounced whenever one line only was in service between Shawinigan Falls and Victoriaville. Suspicion arose then that, apparently under the above operating condition, the sustained short circuit current dropped below the current settings of the relay, and that it was for this reason that the relay was unable to clear the short circuited line.

To verify this, a short circuit test was arranged, as per operating diagram, figure No. 5. Three generators with four step-up transformers were feeding over one

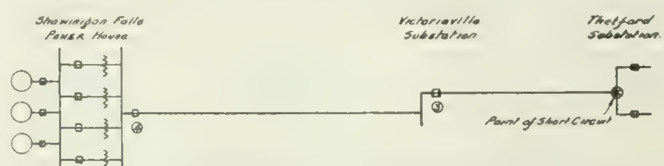

Fig 5. Operating Condition During Short Circuit Test which Proved the Inadequacy of the Excess Current Principle.

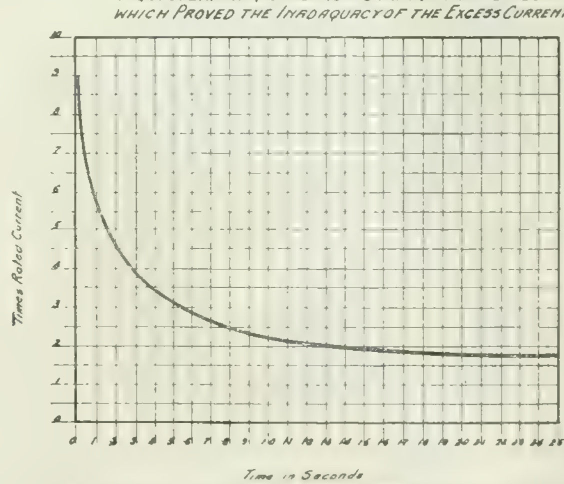

Fig 6 Typical Curve of Transient Short Circuit Current on 3 Phase Generator Subjected to 3 Phase Short Circuit

Figures Nos. 5 and 6.

line to Victoriaville into the Thetford line. A short circuit was thrown on to the system at Thetford and the relays of switch (3) were watched. The inverse definite time relay of the induction type started to move on the initial short circuit current kick, which indicated that the initial current rush was in excess of the current setting of 1.25 times normal load current. Before the relay disc reached the trip position, its movement became slower and slower and finally stopped completely. This was an indication that the short circuit current had dropped to the relay setting equal to 1.25 times normal load current. Finally, the relay disc started to move backwards, returning to its original dead position which

indicated that the final sustained short circuit current had dropped even below the tripping value of the relay; in fact from some other observations it could be noticed that the ultimate sustained short circuit had dropped even slightly below normal load current. All this happened within an interval of about two seconds.

The explanation of this apparently strange behaviour is to be sought partly in the high reactance of the lines and partly in the short circuit characteristics of generators in general. A dead short circuit at the terminals of a generator will cause a momentary current flow in the generator of up to 10 times normal load current or more. This short circuit current will, however, within one and one-half to two seconds, gradually drop to 1.5 to 2.5 times normal load current or less, depending on the characteristics of the generator. Figure No. 6 shows a typical curve of the gradual decrease of the short circuit current of a generator. This gradual decrease of the generator short circuit current from a high initial value to an ultimate low, or so-called sustained, value explains the behaviour of the relay in our short circuit test.

The test demonstrated clearly that the sustained short circuit current on the line under the given conditions dropped below normal load current. It was, therefore, clear that for such condition the principle of excess current protection was utterly inadequate, since no such excess current relay could naturally be given a setting low enough to be effective in case of shorts and still not operate under normal load conditions.

From the operating experience of the summer season, 1919, it had also been realized that it was very unsatisfactory to have a protection which would only offer a fair effectiveness under maximum generator and load condition, whereas under light load or abnormal operating conditions, the protection would be inoperative.

Figure No. 4 shows how particularly inadequate the excess current protection is with respective to light load conditions and with distant line short circuits. The sustained short circuit current values are shown for minimum condition of two generators and one line feeding to the extreme end of the system. The current values are the sustained values which would be created with short circuits at the extreme end of the respective lines. Comparing these values with the current settings of the respective line switches, it will be noticed that these values are all below the current setting of the respective line switches, with the exception of short circuit (2) cleared by switch (2).

From the foregoing it became evident that a new principle of protection had to be adopted before effective protection could be obtained for this system.

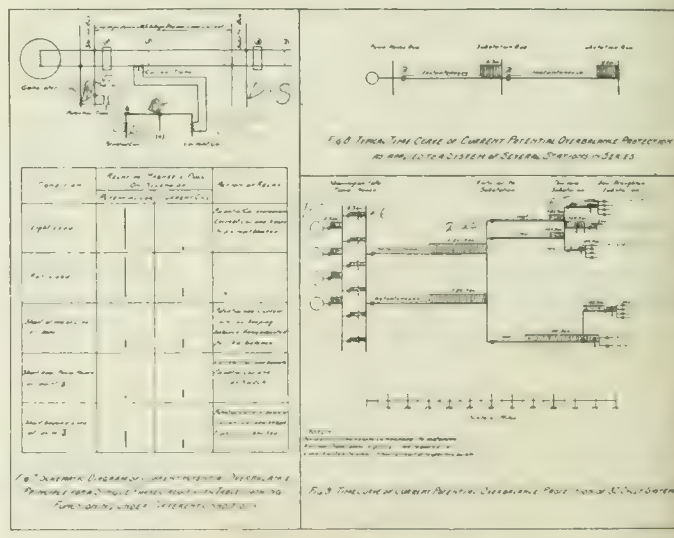
Current Potential Overbalance Protection

In the search for a new principle it was instantly realized that a new scheme had to take advantage of the fact that under short circuit conditions low voltage existed. Normal voltage had to keep the current relay blocked, even if its setting were below normal load current, so that it would not operate under any circumstances on normal load current, unless a short circuit existed at same time, pulling down the voltage.

An attempt was made first to develop a combination protection, consisting of current relays and low voltage relays. The complications and the difficulty of effective settings, however, were found to be so great that the idea was abandoned. After a few other fruitless attempts of alternate schemes, the principle of the so-called current potential overbalance protection was conceived of. A thorough preliminary study disclosed the soundness of the new principle and as a result it was decided to have the necessary relays developed and installed as a first trial installation on switches (3) and (4) of figure No. 2.

Theory of the New type of Protection

A transmission line of a certain physical characteristic represents a certain impedance "Z". If such line was short circuited at the far end and voltage was built up at the station bus from which the line emanates, the relation between current in the line and the bus voltage would be expressed by $E = I Z$. In other words, the current in the line is proportional to the bus voltage. Referring to figure No. 7, as an example, it is assumed that the impedance drop of the line is 10 per cent of normal voltage with normal line current flowing in the line; that means that the line, short circuited at its extreme end, would require 10 per cent of normal voltage at the station bus-bar to cause normal current to flow in the line. Any greater short circuit current under the same condition would leave a proportionally higher voltage at the station bus-bar.



Figures Nos. 7, 8 and 9.

In case of a line short circuit closer to the station the impedance of the circuit to the short circuit point would become lower and as a result less voltage would be left at the bus-bar, with the same current flowing in the line, compared with a far end short. On the other hand, a short circuit beyond the next substation would offer a higher impedance and in consequence would leave higher voltage for the same current flowing in the line.

A relay (see figure No. 7) consisting of a beam pivoted in the centre, and equipped at either end with a solenoid, one side being equipped with a current coil fed from the line and the other side having a potential coil fed from the station bus, could be adjusted with respect to current and potential coils in such a fashion that the magnetic pull of current and potential coil

would just be equal under condition of a short circuit at the extreme end of the line. A trip circuit arranged as shown would trip the line switch whenever the current coil would overpower the potential coil.

In our specific case of figure No. 7, the two coils could be adjusted for a balance of 10% voltage against normal current. Such balanced condition would exist irrespective of the actual short circuit current as long as the short circuit would be at the same point, since any change in the current coil would also produce a proportional change in the potential coil. A short circuit closer to the station, however, would leave a lower voltage on the potential coil of the relay, because of the lower impedance and as a result would cause the current coil to overpower the potential coil and would thus trip the line switch. A short circuit beyond the end of the line would leave more than 10% voltage per normal current, because of the higher impedance and, in consequence, the potential coil would overpower the current coil and would thus keep the trip circuit blocked. Under normal load condition, the potential coil, with full voltage across, will keep the current coil overpowered and will thus keep the trip circuit blocked. The relation of the magnetic pull on the solenoids under different conditions is more clearly understood from the table accompanying figure No. 7.

Principal Features of the New Protection

From the foregoing it will be seen that the new type of protection has the following valuable features, none of which can be attained by the excess current principle of protection:—

1. Its actuation depends entirely on the relation between current and voltage irrespective of their actual magnitude.
2. The protection will be just as effective, therefore, for currents below normal load current; and in consequence the functioning can be made the same for all operating conditions and irrespective of the generator capacity.
3. The actuation of the relay depends on the location of the short circuit, so that its radius of action can be fixed. In consequence, selective action of switches in series can be obtained by limiting the active radius of the relay, instead of by time selective setting. Thus, it is possible to greatly reduce the time settings of relay protection toward the power house.
4. The protection is unaffected by load conditions and thus does not cause wrong tripping of lines due to unexpected load increases.

In the example of figure No. 7, it was assumed that the relay would be adjusted for such balance that it would just cover the short circuit condition of the line end short. In actual practice, no such accurate adjustment would be possible. In order to be sure that the protection of switch (A), figure No. 7, will be effective for shorts at the end of the line and for troubles in the substation, it will be necessary to set the relay balance of potential and current somewhat higher than the impedance would require, say 12% voltage per normal load current, instead of 10% voltage per normal load current, as was assumed in our example, figure No. 7. Thus, in case a substation bus short creating on the relay 10% voltage per normal load current only, the current coil will have a decided overpowering effect and will thus assure effective tripping. As a result of this higher balance adjustment in the relay of switch (A), its radius of action will extend into the line controlled by switch (B). A short circuit at point (3) in that line would, therefore, be liable to trip switch (A) as well as switch (B), if both were instantaneous. In order to prevent a wrong tripping of switch (A) under these conditions, switch (A) protection would have to be provided with a time lag sufficient to allow switch (B) to clear ahead of switch (A).

In actual practice, the selectiveness between the switches in series was solved by providing each switch with two sets of protection. One set, adjusted for a balance to be effective for line end shorts and substation shorts. This set is provided with a time delay sufficient to allow switch (B) to clear on instantaneous protection. The other set of protection is adjusted for a balance which will confine its active range to its own line. This set can be made instantaneous since its balance adjustment prevents it from operating in case of a short circuit beyond switch (B), so that no time selective adjustment will be required for this set.

The functioning and radius of action of a protection as above described for a system of two lines in series is illustrated in figure No. 8. Distant line shorts on line (A), as well as line (B), are cleared by their respective switches by time limit relays. Short circuits at the beginning of the respective lines are cleared by instantaneous relays. From this example, it will be noticed that the great advantage of the new scheme is that no progressive time setting towards the power house is required, such as is necessary with the excess current principle of protection; but that instantaneous protection can be introduced by applying relays of such a potential current balance setting that their range of action does not overlap the switch ahead.

Current Potential Overbalance Protection for 30-Cycle System

In the Spring of 1920, the first lines were equipped with this new type of protection. The protection was tested out with actual extreme conditions and the result proved fully satisfactory. It was, therefore, decided to equip the whole system with this new type of protection. The 50,000-volt line system is completed and in service since the Fall of 1921, and the power house protection is in the course of completion. Figure No. 9 shows a diagram of the system, indicating in what time short circuits at various points of the system are cleared. From this diagram it will be noticed that the action of the relay depends entirely on the location of the short circuit, the protection being equally effective for minimum as well as maximum generator capacity. The diagram shows how distant line shorts only are cleared by time protection whereas shorts nearer the substations are all cleared instantaneously. The diagram shows also how the new protection permits a very effective power house protection back to the generators, which is in great contrast to the results with the excess current principle (see figure No. 3).

Testing and Operating Results of the New Protection

In the Fall of 1921, after completion of the line protection a series of tests were made to find out any

possible weak feature of the new protection; but the tests proved that the protection was fully effective for all conceivable conditions.

The protection has effectively operated ever since its installation. The outstanding features with respect to the operating results are:—

(a) Since the installation of the new protection there has been no case where the operator had to clear a short circuited line by hand; which latter condition was quite a common occurrence on the previous excess current protection.

(b) There is nothing to indicate that the new principle might cause incorrect actions.

(c) The one inconvenient feature of the protection wherever the protection has to be effective even for currents below normal load current, is the danger that the relay is liable to trip a line on normal load current, should ever the potential circuit be ruptured accidentally. During the two years of service there are two such caset recorded. Both these cases were caused by an open circuit developing in the tap block of relays. Some alteration in the design, however, has eliminated any such recurrence. Other causes of open circuiting the potential circuits are very remote as long as the wiring layout is carefully worked out and as long as the operating staff is properly instructed.

Type of Relay Employed

As pointed out above, the principle of protection is based on an over-powering effect of current against voltage, irrespective of phase angle relation. Any relay principle could be employed therefore, in which current and potential produce mechanical forces, which are proportional to the actual value of current and voltage respectively. The two mechanical forces thus created must cause opposing movements on a mechanical structure so that the actual movement takes place in the direction of the greater force.

The induction principle similar to the induction type excess current relay could be used, having current and potential creating opposing torques on the shaft. Similarly the dynamometer principle could be used to produce opposing torques on a shaft.

In our case it was felt that a simpler and more rugged relay was obtained by using a beam pivoted in the centre and with current and potential solenoid mounted on opposite ends of the beam. Thus the beam is pulled to the side of excess force. All relays were developed along this line. Current and potential coils were provided with taps, so that different adjustments can be obtained. In this way, any desired balance can be established by choosing such taps on the two coils that for a given current and potential value, for which balance is to be created, the ampere turns and thus the magnetic force of the two coils become the same.

General Application of the New Protective Principle

The question may arise whether the system for which the protection was developed was particularly different from others, so that the general application may be limited. In this respect it may be said that very similar conditions exist on all systems, where the total power house capacity is fed over a few large capacity trunk lines. In any such case the sustained short circuit current for distant shorts will always drop near or below the maximum normal load current, so that any excess current relay, set at 150 per cent of normal load current, will become useless. This condition is still more pronounced on modern systems, where the tendency is to install high reactance generators which have a sustained short circuit current of normal load current or less.

The new principle, therefore, represents a much needed, forward step in the art of relay protection which will help to make long distance transmission safer and more effective.

In closing the author wishes to express his appreciation to the Shawinigan Water and Power Company, for its broad-minded policy in supporting and encouraging development work of this nature.

Mention also must be made of the valuable and untiring assistance given by C. E. Cansfield and W. G. Mayhew in the working out of the practical details of the relays, which was just as essential for the final success of the new protection as the correctness of the principle.

Some Points of Contact Between Metallurgy and Engineering

Recent advances towards the Use of Light Alloys in Structural Engineering Practice

Owen W. Ellis, M.Sc., Assoc. M. Inst. C.E., A.M.E.I.C.,
Assistant Professor, Department of Metallurgical Engineering, University of Toronto.

Paper read before the Toronto Branch, The Engineering Institute of Canada, November 2nd, 1922.

Prior to the eighteenth century there existed but few points of contact between the metallurgist and the engineer. The former was mainly engaged in the production of materials for use in the manufacture of domestic appliances such as, stove plates, kettles, cauldrons and smaller household apparatus, agricultural implements and instruments of war. As early as 1414 we find record of the founding of guns in cast iron, while in 1516 no less an achievement than the casting of a five-ton cannon is recorded as having taken place in London, England. Pliny, however, records the use of lead in the manufacture of conduit pipes and that lead sheet was used for the protection of roofs of buildings very early in man's history is quite generally known. The municipal engineer and the architect have continued to make contact with the metallurgist until this day.

Early Development of Iron and Steel Industry

The most important events in the history of this useful alliance of professions may well be recorded here. In France so early as 1664 the iron industry was in such a state of perfection as to be in a position to supply at Versailles a line of cast-iron pipe of which in 1917 some five miles were still in use, while in the United States in 1798 the same industry was in a position to supply the Aaron Burr Water Company with sections for the erection of a cast-iron reservoir in New York, the metal of which sections, when the reservoir was recently dismantled, was as good as it was a century or so ago. About this time — the "eighties of the eighteenth century" — another point of contact was made between the two professions. In 1788 Abraham Darby, the master of the Colebrook Dale Iron Works and the eldest son of the Abraham Darby who first successfully employed coke in the manufacture of iron in the blast furnace, was awarded by the Society of Arts a gold medal for what was the first complete bridge of metal — a structure of cast iron which to-day still spans the Severn, one hundred and thirty-four years or more since it was erected.

Prior to 1728 such malleable iron as was then produced was formed into plate, sheet and rod by the slow and laborious process of hammering. In 1728, however, John Payne constructed a sheet mill, in which rolls were employed for the reduction of the metal and the use of which resulted in a marked increase in the output of products of the type upon which the civil engineer is largely dependent for the success of his work at the present time. Without John Payne's invention the steam engine could scarcely have developed as it did in the hands of Watt and his contemporaries at the middle of the eighteenth century. A yet more important achievement in metallurgical practice transpired in the "eighties" of the eighteenth century. Within the space of two years Henry Cort, the owner of an ironworks at Fontley, Hampshire, patented both the process of puddling iron, that is used with certain important modifications to this day, and the employment of grooved rolls for the production of rods and bars. These two processes were so successfully worked and developed under royalty by iron-masters throughout England that by 1791 the annual output of puddled and rolled iron had reached the then amazing figure of fifty thousand tons per annum. Henry Cort has rightly been named "the father of the iron industry." Following swiftly and made possible by this marked advance in metallurgical practice came the locomotive. By 1825 both the first permanent way for locomotive traffic and the first railway bridge had been constructed.

The next few years witnessed a network of railways spreading throughout the length and breadth of Great Britain, but in this connection no scientific advance of marked importance prior to that made by Robert Stephenson in 1847 has been recorded. At this time the construction of the Conway and the Britannia bridges being under contemplation, Stephenson delegated to Fairbairn and Hodgkinson the work of comparing the mechanical properties of cast and of wrought iron. As a result of the experiments conducted by these two investigators the superiority of the latter product was demonstrated and its use in the construction of his two bridges was decided upon by Stephenson. It was probably as a result of these trials that within two decades cast iron had entirely passed out of use as material for the construction of the main members of railroad bridges, and that until about 1880 wrought iron held the field as the most reliable material of construction.

In 1856 came the Bessemer process of steel manufacture, and later, in 1864, the Siemens furnace, wherein the Martin process of steel production was successfully conducted. The application of electricity by Sir Wm. Siemens in this connection was first dealt with in 1879; it was not until 1898, however, that the electric furnace was used economically, the first electric furnace so to be employed being that of Stassano, a major of the Italian army. Bessemer steel never proved to be very popular with bridge engineers, though the Forth bridge was built of steel made by this process. However with the product of the open-hearth furnace at hand for comparison with wrought iron it was not surprising that the next generation of engineers abandoned the latter material in favour of the former. Hence it was that by 1890 wrought iron had been almost entirely supplanted by open hearth steel in constructional work.

Research on Alloys

The results of researches such as those of Hadfield on manganese-steel published in 1888, and those of Riley on nickel-steel, published in 1889, opened up an avenue upon which such advance has been made by the metallurgist as has given to the engineer those steels upon which, for one example, the future development of long span bridge construction appears to be largely dependent.

It is still less than one hundred years since Wöhler obtained relatively pure aluminium by the device of heating aluminium chloride with potassium. It was not until 1854 that any appreciable reduction in the cost of manufacturing aluminium occurred. About this time, however, the classical work of St. Claire Deville, had enabled the price of this metal to be reduced from about \$110 to about \$6.50 a pound, and by 1892 the development of electrolytic processes for the extraction of aluminium from its oxide had led to a still further reduction in its price — the Héroult-Hall process has made such strides that there was a good supply of pure metal at \$1.70 per pound. At the present time 98 to 99 per cent aluminium may be purchased for about twenty cents a pound. As would be expected, the alloys of this new metal have been the subject of considerable investigation. The ninth report of the Alloys Research Committee to the Institute of Mechanical Engineers, which was presented on January 21st, 1910, may be considered as a milestone on the way of discovery in this connection, since it was to such alloys as were dealt with in this report that Wilm, in 1911, added the element magnesium with the result that light alloys were discovered having the property of hardening with lapse of time subsequent to their quenching — a characteristic analogous to that possessed by steel.

Economics of Alloys of Aluminium for Structural Work

Now it appears to the speaker that it might be of interest to the members of *The Institute* to enquire into

the economics of certain of the light alloys of aluminium in respect of their use in structural work. These alloys hitherto have been almost entirely employed by the mechanical engineer. They have, on account of those properties later to be considered, proved of special service in the construction of aircraft; but few structures wherein these alloys have played a part have been erected. The reason for this will not be far from sight when the subject has been more fully investigated. However, let it be said at once that the item of cost per unit weight of metallic aluminium alone appears to the speaker to stand between these alloys and the possibility of their more general adoption by structural engineers. Whether it will prove economical to employ the light alloys in the construction of, buildings or bridges, will depend upon three things, — the cost per unit weight of the alloy employed; its yield point; and its specific gravity. It is obvious that the total cost of any given structure will vary, directly as the cost per unit weight of the material forming the structure; inversely as the yield point of the material forming the structure, since, other things being equal, the weight of material required will be less the higher its yield point; and directly as the density of the material forming the structure, since the dead load varies directly as the density of the material forming the structure.

If then, C be the total cost of a given structure, c the cost per unit weight of the material forming the structure, Y its yield point and P its density, then C varies directly as cP/Y. For convenience, Y/P may, be termed the specific yield point, and may, for like reasons, be given the symbol s; hence C varies directly as c/s.

If now a given light alloy is to compete successfully with steel, the ratio of its cost per unit weight, c, to its specific yield point, s, i.e. its ratio c/s, must, other things being equal, be less than the ratio c/s for steel. If for structural steel at the source of supply we assume the cost to be two cents a pound, the yield point to be 32,000 pounds per square inch and the specific gravity to be 7.85, we have for c the value 2, for s the value 4,076, and for the c/s ratio the value 0.00049. If then a given light alloy is to compete successfully with steel its c/s ratio must be equal to or less than 0.00049.

Composition and Mechanical Properties of Duralumin

Let us now consider how duralumin, the light alloy discovered by Wilm in 1911 which has been referred to above, stands in this respect. Leaving for the moment the question of its cost per unit weight let us turn our attention to its composition and to its mechanical properties. Those complex light alloys classified under the name duralumin contain from 3.5 per cent to 4 per cent of copper, from 0.5 per cent to 1 per cent of manganese and up to 0.5 per cent of magnesium. There are generally present in these alloys small proportions of silicon, an element which has been shown by Rosenhain and his collaborators to exert a most important influence upon certain of the peculiar properties of these alloys.

In the cast state these alloys offer little to surprise, in so far as their mechanical properties are concerned. The average tensile strength of the same, as cast in sand, is but 15,600 pounds per square inch, that of the alloy, as cast in chill, is 14,200 pounds per square inch — the ductility and the resistance offered to shock by these alloys is practically nil. Thermal treatment of these cast alloys, while it does result in an improvement in their tenacity, has not the least influence upon their ductility and resistance to shock. The reduction of these alloys in the rolls or by drawing can be successfully accomplished at temperatures in the vicinity of 450°C. If, however, these alloys be annealed at 450°C., subsequent to casting they can be reduced in the rolls at ordinary temperatures without appreciable difficulty. For sheets of thickness in excess of about one-half inch the maximum percentage reduction in thickness of strip that can be thus effected without rupture of the sheets is about 33⅓ per cent. The mechanical properties of duralumin sheet such as has first been rolled at room temperature, has then been annealed at 450°C., and has finally been cooled in air, are about as follows:—

	Yield point lbs. sq. inch	Maximum stress lbs. sq. inch	Elongation per cent. (1 = plus or minus 8 \ a)
Longitudinal............	18,500	46,000	18
Transverse.............	17,100	37.000	10

Here then, is a material possessed of the tenacity of a normalized mild steel containing about 0.085 per cent of carbon and but little manganese. Its ductility is, however, low in comparison to that of such steel. If such rolled sheet as is referred to above be heated to a temperature of 475°C., and quenched in water at 20°C., it is found to have undergone a profound change in constitution. Tests made on the material immediately after quenching show it to be possessed of the following mechanical properties:—

Yield point lbs. sq. inch	Maximum stress lbs. sq. inch	Elongation per cent.
14,200	42,700	20

Apart from the fact that the values for the elastic limit and the maximum stress of the alloy are somewhat less and those for the other constant are somewhat greater, no appreciable change can be said to have occurred in the same. With lapse of time, however, a continuous and radical change occurs in the alloy which results in a remarkable rise in its tenacity. Tests made on the last alloy, four days subsequent to its quenching, showed it to have the following characteristics:—

Yield point lbs. sq. inch	Maximum stress lbs. sq. inch	Elongation per cent.
31,300	54,100	22

The material is now possessed of the yield point and of the tenacity of a 0.14 carbon steel (annealed at 866°C., the annealing temperature recommended for this steel by the American Society for Testing Materials) and a percentage elongation considerably less than that of the same steel (39.5 per cent on two inches).

Tests on a Duralumin Channel

In this connection may well be recorded the results of tests quoted by Rosenhain, Archbutt and Hanson in the last report of the Alloys Research Committee to the Institute of Mechanical Engineers. Tests were made in 1911 on a duralumin channel with the following results:

Yield point lbs. sq. inch.	Maximum stress lbs. sq. inch	Elongation per cent. on 3 inches
37,900	59,400	16.6
39,200	61,600	20.3

From the same channel, samples were removed for tests in 1921, the results of which were as follows:

Yield point lbs sq inch	Maximum stress lbs sq inch	Elongation per cent on 3 inches
46,100	64,300	15.3
46,400	62,000	14.7

Here is material possessed of such tenacity as would make it quite acceptable for service under the structural steel specification of the Canadian Engineering Standards Association. Its ductility, however, is such as to make it doubtful whether it could be successfully employed in place of structural steel in this connection.

Determination of the c/s Ratio of Duralumin

The c/s ratio for this material may now be determined. At the present time duralumin sheet costs about 30 per cent more than does aluminium sheet, ranging from forty to forty-five cents per pound, while duralumin rod may be purchased at about the price of pure metal rod, thirty cents per pound. The yield point of duralumin may, we think, quite justly be taken as 40,000 pounds per square inch. Its specific gravity is in the neighbourhood of 2.8. Its specific yield point is, therefore, 40,000/2.8 or 14,300 and the c/s ratio, assuming a price of 35 cents per pound will be 35/14,300 or 0.00245. The c/s ratio for duralumin is, therefore, about five times that of our standard steel. Let it here be noted that the scales have been slightly weighted in favour of the steel. It is a matter of fact that under the Canadian Engineering Standards Association specification for structural steel material possessed of a yield point of as little as 27,500 pounds per square inch could pass for service, that is, material such as would have a specific yield point of 3,503 and a c/s ratio of 0.00057, and from what we have seen an elastic limit of at least 45,000 pounds per square inch may sometimes be expected of duralumin. The c/s ratio of such material would be as low as 0.00218; about 3.82 times that of the steel.

Important Alloys Recently Investigated

Of the light alloys recently investigated those referred to in the eleventh report of the Alloys Research Committee to the Institute of Mechanical Engineers as alloys A, E, F, G and Y, are of particular importance. The first of these alloys — alloy A — contained, apart from aluminium, 20 per cent of zinc and 3 per cent of copper. It was possessed of a specific gravity of 3.1. After much experiment it was successfully reduced by hot rolling to rod 1⅝ inch in diameter and less. The results of tensile tests upon this alloy in the form of rod are recorded below:—

Diameter of rod (hot rolled) inches	Elastic limit lbs. sq. inch	Yield point lbs. sq. inch	Maximum stress lbs. sq. inch	Elongation per cent. on 2 inches
1⅝	26,400-29,100	39,400	59,100	17
1¼	-	41,400	61,400	18
⅞	-	41,000	60,500	21
½	-	39,000	59,800	(on 1″) 30

The safe range of alternating stress, (Wöhler test), for this alloy at 20°C is plus or minus 19,500 pounds per square inch. This alloy is possessed of a tensile strength in the hot-rolled state equal to that of a 0.18 carbon steel annealed at 858°C., the annealing temperature recommended for this steel by the American Society for Testing Materials. It is a somewhat cheaper alloy than duralumin and should cost about twenty-eight cents per pound. Assuming the material to have a specific yield point of 39,000 pounds per square inch, its c/s ratio would be 0.00222; about 4.5 times that of our standard steel.

The second of these alloys — alloy E — contained, apart from aluminium, 20 per cent of zinc, 2.5 per cent of copper, 0.5 per cent each of magnesium and of manganese and proportions of iron and silicon not exceeding 0.2 per cent. Tabulated below are the results of tensile tests on this material in the hot-rolled state, and quenched from 400°C., and aged for five days.

Diameter of rod inch	Yield point lbs sq inch	Maximum stress lbs sq inch	Elongation per cent on 2 inches
⅞	53,100	66,500	15
⅞	48,400	91,200	9

In this case the safe range of alternating stress is plus or minus 21,700 pounds per square inch. This alloy is possessed of a mean c/s ratio of about 0.00174, a ratio which is about 3.6 times that of our standard steel.

The third and fourth of these complex alloys — alloys F and G — were of the following analyses:— F, copper 2.5; zinc, 20.0; magnesium 0.5; manganese 0.5; silicon 0.75, and the remainder aluminium. G, copper 2.5; zinc, 18.0; magnesium 0.35; manganese 0.35; silicon 0.80 and the remainder aluminium.

The results of tests made on the alloy F, are recorded below: —

Condition	Yield point lbs. sq. inch	Maximum stress lbs. sq. inch	Elongation per cent on 2 inches
⅞ inch hot rolled rod, quenched from 400°C. and aged for 5 days.	56,700	80,600	16
0.04-0.05 inch sheet similarly treated.	68,100	79,300	19

For this alloy in the first condition the c/s ratio is as low as 0.00153, for the same in the second state the ratio is as low as 0.00127. The ratio is in the first instance about 3.13 times and in the second case about 2.59 times that of our standard steel. The mechanical properties of alloy G, quenched from 400°C and aged, are as follows:—yield point 68,500 pounds per square inch; maximum stress 77,500 pounds per square inch; elongation 19 per cent. In this case the alloy was tested in the form of sheet 0.04 to 0.05 inch in thickness which had been quenched and aged. The c/s ratio for this alloy is 0.00127, practically the same as the last, and is about 2.59 times that of our standard steel.

The mechanical properties of the last alloy we shall consider in this connection — alloy Y — have been referred to by Rosenhain, Archbutt and Hanson in the following terms, — "The material shows an ultimate stress of 26 to 27 tons per square inch (long tons of 2,240 pounds) with 16 to 18 per cent extension on two inches in the case of sheet 0.5 inch thick; thinner sheet, 0.18 inch thick, shows tensile strength of 27 to 28 tons per square inch with elongation of 15 to 17 per cent on two inches." Experiments by these observers on samples of this alloy prepared by cold rolling at the Royal Aircraft Establishment and quenched subsequent to deformation from a temperature of 520°C., showed the treated alloy to be possessed of the following mechanical

properties: — yield point 47,000 pounds per square inch; maximum stress 62,700 pounds per square inch; elongation 18 per cent on 2 inches.

Both the cost per unit weight and the density of this alloy approach closely to those of duralumin. Assuming 47,000 pounds per square inch to be the yield point, 2.8 to be the specific gravity and thirty-five cents per pound to be the cost per unit weight of the Y alloy we obtain as the c/s ratio the value 0.00201 — 4.10 times that of our standard steel.

Possibility of use of Light Alloys in the Structural Field

Now it will be noted that the yield points of all the alloys we have considered are such as would allow of their acceptance for service under the Canadian Engineering Standards Association specification for steel for bridge construction, and that their tenacities are such as would permit of similar treatment, but that their ductilities are in most cases somewhat less than those accustomed to the use of structural steel would feel justified in allowing to pass unnoticed. To this aspect of the situation we will refer later. For the present it may be emphasized that, but for the high cost of these alloys, their immediate use might be expedient in certain instances. The cost factor is that which in the c/s ratio weighs so heavily against these light materials. We have dealt in terms of the delivery costs of these light alloys, and of steel, not in terms of the cost of these same materials in place in the finished structures. When consideration is taken, of the lower cost of transportation, and note is made of the lighter machinery that would be required to cope with the problem of erection, and when it is considered that a brisk demand for these materials might result in a material reduction in their price — it might have an exactly opposite effect at first — and, lastly, when it is remembered that both the methods of manufacture of these alloys and the alloys themselves are subject to improvement, there is good reason for the opinion that their use in construction is not likely long to be delayed.

Reverting to the question of the ductility of these alloys, it should be remembered that, while a given minimum value for the percentage elongation of steel may serve as a criterion of the toughness of that product, it does not of necessity mean that a similar value for this factor in the case of another alloy will serve the same purpose in identically the same way. It has been clearly demonstrated that while notch toughness may serve to distinguish between the good and the bad of a given batch of material of about the same composition, it cannot be relied upon to determine the relative merits of material of totally different character and composition. The same argument may be applied in some measure to the question of ductility. However, a point in this connection, worthy of note, is that the safe range of stress reversal for these alloys is only about half that of structural steel.

In table No. 1, are collected the results of the determination of the c/s ratio for these light alloys, together with the ratio of the c/s values of these light alloys to those of steel and their approximate price per pound.

TABLE No. 1

Material	c/s	Ratio of c/s value of alloy to c/s value of steel	Approximate price per pound	Reduced price per pound (approx.) to compete with steel.
			cents	cents
Steel (lbs. sq. inch) (32,000 yield point)	0.00049	1	2	2
Duralumin	0.00245	5.0	35	7
Alloy A	0.00222	4.5	28	6
Alloy E	0.00174	3.6	28	8
Alloy F (a)	0.00153	3.1	28	9
(b)	0.00127	2.6	28	11
Alloy G	0.00127	2.6	28	11
Alloy Y	0.00201	4.1	35	8

A brief consideration of the results contained in this table will serve to show that, if these alloys are to compete successfully with steel, they must be reduced in price to the values quoted in the last column. Here again let it be observed that in arriving at these values it has been assumed that the cost per unit weight of these materials in place within a given structure is a constant multiple of the cost per unit weight of the materials at their place of origin. In order to make plain the difference in the cost of erection that is likely to ensue as a result of the employment of these light alloys it is only necessary that attention be directed to table No. II.

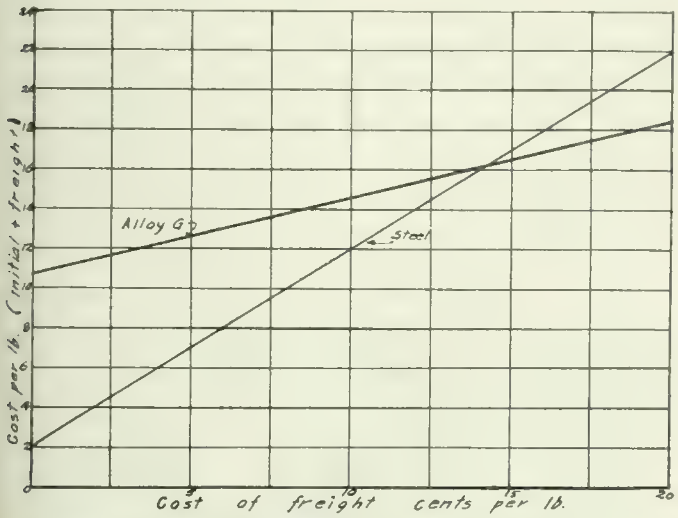
TABLE No. II

Dimensions of I-beam section		Approximate weights per foot in pounds.	
D inches	B inches	Steel	Light Alloy
3	1½	4	1½
6	3	12	4½
9	4	21	8
12	5	30	11¼
15	6	45	17
18	6	55	20½
24	7½	90	33¾

A moment's thought will make it obvious that in the erection of certain structures the use of steam or electric driven lifting machinery could be entirely eliminated were the light alloys employed in place of steel, not that this of necessity means a lessening of the total cost of erection. Nevertheless, it is possible that the freight charges coincident with the transportation of lifting machinery could in such extreme cases thus be entirely eliminated. In any case, such mechanical devices as are required in the erection of steel structures could be replaced by others of much lighter type were the light alloys employed.

Yet another point worthy of consideration here is the cost of shopwork that is likely to ensue in connection with structures made of these light alloys. The specific yield points of the light alloys are considerably in excess of those ever likely to be obtained in such alloy steels as could economically be employed in construction. Consider, for example, the nickel-steel occasionally employed in bridge construction. This has a yield point of about 60,000 pounds per square inch, hence a specific

yield point of about 66,000/7.7 or 7,800, almost half that of duralumin, the light alloy of those we have considered possessed of the least value for this factor. The machineability of nickel-steel, however, is considerably less than is that of the light alloys, which are relatively easy to ream or drill. Hence, those extra expenses attached to the use of the special steels on account of the concurrent increase in their resistance to penetration and their tenacity, are not likely to be experienced when the light alloys are in employment.



Approximate effect of freight charges on choice between steel and light alloy G.

With the view of indicating the approximate manner in which the cost of freight is likely to effect the question of choice between steel and the light alloy G, the writer has prepared the above graph. The values plotted therein have been arrived at in a manner similar to that in which the values given in table No. 2 of the paper have been obtained; the ratio of the cost per pound plus the freight charge per pound, to the values 2.6 for alloy G, (see table No. 1, column 2), and 1, for steel, have been plotted. As a result it is demonstrated that the freight charge would have to attain the figure of fourteen cents per pound before alloy G could compete with steel. It is here assumed that other costs, shop costs and erection costs — are unchanged. This, as has been shown, is not likely to be the case.

Finally, the costs of freight and of transportation of the structural material itself, especially in a country of vast distances such as is Canada, are of immense importance. To the cost of structural materials per unit weight at their place of origin there may be added, under certain circumstances, freight charges of as much as five cents per pound. Such freight charges may sometimes become disproportionate, even prohibitive, items of expense. If, therefore, these charges could, by the use of light alloys, be reduced to practically a third (to something at any rate greater than 2.95/7.85 or 1/2.66) of their amount, the use of such alloys might be abundantly justified in certain situations. In outposts of the Dominion where the erection of buildings and of other structures, which now would be made of steel, this is essential for the successful issue of all manner of engineering enterprise. The possibility of the elimination of freight charges on plant required for erection has been referred to already.

It might well be that in certain circumstances these three items of expense — erection costs, shop costs and freight costs — might sufficiently reduce the total cost of erecting a structure in a light alloy, even at present prices, to enable its use in place of steel to be seriously considered.

The question of corrosion in this connection is a vital one, although no more vital than is that of the corrosion of steel. .The protection of aluminium can be accomplished as can that of its alloys. The use of these alloys in situations where they are likely to be brought into contact with sea water could not, it is thought, be considered at present. Much more work requires to be done before a definite statement as to the reliability of protected light alloy structures under these conditions could be made. In the construction of buildings where protection from wind and weather is afforded, the use of these alloys could certainly be recommended, and there does not seem to be any reason why their use in the open, suitably protected, should not be considered. The opinions of Dr. Rosenhain, who has been as closely associated with the advancement of these alloys as any man, may be quoted here and with his words we may well close this discussion of what the speaker feels is likely to be, in the not distant future, a further point of contact between the metallurgist and the engineer. "In the largest bridges and roofs, it is well known that the greater part of the load which the structure has to bear consists of its own weight, the so-called live load or useful load, such as a railway train, representing only a small fraction of the weight of the structure itself. Actually, the longest possible span which can be constructed is limited by this consideration of the weight of the structure itself and the stresses which it imposes upon its members. The use of a material of very much lower density and of equal strength with mild steel, therefore, suggests the possibility of very greatly increasing the maximum possible span. There are, of course, not many situations in which these very huge spans would be required, but apart from that particular point, it must be borne in mind that the cost of a structure of large span is largely due to the fact that metal has to be provided mainly to bear the weight of the structure itself. It would certainly be possible to reduce this weight to a very considerable extent by replacing steel by aluminum alloys for those parts of the structure, at all events, which are responsible for the greatest development of stress in the remaining members. As an example of what is meant, the central portion of a cantilever bridge may be cited. This is really a small independent girder connection the ends of the great cantilevers, and it is the weight of this central portion of the span which, to a large extent, governs the size and cost of the cantilevers themselves. By replacing this central span by a structure of aluminum alloy, a very large saving in the weight and cost of the steel constituting the rest of the structure could be effected, and it is, at all events, worth suggesting to bridge designers that the calculation of the relative cost of two structures, one made entirely of steel, and the other in which the central portion was made of a light alloy, is worth considering. Similar considerations also apply to roofs and other structures having exceptionally large span, where the weight of the structure itself enters largely into the cost of the material employed in building it. In the case of roofs, particularly, where the structure is protected from the action of the weather, the question of corrodibility does not enter seriously into the case. In any structure, however, the application of suitable protective coatings could be no more difficult in aluminum alloys than in the case of steel, and in the absence, at all events, of sea water, or spray derived from the sea, the relative permanence of an aluminum alloy structure and a steel structure, both properly protected, would not be very different."

Paint as a Protection for Steel Structures

Fundamental Requirements in use of Paint for the Protection of Steel.

John Grieve, A.M.E.I.C.,
General Manager of Sales, Dominion Paint Works Limited.

Paper read before the Montreal Branch, The Engineering Institute of Canada, October 26th, 1922.

Steel is the backbone of all structural design. The base on which engineering stands, in its relation to industrial development as an indispensable profession, is the manipulation of steel to its various uses. Every such development is dependent for success upon the service of the materials used in the design, their efficient distribution and the low maintenance costs due either to operation or depreciation. The importance of arresting corrosion is admitted by engineers as it is known that steel will decay, if natural agencies are allowed to act on it, more rapidly than any other material used in construction.

The transactions of almost every engineering society include papers on this subject — all kinds of theories have been advanced and suggestions submitted, but the subject has not yet attained the attention which its importance demands.

Facts Which Have Militated Against Proper Consideration of Corrosion

(*A*) *Compartively recent acceptance of electro-chemical explanation.*

Practically the whole development of steel construction has occurred during the past fifty years, while the electro-chemical explanation of corrosion has been advanced, made the basis of tests and been generally accepted only within the past twenty years. It is evident therefore that for about thirty years the whole subject of corrosion was indefinite in the minds of many and few sound methods were advanced to combat it.

When one considers that practical exposure tests of selected paints require from three to four years for preliminary investigations before the qualities of each film can be determined, and thereafter from six to ten years to obtain the comparative results for service efficiency of the combined films, one can readily appreciate that only within the past decade have the anti-corrosive merits of some paint ingredients been truly appreciated.

(*B*) *Lapse of time necessary to judge value of service tests.*

It is necessary in the manufacture of paints to test chemically, pigments, gums and oils used, prior to their incorporation in the paint, to insure freedom from undesirable impurities. In the physical laboratory also, many preliminary tests can be made to ascertain if a film has the desired qualities, but just as accelerated physical laboratory tests do not indicate the action which takes place gradually over an extended period between pigments and vehicle under exposure, so chemical analysis, after the paint is manufactured, does not indicate — except perhaps in elementary paints — the quality of ingredients, skill of compounding or service value of the paint.

Authorities have recognized for a long time that by ageing, in some cases for several years, oils, varnishes and mixture of these with pigments, very much enhanced service value is obtained for the product. Chemical laboratory analysis, even in conjunction with accelerated physical tests, does not indicate or take into consideration this ageing of materials. Therefore, between paints of similar analysis there is no assurance of equal service value. The only true tests are those where paints are subjected to service exposure tests under conditions to which the paint will be subjected. These necessarily involve time.

The importance of actual exposure tests and the doubtful value of accelerated laboratory tests is mentioned by all authorities who have had an opportunity to compare results. A. S. Cushman and H. A. Gardiner in their study of "Corrosion and Preservation of Iron and Steel", emphasize this point as follows: — "The results of the acceleration tests may be taken as fairly good evidence of how the paint will work in practice but a series of practical exposure tests should also be started so that definite knowledge can be obtained in regard to their protective value". Again, they state that, "Owing to the nature of corrosion it is probably true that no perfectly reliable acceleration test for corrosion resistance can be devised. Corrosion is the natural process of rust formation, that is to say, in very slightly acid media, it is a question of comparatively slow growth under special conditions, and any effort to hasten the action changes all the conditions of equilibrium, producing an entirely different order of phenomena".

The opinion that the physical state of the paint after it is manufactured is a more vital factor than the composition of the paint and the importance of exposure tests to demonstrate paint value, is also emphasized by J. C. Smith in his paper to the International Association for Testing Materials at Copenhagen in 1909, as follows:— "Although opinions vary as to what is theoretically the best pigments or, more correctly, combination of pigments, for the manufacture of protective coatings, the general consensus of technical opinion seems gradually to be that, with certain more or less obvious reservations, the composition of the paint is less important than its physical state, and that one pigment or blend of pigments is more efficient than another as the basis for a protective paint, mainly according to the degree in which it tends to produce certain definite physical and mechanical effects in the ultimate protective film. The problem that remains is the selection of that blend of pigments, suspended in a suitably adjusted vehicle, (the paint as a whole possessing the necessary physical properties), which will, under known conditions as to exposure and climatic conditions, yield a satisfactory protective film. Only exposure tests can solve this problem."

(*C*) *Influence of economic situation on past practice.*

In the past, most steel structures have been superseded because they were inadequate to meet more modern development and not because the lasting quality of the structure had become impaired. The feeling

among engineers in consequence has been that paint materials and the subject of protection were minor considerations, and therefore there has been no economic demand for improved application or shop practice. Because of the demand for steel construction, engineers generally have devoted their attention to developments in design and the subject of conservation or maintenance of the structure has been allocated as of secondary consideration. This is demonstrated by the fact that many engineers ignore the effect of variations in qualities of materials built into an exposed structure and by the fact that most of the tests on corrosion have seldom been completed or followed up. Some engineers are now taking a more active interest in corrosion because of the present demand for conservation. The cost of steel construction and the realization that these are handicapped under present practice by heavy maintenance charges which, if capitalized, would necessitate a very large investment to provide interest to meet them, are apparently responsible for an economic demand to reduce maintenance costs.

Causes of Corrosion

Efficient protection of iron and steel structures by paint can be obtained only when the true causes of corrosion are appreciated and effective means taken both in the design and maintenance of a structure to combat these causes. At the present time no absolutely indestructible or permanent protection is known, but by the use of properly selected paints in conjunction with efficient design and application, maintenance work may be reduced to a minimum much below the present average and the structure maintained without appreciable deterioration.

The deterioration of steel structures is caused by electro-chemical action between the steel and the surrounding elements or, what is often overlooked, by similar action between various members or portions of a structure. A brief explanation of such electro-chemical action in its relation to steel might be worded as follows:—All ferrous metals when placed in water or in an atmosphere which acts as an electrolyte, or in such conditions of exposure that a film of moisture may condense on them, tend to dissolve. This tendency is governed by impurities, unequal stresses and unhomogeneous nature of the metal in each case, and by the impurities in the liquid or gaseous film. Certain points in the metal, which have varying tendencies to go into solution, form electrodes of opposite nature, and corrosion takes place in proportion to the potential difference between these points, governed by the value of the electrolyte connecting them. The more concentrated the hydrogen ions in the electrolyte, (for instance where acids are present), the higher will be its electric conductivity, and the more rapid, consequently, the corrosion of the positive electrode. It is evident, therefore, that in a fabricated structure this action between points applies not only to each surface in detail but to the whole structure where the sections and members may be of varying composition or subject to initial stresses.

Owing to the process of manufacture by heat, steel plates and shapes are always coated with scale which is the black magnetic oxide of iron. This, though it has at first a metallic blue sheen, is not part of the metal, and as it is electro-negative to the steel or iron, it forms a surface which actively promotes corrosion from the moment it is exposed unprotected to the atmosphere. This corrosion is hastened in proportion to the amount of moisture in the air and any acid present. The mill scale as it corrodes changes into a hydrated red oxide of iron holding twenty-four per cent of hygroscopic moisture which is never dried out under atmospheric heat conditions, but acts as an accelerator of further corrosion. As this change takes place the scale increases to more than double its bulk, gradually loosens and flakes off.

Paint applied on top of corroded scale, even though the oil appears to penetrate the scale, will only retard corrosive action but will not neutralize the electronegative polarity or bond the scale to the underlying metal. The oil cannot displace the moisture already present in the scale, therefore the paint merely acts as a covering under which active corrosion proceeds. The gradually increasing bulk of the scale under this action over-stresses the paint film as it is lifted from the metal, while the iron oxide formed has a tendency, where oil or varnish vehicles are used, to make the paint film brittle, with the result that holes and cracks develop in the film through which moisture penetrates under the paint and corrosion is further promoted. Blue mill scale adheres so firmly to the metal that it can only be removed by means of the sandblast or the pickling process. It is also practically impossible to wholly remove partly corroded scale by wire brushes, scrapers or hammers. Under the best practice for protection this also should be removed by sandblast or pickling process. So long as any mill scale remains on the steel surface, one has a potential corrosive agent under the paint which will become active the moment contact can be established through an electrolyte with the metal. An effort along the lines of improvement is illustrated by the fact that the largest steel fabricating shop in this country has recently installed a pickling plant and is prepared, if customers are willing to pay the cost, to treat steel in this way and in consequence remove the mill scale before the first coat of paint is applied.

Building-up a Protective Paint Film

It is evident from the explanation of corrosion that the function of paint is to act as a lasting insulator between the electrodes of varying solution tension or electric potential value, and prevent contact between these and the electrolyte. The problem in practice is not only to obtain this quality, but to combine in the film the following necessary features, the lack of which, would result in expensive maintenance:

1. The film must be suited to the exposure to which the structure is subjected in order that moisture or gas acting as an electrolyte may not penetrate the paint and overcome the insulation.
2. The paint must adhere so closely to the surface that in the event of any local damage to the film no source will be established from which corrosion can creep under the paint and in time remove the whole in flakes or sheets.
3. The film must be tough and elastic in order that it may withstand abrasion and in the event of any mill scale under it, resist for the longest period without fracture.
4. The Paint must be of such a nature that as it loses its value, due to exposure, and recoating becomes necessary, a suitable surface is left on which to apply maintenance paint so that minimum expense may be involved.

Protection by a single application heavy film paint has been sometimes advocated, but in the first place it is almost impossible to obtain such a paint with toughness penetrating the film as required, combined with adhesive

and waterproofing qualities. In the second place, such a film would require to be applied before the steel was fabricated in the structural shops in order to protect the steel before the blue scale became corroded and scaling started, in which case it would probably become damaged during transition through the shops, transportation to the site or during erection of the structure. To arrange for it to be applied in the field after erection of the structure would entail expensive cleaning of the steel under difficult inspection conditions and trouble would certainly arise in the treatment of many inaccessible or intricate built-up sections. Paint makers are constantly experimenting under working conditions at their plants to develop improvements on the protection of steel, but so far, no single coat paint has been developed that has given satisfactory results combined with practical efficiency.

The practice which has produced most satisfactory results has been when a combined film is built up of two or three units, each one adapted to the specific purpose required of it. The combined film must have integral freedom from impurities such that it will not permit outside elements, or ingredients in its composition in conjunction with outside elements, to form electro-chemical combinations and promote corrosion. This film must have sufficient thickness to ensure efficient life as the action of the elements causes gradual oxidation and disintegration.

The first unit of a combined film is the shop coat, the function of which is to prevent the start of electro-chemical action on the surface while the steel is easily accessible and so form a base on which exposure or field coats are placed. As it is the base of all protection, it should receive the most careful consideration. It must dry hard with strong adhesive and anti-corrosive qualities and yet be sufficiently elastic and waterproof to resist damage in the handling of the structure during its transition through the fabricating shops and for a period until the steel is erected, otherwise corrosion of the surfaces is started before the exposure or field coats are applied. It must be a light coat, as otherwise, when used as an assembly paint between surfaces in contact through which hot rivets are driven it is liable to burn out, forming gas pockets and be the cause of loose rivets. It should be easily spread in order that it may be worked into all portions of a built-up section without difficulty by the shop labour.

The second unit in the combined film should be applied on top of the construction or shop coat of paint, after the structure is erected and any abraised portions have been spotted with the shop coat. This paint is required to build up the paint film and form a reservoir life for the exposure paint, also to ensure that the shop paint which has weathered during erection of the structure is reinforced and free from any minute checking, especially if the structure is large and has taken some time to assemble, or where it is composed of light sections the edges of which are difficult to cover with one coat of paint. This paint should be a steel-surface anti-corrosive paint but slightly more elastic than the regular shop paint.

The third unit in the combined film is the one subjected to the exposure and, just as the shop coat is the base on which the paint film is built-up and on which depends the success of protection against electro-chemical action on the surface of the steel, so the function of the exposure coat is to protect the shop coat against the various conditions to which the surface is subjected during its exposure.

It is evident that the conditions which govern steel buried in the ground where the paint film is subjected to fairly uniform temperatures without sudden change but constantly to the action of moisture impregnated with mineral salts, etc., are entirely different to the conditions governing exterior atmospheric exposure where the action of the sun and frost, with temperature variations of over one hundred and twenty degrees Fahrenheit and call for altogether different qualities in the exposure paint film.

One of the causes of high maintenance costs in steel structures is the neglect to apply paint on an exposed surface until not only the field coat of paint has lost its vitality, but corrosion has so far attacked the under coating that bare portions of the steel are exposed, and thereafter applying only one coat of field paint. It should be remembered that in many cases the most effective field coat is not a proper shop or steel-surface paint and that it may not stop corrosion spreading under the surface if it is not applied on top of an anti-corrosive paint. If corrosion is far advanced on a structure, at least two coats of paint should be applied after the surfaces have been thoroughly cleaned, and the first of these should be a real anti-corrosive steel-surface paint fulfilling all the requirements of a shop or construction paint.

Points to be considered in Purchasing Paints

There are one or two essential points in the use of steel paints, however, that should be carefully considered by purchasers when in the market for paint:

1. The manufacturer should always be advised of the exposure to which the paint will be subjected and if possible the nature of the paint already on the surface.
2. Paints containing linseed oil should not be applied on top of asphaltic paint, as action will set up between the paint films and the protective value of both coats will be destroyed.
3. Paints containing linseed oil should not be applied over or under tar paints, as similar action will occur and active corrosion may be immediately promoted.
4. Paints should never be purchased on the basis of price per gallon, as this does not give any comparison of either cost of work or service done. Comparative costs should be based wholly on service records of paint and cost of application per unit of tonnage or area.

It may be of use to have the approximate tonnage of various structures which may be covered by one gallon of good paint, (one coat), based on the thickness of sections:

Sections 3/16 to 1/4 inch thick — transmission towers — 1½ to 2 tons per Imperial gallon.
Sections ⅜ to ½ inch thick — light mill buildings, highway truss spans — 2½ to 3 tons per Imperial gallon.
Section ½ to ¾ inch thick — medium building construction and light railway truss spans — 3 to 3½ tons per Imperial gallon.
Sections ¾ to 1 inch thick — heavy building construction and railway girder spans — 4 to 5 tons per Imperial gallon.

In presenting this paper on "Paint as a Protection for Steel Structures" to *The Institute*, it is the writer's hope that it may awaken interest in this important subject and that an effort may be made to improve the general practice of protection. The results of service records are the base of all future economy and reliable records can be obtained only when an effort is made by everybody interested to co-operate in the selection and use of good paints and their proper application.

VOL. V December 1922 No. 12

Greetings.

For the greater faith in the profession, for the intense loyalty and enthusiasm for the Institute that has characterized the efforts of our members during the past year we have cause to be thankful.

In acknowledgment of these and the many personal kindnesses extended to him during the year your secretary extends to the members his heartfelt thanks, and, lacking better facilities for sending a personal message to each, takes this opportunity of wishing you, one and all, a joyous Christmas and a brighter happier and more prosperous New Year.

Fraser S. Keith.

Annual Meeting

The annual general meeting of *The Institute* will be held at Montreal on Tuesday, January twenty-third, nineteen twenty-three, at the headquarters of *The Institute.* The meeting will be devoted almost entirely to the business of *The Institute.* There will be no general professional meeting at the time. It is expected, however, that a banquet will be held in the evening, the guest of honour to be one of the most outstanding men in the national life of Canada, provided suitable arrangements can be made.

Two professional meetings are already proposed for next year and are now under discussion by the Branches interested, one to be held in the Maritime provinces and the other at Quebec under the administration of the Quebec Branch. More definite announcements regarding these meetings will be given at a later date.

Making the Library Valuable

How to make the library at the headquarters of *The Institute* of greater value to the membership at large is a problem that has been receiving the attention of the Library and House Committee, and in that connection suggestions would be appreciated from any member of *The Institute.* It is realized that owing to lack of funds for a number of years the library has not been kept stocked with the latest technical books, although as a reference library it is a valuable asset. This year there is available a sum of money voted by Council to the Library and House Committee, and if any member has any suggestion regarding individual books which he thinks should be found in the library, his suggestions will be welcome.

With the existing arrangements between *The Institute* and the United Engineering Societies Library in New York, whereby our members have the privilege of consulting the magnificent library in New York and also securing photostat copies of any article or articles desired, our members have access to practically all of the engineering literature in the world.

In order to make the library of greater value to out-of-town members it is proposed to print a catalogue of the books now available at headquarters. A start on this is being made in *The Journal* where a list will appear each month until the catalogue is completed. It will then be printed in regular catalogue form and made available for the members.

Although we have not at the moment available to be taken from the library the more recently published technical books which would make a valuable addition to the library, it is hoped by making a selection of such from time to time to bring the library eventually to a higher standard of usefulness. In making suggestions the committee would like the title, and names of author and publisher of the book suggested. It is hoped there will be a ready response to this appeal of the Library and House Committee.

Proposed Changes in By-Laws

Approved by Council, Tuesday, November 21st, 1922

The following proposals to change the by-laws of *The Institute* have their origin almost entirely in the recommendations of the Committee on Policy as submitted in their report. This report was approved by professional meetings of *The Institute* at Vancouver and Winnipeg, and in general has had the approval of Council by the appointment of a number of committees suggested in the report.

The changes presented herewith to the membership were prepared by a committee of the Council in which was included the chairman of the By-laws Committee and the chairman of the Committee on Policy. The suggestions to change sections seven, eight, thirty-eight, fifty-seven, sixty, sixty-six and sixty-seven have their origin in Council and are not definitely related to the recommendations of the Committee on Policy.

It is believed by Council that the above proposed modifications are in the interests of *The Institute* and, if put into effect, will work to the benefit and advantage of this organization.

Objects

Section 1:—
Change entire section to read:—

"The objects of *The Institute* shall be (a) to develop and maintain high standards in the engineering profession, (b) to facilitate the acquirement and the interchange of professional knowledge among its members, (c) to advance the professional, the social and the economic welfare of its members, (d) to enhance the usefulness of the profession to the public, (e) to collaborate with universities and other educational institutions in the advancement of engineering education, (f) to promote intercourse between engineers and members of allied professions, (g) to co-operate with other technical societies for the advancement of mutual interests, (h) to encourage original research, and the study, development and conservation of the resources of the Dominion."

Membership

Section 2:— No change.

Section 3:— **Classes of Members**

Change "Associates" to Affiliates" in second and sixth lines, and further change to read as follows:—

"The membership of *The Institute* shall consist of Honorary Members, Members, Associate Members, Juniors, Students, and Affiliates. Members, Associate Members, and Honorary Members who have previously been corporate members, shall be styled corporate members. Juniors, Students, Affiliates, and Honorary Members, who have not previously been corporate members, shall be styled non-corporate members. Non-corporate members shall not be entitled to vote on institute affairs, or to hold office, as an officer of *The Institute*, or as chairman or vice-chairman of a branch, or to vote on branch affairs, except as hereinafter provided. Juniors shall be entitled to vote on branch affairs, and to hold branch offices other than those of chairman or vice-chairman."

Section 4:— **Title**

Change words "Associate" to "Affiliate" in the second and last lines.

Section 5:—**Resident and Non-resident Members**

Change to read:—

"Corporate and non-corporate members residing within Canada and not more than twenty-five miles from the headquarters of a Branch, shall be styled branch residents. Those residing within Canada, but beyond twenty-five miles of a branch headquarters, shall be styled branch non-residents. Those residing outside of Canada shall be styled non-residents."

Section 6:— No change.

Section 7:— **Members**

Change first line to read:—

"A Member shall be at least thirty-five years of age and"

Section 8:— **Associate Members**

Change "twenty-five years of age" to read "twenty-seven years of age" in the first line, and "twenty-eight years of age" to "twenty-seven years of age" in the last line of the first clause.

Sections 9 and 10:— No change.

Section 11:— **Associates**

Change heading to "Affiliates", and in the first line "Associate" to "Affiliate".

Officers

Section 12:—
Change to read:—

"The officers of *The Institute* shall be a president, five vice-presidents, one councillor from each branch having less than two hundred corporate members, two councillors from each branch having two hundred and less than four hundred corporate members, and three councillors from each branch having four hundred or more corporate members."

Section 13:— **Term of Office-Vacancies**

Change clause one to read:—

"The term of office of the president shall be one year, of the vice-presidents two years and of the councillors one year, except in the case of councillors from branches of over two hundred corporate members. The term of office for such councillors shall be two years for those representing branches having a corporate membership of two hundred and less than four hundred, and three years for those representing branches having a corporate membership of over four hundred, one councillor to be elected each year from each branch."

Note for the Ballot:—
"For the first election of councillors under this by-law, elections shall be held only as necessary to maintain the provisions of this by-law allowing the councillors in office to complete their term."

Clauses two and three, no change.

Clause four:—

Add after the word "Councillor" in the second line the words "from the zone in which the vacancy occurs".

Change last clause to read:—

"A vacancy in the office of councillor shall be filled until the following annual election by a corporate member chosen by the council from a list of nominees submitted by the executive of the branch concerned."

Sections 14 to 25, inclusive, no change.

Section 26:— Delete entire section.

Note:—Renumber all following sections to allow for deletion of section 26, and renumber other sections in the interests of uniformity.

Sections 27 to 32, inclusive, no change.

Fees

Section 33:— **Entrance Fees**
Change the word "Associates" to "Affiliates" and the entrance fee of Affiliates from $15.00 to $10.00.

Section 34:— **Annual Fees**
Change the words "Associates" to "Affiliates" in the three places and the annual fee of "Affiliates" from $13.00 to $10.00 in each case.
Add the words "Montreal Branch" after the word "by" in the first line, and add the words "all other" after the word "by" in the eighth line.

Sections 35 to 37, no change.

Section 38:— **Arrears-Exemptions-Retired List**
Change words "Retired List" to "Life Membership List" in the title and in the last line of clause three. In clause three, add after "thirty-years" in fourth line the words "or who has rendered signal service to *The Institute*."

Sections 39 to 49, inclusive, no change.

Section 50:— **Branch Membership**
Change to read:—

"The membership of a branch shall consist of the members of *The Institute* of all classes residing within a distance of twenty-five miles from the headquarters of the branch and the members of all classes residing within an area so allocated that such members are members of the branch most convenient geographically, branch districts to be so apportioned that all members of all classes resident within the Dominion shall be members of a branch. The boundaries of the branch districts shall be determined by the council.

A non-resident member shall have the right to designate himself a member of any branch he may choose, failing which designation he shall be attached, for Institute voting purposes only, to the Montreal Branch.

Branches may at their option admit to branch privileges persons not members of *The Institute*, which persons shall be styled "Branch Affiliates." The qualifications, fees and privileges, of Branch Affiliates, shall be such as may be specified by branch by-laws."

Sections 51 to 56, inclusive, no change.

Section 57:— **Revenue**
Change to read:—

"The secretary of *The Institute* shall each year remit to each branch a rebate of the annual fees, current or arrears, received from the members of that branch during that year, payments being made quarterly, as follows:— Thirty per cent to all branches having a corporate membership of less than one hundred; twenty-five per cent to all branches having a corporate membership of one hundred and less than two hundred; and twenty per cent to all branches having a corporate membership of two hundred or more."

Sections 58 to 59, no change.

Provincial Divisions

Section 60:— **Management**
Change to read:—

"Each provincial division shall be managed by an executive committee consisting of (a) those members of council resident within the division, (b) one representative to be appointed by the executive of each branch of the division, (c) the officers of the division, (d) the past-chairman and the past secretary-treasurer for the year following their term of office."

Sections 61 to 64, inclusive, no change.

Nominations and Elections of Officers

Section 65:— **Electoral Districts**
Change to read:—

"For the purpose of the nomination and election of officers the membership of *The Institute* shall be divided into branch districts for the election of councillors, and zones for the election of vice-presidents. The branch districts shall be determined by the council. The four vice-presidential zones shall be (a) the four western provinces, (b) the province of Ontario, (c) the province of Quebec, and (d) the Maritime provinces."

Section 66:— **List of Members**
Change to read:—

"Council may direct that a list of members with the names arranged alphabetically and geographically, indicating the zones and branches, be sent to corporate members each year not later than August first."

Section 67:— **Election of Nominating Committee**
Change to read:—

"The nomination of officers of *The Institute* shall be made by a nominating committee. The honorary councillors shall be ex-officio members of this committee. The remaining members who shall not be officers of *The Institute*, shall be elected annually as follows:—Each branch shall appoint one member, an additional member appointed by the council shall be chairman of the committee. The membership of the committee shall be announced at the annual general meeting."

Section 68:—**Nominating Committee to Prepare Officers Ballot**
Clause one, no change.

Clause two:—
Change to read:—

"A vice-president shall be elected by vote of the corporate members resident within the zone for which he is a candidate, an election to take place every two years in each zone, except in zone (c) where an election shall take place each year. One vice-president shall be elected from each zone, except zone (c) from which two vice-presidents shall be elected, one of whom must be resident within twenty-five miles of the headquarters of *The Institute*."

Clause three:—
Change to read:—

"A councillor shall be elected by vote of the corporate members resident within the branch district for which he is a candidate."

Clauses four and five, no change.

Note for the first ballot under this by-law:—

"For the first election of vice-presidents under this by-law, elections shall be held only as necessary to maintain the provisions of this by-law allowing the vice-presidents in office to complete their term."

Clauses under "Nominees for Officers Ballot sent to Members" and "By-laws", no change.

The Officers' Ballot

Clause one:—

Change the word "District" in the third line, to "zone or branch district", and the word "Districts" in the fifth line, to "zones and branches."

Clause two:—

Change the tenth word in the fourth line "Councillors" to "councillor" and the word "District" to "branch" in the fifth line.

The balance of the by-laws;— no change.

New Honorary Member

Entrance to the classification of honorary membership in *The Institute* has always been closely guarded in order that the high standard be maintained. When a non-member is made an honorary member it is in recognition of the high place he occupies in national or educational affairs. When an engineer is admitted to this distinction it is one of the greatest tributes that can be paid him by his fellow engineers, and is an acknowledgement of the high position he occupies in the profession, both professionally and in virtue of the services he has rendered.

It is fitting therefore, that C. E. W. Dodwell, B.A., M.E.I.C., should be chosen to be admitted to this select coterie. On Tuesday, November twenty-first, nineteen twenty-two, Mr. Dodwell, one of the prime movers in the establishment of the Canadian Society of Civil Engineers, the father of engineering legislation in Canada, and at all times a capable and active worker on behalf of the profession, was unanimously elected to honorary membership in *The Institute*. Mr. Dodwell is one of the best known and most highly respected engineers in Canada, and in conferring this tribute of respect and esteem upon him by the Council, it was felt that by so doing another distinguished name is being added to those already on the list.

PERSONALS

D. W. Hays, M.E.I.C., has opened an office in the Herald Building, Calgary, consulting in irrigation work.

M. A. Sammett, A.M.E.I.C., of Montreal, has left for an extended trip on account of ill health. His practice has been taken over by J. A. Burnett, M.E.I.C.

H. G. Wellsford, A.M.E.I.C., has been transferred from the Dominion Bridge Company, Limited, Winnipeg, to the Montreal office of the same company.

H. J. MacKenzie, M.E.I.C., is now with the Nova Scotia Provincial Highways Board as construction engineer at Monastery, Antigonish county.

S. K. Payzant, Jr.E.I.C., who received his degree of B.SC., from Acadia University in 1914, is now located at Talara, Peru, South America.

Spencer Ball, Jr.E.I.C., who received his degree of B.Sc., from the University of Saskatchewan, in 1916, has accepted a position with the sewer section of the works department of the city of Toronto.

Stephen Williams, S.E.I.C., has accepted a position with the Imperial Oil Company at Sarnia, in their draughting department. Mr. Williams is a graduate of Royal Military College, Kingston.

Grant S. Sherman, A.M.E.I.C., has accepted a position on the engineering staff of the National Aniline and Chemical Company of Marcus Hook, Pa., and is located at Wilmington, Del.

M. D. Ross, S.E.I.C., of Chatham, Ontario, who graduated this year in electrical engineering from the University of Toronto, is now connected with the Westinghouse Company at East Pittsburg, Pa.

Donald H. Macfarlane, Jr.E.I.C., who graduated from McGill University, in 1921, has accepted a position as draughtsman and associated with H. A. Budden, A.E.I.C., advocate and council in trade mark and patent cases, of Montreal.

J. Aggiman, A.M.E.I.C., has charge of the construction and manufacturing department of the Standard Oil Company for the Near East, being stationed at Constantinople. Mr. Aggiman received his degree of B.Sc., from McGill University, in 1917.

H. E. Mott, S.E.I.C., who received his degree of B.Sc., in electrical engineering from McGill University this year, has accepted the position as engineer in charge of the testing department of Marconi Wireless Telegraph Company of Canada Limited, at Montreal.

H. S. Bare, A.M.E.I.C., who for a number of years was with the Canadian Pacific Railway, as resident engineer of the Angus shops, and resident engineer of the Montreal terminals, and building engineer in charge of construction of the Angus shops, is now located with the Gurney Scale Company, Montreal.

D. G. Calvert, A.M.E.I.C., is resident manager and treasurer of the Fort William Paper Company, Limited, having charge of the operation of the company's large groundwood mill and construction department, which is just completing a two machine newsprint mill. M. Turner, A.M.E.I.C., is construction superintendent for fhe company.

L. W. Lester, A.M.E.I.C., is now assistant engineer with Charles Hawley and Company on a hydro-electric construction project on the Clarion river in Pennsylvania. Before leaving for Clarion, Mr. Lester was connected with the Manitoba Power Commission as surveying engineer.

C. H. M. Burns, A.M.E.I.C., formerly chief engineer with the Maritime Coal Railway and Power Company, and who is now mining engineer specializing on the mechanical equipment of mines and the preparation of coal, in Philadelphia, has been elected a member of the American Society of Mechanical Engineers.

J. G. Lennox, A.M.E.I.C., has accepted a position with Fetherstonhaugh and Company, Montreal. Mr. Lennox has had considerable experience in the design and erection of mechanical, electrical and structural work in Glasgow and in design and estimating, with the mechanical department of the Dominion Bridge Company, Lachine.

A. A. Turnbull, Jr.E.I.C., is with the New Brunswick Telephone Company at St. John, N.B. Mr. Turnbull was attending Dalhousie University when war was declared and returned to complete his course after three years on active service, during which time he served as Lieutenant in the 4th Battalion, Canadian Machine Gun Corps.

A. R. Hannaford, A.M.E.I.C., has accepted a position as office and designing engineer with the city engineer's department, Hamilton, Ontario. On coming to Canada from England some twelve years ago, Mr. Hannaford joined the engineering staff of the Grand Trunk Railway and continued on various works with the railway, until accepting his present position.

J. F. Lumsden, A.M.E.I.C., has accepted a position with the Nova Scotia Power Commission. Mr. Lumsden received his degree of B.Sc. in electrical engineering from the Nova Scotia Technical College in 1911. Prior to accepting this position Mr. Lumsden was professor in electrical engineering in the Nova Scotia Technical College.

Oswald Milne, S.E.I.C., who has had varied experience in the draughting departments of the British American Shipbuilding Company, and the Canada Steel Foundries Limited of Welland, and later had complete charge of design and draughting work for P. Payette Company, Penetanguishene, has accepted a position on the engineering staff of the Waterous Engine Works Company, Limited, at Brantford, Ont.

G. F. Alberga, Jr.E.I.C., who graduated from McGill University with the degree of B.Sc., is now superintendent of parochial roads and works, May Pen P.O., Jamaica, B.W.I. Before leaving for Jamaica, Mr. Alberga had been connected with the bridge department, Canadian Pacific Railway, Montreal, and more recently on the staff of the mechanical engineering department of McGill University.

J. A. Burnett, M.E.I.C., consulting and appraisal engineer, has taken over the office of M. A. Sammett, A.M.E.I.C. Mr. Burnett has had a wide experience with the Royal Electric Company, Canadian General Electric Company; construction of a large sub-station for the Montreal, Light Heat and Power Company; construction of the Montreal and Southern Counties Railway, and the appraisal of all the electrical equipment on the Grand Trunk System for the Government arbitration.

W. H. Snelson, A.M.E.I.C., of the Calgary Branch, has prepared a bulletin, which has been recently issued by the Reclamation Service, dealing with irrigation practice and water requirements for crops in Alberta. While intended primarily for the instruction of farmers on irrigated lands it is of interest to engineers engaged in irrigation work in that it visualizes the processes needful after construction of canals is finished, and gives authentic data on the quantity of water that can be used to advantage in producing crops in this climate.

Geo. R. Pratt, A.M.E.I.C., fuel engineer for the province of Alberta is the author of a particularly interesting booklet entitled "Coal Truths" which has recently been published by the Coal Truth office of the Mines Branch of the province of Alberta. While primarily designed to be of service to the domestic user of Alberta soft coals, it contains much of interest to all users of coal. The text is so written that it may be understood by all and is well illustrated with a large number of plates many of which are in colours.

R. L. Hearn, A.M.E.I.C., is now assistant chief engineer with the Washington Water Power Company, Spokane, Washington. After graduating from the University of Toronto in 1913 with the degree of B.A.Sc., Mr. Hearn was with the Dominion Bridge Company, Limited, at Lachine, as draughtsman, and later with the Hydro-Electric Power Commission of Ontario, as designer on Wasdells Falls power development. On the Eugenia Falls development, he was shop inspector for steel penstock and surge tank, and was assistant engineer on design, charge of designing and draughting, on the Queenston-Chippawa development.

Thomas Taylor, M.E.I.C., is now engineer of railway and bridges with the Department of Works of the city of Toronto. After graduating with honours from the School of Practical Science, University of Toronto, in 1902, Mr. Taylor was for a number of years engaged on structural steel work, detailing, designing and estimating with the Riter Conley Construction Company in Pittsburg, Pa.; the McClintic-Marshall Construction Company; and the Canada Foundry Company. Mr. Taylor joined the engineering staff of the city of Toronto in 1912 and was connected with the construction of the Bloor street viaduct from the time of the preliminary surveys, in the capacity of designing and construction engineer.

Frederick H. Moody, Jr.E.I.C., who graduated with the degree of B.A.Sc. in mechanical engineering, from the University of Toronto, has been elected president of the Canadian Electrical Equipment Company, Limited, which company is the sole Canadian representative for the Valley Electric Company, and also representatives for the Towmotor Company, and the Cleveland Crane and

Engineering Company of Cleveland, Ohio. Following graduation, Mr. Moody had considerable experience in editorial work being associate editor of the "Canadian Machinery" and "Power House", in 1910, and of "Machinery", New York, in 1911, and mechanical and engineering editor of the "Railway and Marine World" for following year.

H. Alton Wilson, A.M.E.I.C., until recently technical editor with the McLean Publishing Company in Montreal, has been appointed managing editor of the Daily Intelligencer at Belleville, Ontario. Mr. Wilson is a graduate in mechanical and electrical engineering of the University of Toronto, 1911, and was for a number of years engineer for the J. C. Wilson and Company, Glenora, Ont., engaged in the manufacture of turbines and power transmission machinery. During the war Mr. Wilson was engineer and manager in charge of a munition factory at Belleville, Ont., manufacturing high explosive shells and subsequently was appointed equipment engineer for the North East Electric Company, at Rochester, New York.

J. L. Busfield, M.E.I.C., formerly secretary-treasurer of the Montreal Branch, has entered into partnership with de Gaspé Beaubien, M.E.I.C., and is engaged in general consulting engineering practice under the name of Beaubien, Busfield and Company, with headquarters in Montreal. Mr. Busfield has had extensive experience in railway engineering and hydro-electric development, having been for several years assistant engineer with the Mount Royal Tunnel and Terminal Company, and for the past five years, principal assistant to Walter J. Francis and Company, of Montreal, in charge of various power investigations, valuations and construction. Mr. Busfield is at present in Winnipeg, on work for the Manitoba Power Company.

J. J. Hanna, A.M.E.I.C., is now engaged on the construction of an oil refinery for the Imperial Oil Company at Calgary. Prior to accepting this position Mr. Hanna was with the Lethbridge Northern Irrigation district. Mr. Hanna graduated in 1914 from the University of Toronto with the degree of B.A.Sc., and was with the Canadian Pacific Railway as assistant engineer of the hotel department with supervision of operation and maintenance, and charge of all surveying and draughting for hotel grounds through the Rocky mountains, and also supervision of construction and maintenance of mountain trails. In May 1914 he was appointed as assistant in the roadway department of the city engineer's office at Calgary, from which position he resigned in August of the same year to go overseas.

W. D. Adams, A.M.E.I.C., has severed his connection as assistant engineer with the Toronto Transportation Commission and is now employed with Walter J. Francis and Company, in Toronto. After graduating from the Royal Military College, Kingston, in 1908, he was appointed assistant engineer, middle division of the Grand Trunk Railway. In 1910, he was in charge of the engineering department of the Canadian Buffalo Forge Company, Montreal, and, from June of that year until August 1914, he was assistant engineer, grade separation, railway and bridge section of the Department of Works of the city of Toronto. On returning from overseas in September 1919, he became a partner with Adams Brothers of Toronto until he joined the staff of the Toronto Transportation Commission in January 1921.

T. D. Mylrea, A.M.E.I.C., has been appointed assistant professor in structural engineering, University of Illinois. After graduating from the University of Illinois in 1909 with the degree of B.Sc. in civil engineering, Mr. Mylrea was engaged with the American Bridge Company as draughtsman and checker. Later he was checker and then chief draughtsman with the Winnipeg plant of the Dominion Bridge Company; designer with Harkness and Oxley; science master with Ingersoll Collegiate Institute; and engineer of tests, Toronto City Architect's department, and while with the City Architect's department Mr. Mylrea made an extensive study of the effects of fire upon the concrete building of the Quaker Oats Company's plant. More recently he has been with the Toronto office of the Trussed Concrete Steel Company as chief engineer, and later engineer with Norman McLeod, Limited, Toronto.

Appointed Industrial Lecturer, University of British Columbia.

MAJOR GEORGE A. WALKEM, B. Sc. M.E.I.C.

Major George A. Walkem, B.Sc., M.E.I.C., has been appointed lecturer in industrial management on the staff of the department of mechanical engineering at the University of British Columbia. As pointed out by president L. S. Klinck, Major Walkem is the first to volunteer to give his services for any extended period free of charge to the university and in this connection President Klinck alluded to the fact that Major Walkem's father had been a well-known lecturer at Queen's University, Kingston, Ont.

Major Walkem who was elected Councillor this year has been an active member of *The Institute* since 1906. His long experience in consulting mechanical

engineering and as the head of prominent engineering and equipment companies on the Pacific coast, makes his services under his new appointment of special value to the university.

Secretary of Association of Professional Engineers of Ontario.

R. B. Wolsey who was appointed secretary-treasurer and registrar of the Association of Professional Engineers of the Province of Ontario has been for some weeks actively engaged in the work of registration of engineers from all parts of the province, with headquarters at the Engineers Club, Toronto.

R. B. WOLSEY

Mr. Wolsey is prepared to give the fullest information regarding the new association to all inquirers, and the association is fortunate in having available at the outset the experience gained by him in his capacity as secretary, treasurer and acting registrar of the Ontario Association of Architects during the past nine years, and as secretary of the Engineers Club of Toronto.

Mr. Wolsey was born in England and received his early education at Dereham and Argyll College, London, and his engineering training in the office of Mr. Martin, a noted engineer and architect of Westminster. Since coming to Canada thirty-one years ago Mr. Wolsey has been connected with the Cleveland Electric Railway, Goodrich Rubber Company, Morgan Engineering Company, United Electric Company and Canada Foundry Company.

Trade Publication

Canadian Link-Belt Company Ltd. A four page circular letter, advertising the publication of their new general catalog No. 400 has been received by us from Canadian Link-Belt Company. This circular carries a letter on the first page suggesting that engineers, superintendents and purchasing agents send for a copy, and provision is made on the last page for eight separate requests. The two inside pages are devoted to an illustration of the catalog, and as this illustration is in colors, the effect is novel and striking. Requests for this catalogue should be addressed to the company either in Toronto or Montreal.

EMPLOYMENT BUREAU

AND MEMBERS' EXCHANGE

To make this department more valuable it is proposed that in future advertisements of situations vacant should state salary, and give details of requirements.

Situations Wanted

Civil Engineer

Civil engineer, 1922 graduate, three seasons experience on survey work, desires position, preferably water power development. Salary not governing feature provided there is opportunity of advancement. Available now. Apply Box No. 124-P.

Mechanical Engineer

Mechanical engineer desires permanent position, 20 years experience including supervision of erection, operation and repairs of large gas engines and oil engines, gas producers, steam turbines and general engineering work; have also a fair knowledge of selling. Available to take charge of any undertaking where my experience will be of mutual advantage. Apply Box No. 125-P.

Industrial Engineer

Graduate in Arts and Science. General experience in design and construction of mill buildings. Thoroughly experienced in maintenance and repair work, and testing of equipment, as applied in modern paper mill practise. Open for engagement. Apply Box No. 126-P.

Mechanical Engineer

Mechanical engineer, A.M.E.I.C., age 32 years, married, fourteen years experience in marine engineering, desires responsible position with firm of consulting engineers either marine or steam power plant. Have experience in management and repair of high powered reciprocating and turbine engines, also Diesel engines, water-tube and tank boilers of all sizes, oil fuel and coal burners. Eight years in responsible position with rank of Engineering Lieutenant in R.C.N. Apply Box No. 127-P.

Situation Vacant

Engineering Salesman

British instrument firm requests applications for position of travelling engineering salesman. Must have knowledge of power plant instruments also civil engineering and draughting requisites. Young unmarried man of good personality. State full qualifications and experience also salary desired. Apply Box No. 219.

Assistant Chemist

An Assistant Chemist in the Foods and Drugs Division of the Department of Health at Ottawa, at an initial salary of $2,100 per annum, which will be increased upon recommendation for efficient service at the rate of $120 per annum, until a maximum of $2,580 has been reached. This salary will be supplemented by whatever bonus may be provided by law.

Duties.—Under supervision, to make chemical analyses and physical examinations of substances; analyzing foodstuffs and drugs; determining the nutritive value of foods; following prescribed methods of analysis not requiring extreme accuracy, and to perform other related work so assigned.

Qualifications.—Education equivalent to graduation from a university of recognized standing with special training in analytical chemistry; preferably one year of laboratory experience.

Examination.—Rating on Education and Experience, from the sworn statements submitted by applicants on their application forms, Weight 5; Oral Examination, if necessary, Weight 5.

Application forms properly filled in must be filed in the office of the Civil Service Commission *not later than December 14.* Application forms may be obtained from the offices of the Employment Service of Canada, from the Postmasters at Prince Rupert, Vancouver, Victoria, Edmonton, Calgary, Regina, Winnipeg, Quebec, Charlottetown, Halifax, Fredericton, and St. John, or from the Secretary of the Civil Service Commission.

By Order of the Commission.

W. FORAN, *Secretary.*

Members' Exchange

Cook Transit, 1896, overhauled at Cook's Works, York, England in 1910. 5 inch horizontal circle divided to 30 seconds. 5 inch verticle circle divided to 30 seconds. Single opposite verniers at right angles to line of sight. 3 level adjustment; 1¼ inch aperture; trough compass with tripod, price $100. Box No. 27-A.

Publications

Practical Accounting for General Contractors:—A text book for the accounting systems of contracting organizations, by H. D. Grant, of the staff of W. B. Richards and Company, accountants and engineers, has been recently published by McGraw-Hill Book Company, Inc., New York. While every accounting system, to be successful, must be adapted in its details to the particular conditions existing, this book sets forth principles and basic records which govern the keeping of accounts for general contractors. The book is divided into three parts; first, financial accounting, with chapters describing various types of contracts, financial accounts and records to be kept, and the preparation of financial statements, — second, field accounting control, giving details of cost accounts, the field accounting organization and personnel, the method of handling accounts and necessary records, and the preparation of the monthly report, — and third, miscellaneous matters in which are discussed payroll problems, control of equipment, preparation of estimates and bids, municipal contracts and legal aspects of contracts.

Theory of Wave Transmission. — A treatise on transmission of power by vibrations, by George Constantinesco, the second (revised) edition of which has been published by Walter Haddon, 132, Salisbury Square, London, E.C. 4, proprietor of patents controlling wave transmission. Commencing with a statement of the elementary principles involved, and definitions of the various parts of the system, the book deals at some length with the theory of transmitting power by means of vibration of the medium employed, whether solid, liquid or gaseous. According to the new system, energy is transmitted from one point to another, which may be at a considerable distance, by means of impressed periodic variations of pressure or tension producing longitudinal vibrations in solid, liquid or gaseous columns. A chapter is devoted to the principles of the motors developed for use in connection with the system, while the various other apparatus, required for the system, such as, condensers, inertias, leakage devices, and transformers, are also fully dealth with.

ELECTIONS AND TRANSFERS

At the meeting of Council held on November 21st, 1922, the following elections and transfers were effected:—

Members

CHRISTIE, William, B.A.Sc., (Univ. of Toronto), surveyor engr., Topographical Surveys Branch, Department of the Interior, Ottawa, Ont.

SOUBA, William Henry, M.E. (Minnesota Univ.), partner, C. D. Howe and Company, consulting engineers, Port Arthur, Ont.

Associate Members

BONNELL, Mossom Burwell, B.A.Sc. (Univ. of Toronto), examiner in chg. of divn. of elec'l. apparatus, Canadian Patent Office, Ottawa, Ont.

DUNLAP, Henry Joseph, B.Sc. (Queen's Univ.), asst. magnetician, Topographical Surveys Branch, Department of the Interior, Ottawa, Ont.

FREELAND, Edward Ewing, B.A.Sc. (Univ. of Toronto), topog'r. engr., Topographical Divn., Geological Survey, Dept. of Mines, Ottawa, Ont.

HATTON, Gerald Percy, B.A., B.E. (Royal Univ. of Ireland), engr'g. clerk, levelling office, Topographical Surveys Branch, Department of the Interior, Calgary, Alta.

NIXON, Norman James, B.Sc. (Queen's Univ.), foreman engr. Northern Electric Company, Montreal, Que.

SAUNDERS, Clarion Spencer, general manager, The Shawinigan Engineering Company, Limited, Montreal, Que.

STRAIN, John Walker, building contractor, partner of firm, Strain and Emery, Limited, Windsor, Ont.

Juniors

JOB, Stanley Robert, designing dftsman., H.E.P.C., of Ontario, Welland, Ont.

WARNER, Donald Franklin, S.B., (Mass. Inst. of Tech.), turbine circulator, General Electric Company, West Lynn, Mass.

WHITEHILL, Peter, B.Sc. (C.E.-Univ. of Man.), of 301, Inkster Blvd., Winnipeg, Man.

Transferred from the class of Associate Member to that of Member

BROWN, Arthur Charles, ch. engr., J. P. Porter, Standifer and Porter Bros., contrs., sections 1 and 2, New Welland Ship Canal, St. Catharines, Ont.

DISNEY, Charles P., engr. of bridges, Eastern Lines, C.N.R., Toronto, Ont.

JOHNSTON, Harold Stanley, B.Sc. (McGill Univ.), hydraulic engr., Nova Scotia Power Commission, Halifax, N.S.

JONES, Harold William, B.Sc., (McGill Univ.), Tidal and Current Survey, Department of Marine, Ottawa, Ont.

LAWRENCE, William Dawson, B.Sc. (McGill Univ.), supt. engr., McGill University, Montreal, Qϵe.

Transferred from the class of Junior to that of Associate Member

EMREY, Joseph Desmond, B.Sc. (Queen's Univ.), field supt., Bridge Dept., Canadian Des Moines Steel Company, Ltd., Chatham, Ont.

IRVING, James C., B.C.E. (Univ. of Man.), district engr., Good Roads Board, Winnipeg, Man.

MACKENZIE, Gordon Leslie, B.Sc. (C.E.-Queen's Univ.), associated with J. E. Underwood, consltg. engr., Saskatoon, Sask.

STRATHY, Rolph Lee Alexander, B.Sc. (E.E.-McGill Univ.), testing department, Canadian General Electric Company, Peterborough, Ont.

WHITTIER, Albert Ronald, B.Sc. (Queen's Univ.), asst. to Superintending Engineer, of Rideau Canal, Ottawa, Ont.

Transferred from the class of Student to that of Associate Member

AFFLECK, John Knox, B.A.Sc. (Univ. of Toronto), works chemist, Imperial Varnish and Colour Company, Toronto, Ont.

JOHNSON, G. Alan, B.Sc. (McGill Univ.), factory manager, Robert Mitchell Company, Limited, Montreal, Que.

Transferred from the class of Student to that of Junior

HEENEY, Terrence James Clifford, asst. to cable engr., engr'g. dept., Northern Electric Company, Limited, Montreal, Que.

BRANCH NEWS

Victoria Branch

Horace M. Bigwood, A.M.E.I.C., Secretary.

The initial meeting of the Branch for the year was held on Wednesday, November 8th, at the Branch rooms, 25 Brown building, and was attended by a good number of members.

The meeting was fortunate in having Major Geo. A. Walkem, M.E.I.C., councillor for District No. 10, present to address it on the subject of "Policy". The whole of the ground covered by the report of *The Institute* committee dealing with the subject was very ably reviewed by the speaker, particular points being discussed at length. As the discussion showed, and as several members remarked, the report was but indifferently understood or appreciated by a large majority of *Institute* members, and yet when brought directly to their attention its important bearing towards the membership at large was readily seen.

'Legislation,' the evergreen topic in so far as the Victoria Branch is concerned, was introduced and the probable bearing of the report on possible action of *The Institute* towards co-ordination of existing legislation was discussed, Mr. Philip, the chairman, leading the discussion, and voicing the hope that before very long universal legislation throughout the Dominion with the E.I.C. at least nominally the pivot about which all turned, would be a reality.

Major Walkem spoke of his own various activities in public matters and advocated more interest on the part of engineers as individuals in the sphere of public life. Dominion, provincial and municipal politics were all open to engineers who were willing to take part. Agreement in this view was expressed by another speaker who described the Major as the first self-assertive engineer that he had met.

This being the meeting immediately prior to the annual meeting, which will be held on Wednesday, December 13th, nominations for officers for the coming year were made.

On Monday, December 11th, a lecture on the railway construction work of the Royal Engineers in Palestine will be given under the auspices of the Branch. Considerable difficulty has been experienced in the past in securing papers to be read at meetings of the Branch and it is proposed, when free evenings occur, to try and induce one or more members to read five or ten minute papers dealing with small details of the work upon which they are immediately engaged, or with problems they have met with the method adopted for their solution. It is thought by this means to create interest in meetings, promote discussion and give information without great expenditure of time.

St. John Branch

Harry F. Bennett, A.M.E.I.C., Secretary-Treasurer.

Visit of the General Secretary

The St. John Branch gave the General Secretary a royal welcome on November 6th, and 7th, when he visited St. John on his tour of the Maritime Provinces. Owing to November 6th, being a holiday, no definite programme was arranged and Mr. Keith spend the day among friends in the city. On Tuesday, November 7th, F. M. Ross, Affiliate of the St. John Branch, general manager of the St. John Dry Dock and Shipbuilding Company, Ltd., invited the engineering staffs of the Dominion Public Works Department to lunch with Mr. Keith at Courtenay Bay. Before luncheon, the party visited the suction dredge "Tornado", at work in the new harbour and the advantages of the oil burning equipment which has recently been installed were pointed out. The party was greatly impressed with the apparent efficiency of the plant which has a record for twenty-two days of 329,000 cubic yards removed.

About thirty-six engineers and other guests sat down to lunch in the company's dining hall and rapidly devoured the splendid food presented for their approval. Alex. Gray, M.E.I.C., engineer in charge of St. John harbour, expressed the sentiments of the gathering when he thanked Mr. Ross for his hospitality. He explained that no expense had been spared in making this dry dock second to none on the North American continent. He was very glad that the engineers of the department had this opportunity of seeing the work being done. Fraser S. Keith, M.E.I.C., expressed his pleasure at being present at such a happy gathering. He felt that greater interest was being taken in this work in Montreal than in St. John, and he hoped that on completion a large gathering of engineers might take place at the formal opening. He wished the company every success in its undertaking.

F. M. Ross said he was pleased to have the engineers as the guests of the company at this time and he knew that they would all be satisfied after the inspection of the works that St. John was going to have a dock of which any country should be proud. They had met difficulties, many of them, but they had been overcome and he was proud of the work accomplished by the engineers with whom he was associated.

The party made a tour of the dock and accessory plant and those who had not had the opportunity of visiting the work recently were amazed at the progress. The dock itself, which will have a total length of 1,150 feet, is divided into two small docks, the outer of which is nearing completion. The steel for the caisson at the entrance is now being assembled. Work is progressing on the waiting and fitting-out berths at the entrance. It is hoped that a full description of this magnificient dry dock will be available for publication in *The Journal* early in the new year. In addition to the dry dock, a marine railway is to be erected on the north side of the dock, capable of handling small craft up to 2,000 tons.

Complimentary Dinner

On the evening of November 7th, the Branch gave a complimentary dinner to Fraser S. Keith, at which forty-four members and guests sat down to a splendid repast at Bond's restaurant.

After the toast to the King, Frank P. Vaughan, M.E.I.C., proposed a toast to the E.I.C., to which C. C. Kirby, M.E.I.C., replied. Mr. Kirby dwelt on the aims of *The Institute*, its endeavours to promote legislation for the benefit of engineers generally, and its policy for the

future. He also took up the work of the local Branch and pointed out its opportunities for service. A. G. Tapley, A.M.E.I.C., chairman of the gathering, proposed a toast to the General Secretary, which all present drank most enthusiastically to the accompaniment of musical honours.

In replying to the toast Mr. Keith said he was overwhelmed by the enthusiastic reception he had received in the city, he was having a wonderful time and would return to Montreal assured that the E.I.C., was held in high regard in these provinces. He then took up the several items in the report of the Committee on Policy and that on Classification and Remuneration. In a forceful manner he impressed the members with the progress being made along lines of vital interest to all. The close attention paid to the speech and the applause at its conclusion showed that his work and that of *The Institute* generally, was appreciated.

Various musical numbers were interspersed among the speech and all combining to make the event an enjoyable one.

The St. John Branch began its winter programme on Thursday, October 19th, when the members had the opportunity of hearing J. A. Coderre, of the Forest Products Laboratories, Montreal, speak on "Preservation of Timber from Marine Borers". A. G. Tapley, A.M.E.I.C., was in the chair, and before the paper various matters pertaining to the work of the Branch were discussed; the Branch endorsed the suggestion of the Committee on Policy to pay the expenses of the Councillors to one Council Meeting.

St. John Branch visits new Dry Dock, November 7th, 1922

1 E. A. Thomas; 2 V. S. Chestnut; 3 E. G. Cameron; 4 J. M. Lamb; 5 F. M. Barnes; 6 B. Allen; 7 W. C. Ewing; 8 G. Stead; 9 F. M. Ross; 10 G. E. Martin; 11 A. G Tapley; 12 G. H. Thurber; 13 F. G. Goodspeed; 14. W. J. Johnston; 15 H. R. Logie; J. H. McKinney; 17 S. H. Vaughan; 18 A. Gray; 19 H. D Macauley; 20 C. S. Bennett; 21 W. V. Delaney; 22 A. A. Dodge; 23 F. P. Vaughan; 24 F. S. Keith.

Mr. Coderre, with the aid of lantern slides, described the physical characteristics of the various marine borers. He showed how the mollusc bored into the wood and still received its food from the surrounding waters. The boring action was apparently the means it had of maintaining a home and the wood was not used as a food. The crustaceans, however, are very small in comparison to the molluscs, but bore to a considerable distance into the wood and use it as a food.

Mr. Coderre explained that the Forest Products laboratories had experimented with the various woods available, and with various methods of treatment in order to develop means of overcoming the action of marine borers. It had been found that creosoting, either by the pressure or open tank treatments would prevent the borers from destroying the wood. The great difficulty experienced was the necessity of fashioning the timbers after leaving the creosoting plant, and the smallest opening into the untreated wood would afford sufficient opportunity for the pests to establish themselves. There appeared to be but one way of overcoming this difficulty and that was by the establishment of creosoting plants near the localities where such timber was needed.

Experiments with various timbers had shown that spruce and hemlock, which are the principal construction timbers in the Maritime Provinces, would not take sufficient creosote to form a perfect seal against the borers. The structure of the wood itself was the cause of this and it would be necessary to use different native woods if creosoting was undertaken. The jack pine, also called princess pine, is a good structural timber and will take a large percentage of creosote. Birch and poplar could also be used with satisfaction. If round timber is to be treated, care must be taken that every particle of bark is removed, as the creosote would not penetrate through the bark. To obtain ideal conditions it is necessary to treat all timber after the framing and boring for bolts is completed; then it is possible to have a material proof against the ravages of marine borers.

At the conclusion of the paper numerous questions relating to the subject of marine borers and creosoting were asked, especially concerning the local conditions and structures. A vote of thanks was tendered the speaker by the chairman.

The regular meeting of the Branch was held on November 16th. Geoffrey Stead, M.E.I.C., district engineer of the Dominion Public Works Department, addressed the meeting on "Richibucto Cape Breakwater". A. G. Tapley, A.M.E.I.C., was in the chair, and a large number of members were present.

Mr. Stead described the general conditions of the northern coast of New Brunswick, its continually shifting sand bars, and the difficult task involved in maintaining harbours which are greatly needed in order that the fishermen may have half a chance to obtain a livelihood. He explained how in a number of cases, and especially at Richibucto cape, which is close to a splendid fishing ground, the improvement of harbours had greatly benefited the fishing industry.

At Richibucto cape no natural harbour existed, and it was necessary to form a sheltered basin within the confines of two piers. Work was started in 1908 and

has continued, at intervals, to date when it is about completed. As the work progressed, the shifting sands filled in, and when the basin was completed it was practically filled to low water with sand. Dredging was resorted to and since then there has been no great difficulty in maintaining a harbour with sufficient depth to protect the shoal draught fishing fleet within its area. Mr. Stead pointed out the lessons learned as the work progressed and the methods adopted in overcoming difficulties which arose. At the conclusion of the paper many interesting questions were asked by the various members.

A vote of thanks to Mr. Stead was moved by H. F. Bennett, A.M.E.I.C., seconded by F. G. Goodspeed, M.E.I.C.

A resolution moved by F. G. Goodspeed, M.E.I.C., and seconded by C. S. Bennett, Jr.E.I.C., was adopted, protesting against the practice of bringing alien engineers into Canada on consulting work, when thoroughly competent Canadians are available.

A resolution endorsing the report of the Remuneration and Classification Committee, as published in the November *Journal*, was adopted.

Hamilton Branch

W. F. McLaren, M.E.I.C., Secretary-Treasurer.

On November 1st, a joint meeting was held with the Hamilton Chapter of the Ontario Society of Architects at the Royal Connaught hotel. Brigadier General C. H. Mitchell, D.S.O., M.E.I.C., Dean of the Faculty of Applied Science, University of Toronto, and Lt.-Col. L. W. Gill, the new principal of the technical school in Hamilton, were guests of the executive at dinner previous to the lecture on Italy.

Brigadier-General Mitchell, who is an old Hamilton boy, was on Lord Cavan's staff in charge of the British Intelligence Department in Italy during the war, and his lecture was illustrated with views from his private collection of slides. The speaker outlined in a comprehensive manner the Italian campaign in the Alps from 1917 to the armistice. The precautions taken by the Italians to preserve their works of art in Venice and other important centers, were dealt with by the speaker, who also described the difficulties encountered by the Italian and British troops in mountain fighting. Engineering problems, such as tunnels, bridges and cliff galleries were discussed with the engineers. At the close of the lecture Stewart McPhie, chairman of the architects, moved a vote of thanks, which was seconded by F. W. Paulin, A.M.E.I.C. of the engineers, and heartily applauded.

The interest shown in the lecture was indicated by the attendance which exceeded one hundred.

London Branch

F. J. Bridges, A.M.E.I.C., Secretary-Treasurer.
R. I. Olmsted, A.M.E.I.C., Branch News Editor.

Regular Meeting, Oct. 18th

A regular meeting of the London Branch was held on the evening of October 18th in the Board Room of the Public Utilities Commission. After the transaction of general business arising from the minutes of the previous meeting the chairman, H. A. Brazier, M.E.I.C., called upon H. B. R. Craig, to tell the members what he knew regarding the Association of Professional Engineers of Ontario. This was followed by a paper, prepared and read by H. A. Brazier, city engineer of London, on the several points of engineering interest in the city, which were inspected by the members of the Branch on the afternoon of October 7th. At the close of this most interesting and well thought out paper, a vote of thanks on motion of Messrs. Angus and Farncomb was unanimously passed and the meeting was adjourned.

Special Meeting

A special meeting of the London Branch was held in the private dining room of the Blue Dragon Tea Room, Dundas St., on Tuesday evening, October 24th, in which dinner was served to some twenty-seven members. K. M. Cameron, M.E.I.C., chairman of the Ottawa Branch and assistant chief engineer of the Department of Public Works of Canada being the guest of honor, H. A. Brazier, M.E.I.C., presiding.

Mr. Cameron, in his address to the members, outlined the Ottawa Branch activities, and explained how their success had been achieved, outlining especially the information which can be obtained by the use of moving picture films available through the Dominion Government Publicity Bureau. Mr. Cameron's address proved most interesting and many points brought out will be of use to the local Branch. At the conclusion of the address a hearty vote of thanks was tendered the speaker.

Lieut. Col. W. J. Brown, executive secretary Western University, London, also Officer Commanding 7th Brigade Canadian Field Artillery, then spoke for a few minutes on the organization of the 7th Field Company, Canadian Engineers, making an appeal to all engineer officers present to assist in this organization which, he stated, had so far proved unsuccessful. The chairman, on behalf of the London Branch, promised Lieut.-Col. Brown the assistance called for, and suggested the appointment of a committee to investigate. This latter point, however, was left to be taken up at an early date.

Cape Breton Branch

Kenneth G. Cameron, A.M.E.I.C., Secretary-Treasurer.

On Tuesday, October 31st, our general secretary, Fraser S. Keith, M.E.I.C., paid a visit to Sydney and was sincerely welcomed by all members. There being no other branches in the near vicinity the visit helped to dispel that feeling of "splendid isolation" which is apt to take possession of us. At 4.30 in the afternoon Mr. Keith addressed a gathering of members in the Dominion Coal Company club house, at Glace Bay, the chairman, C. M. Odell, M.E.I.C., presiding. Mr. Keith's address dealt principally with the recommendations of the Committee on Policy and the steps being taken by Council to put same into effect. Some varying views were expressed during a short discussion on the report of the Committee on Classification and Remuneration, which brought out a few of the difficulties liable to be encountered and drew the attention of members to the necessity of careful consideration of this whole matter. Mr. Keith also outlined the procedure followed in handling *The Institute's*

employment bureau, a matter of great interest to the outlying Branches.

Following the meeting a dinner was held in the same building. Other guests present included W. H. Bischoff, general superintendent of the Dominion Iron and Steel Company and M. A. Doak, comptroller of the British Empire Steel Corporation. In spite of bad weather, members turned out in good numbers, and the evening was voted a success. W. S. Wilson, A.M.E.I.C., was responsible for the entertainment and S. C. Mifflen, A.M.E.I.C., for the arrangements made at Glace Bay and

many thanks are due to them for the energy and time devoted to the meeting.

Submarine Mining

On Tuesday, November 14th, F. W. Gray, A.M.E.I.C., assistant to the vice-president of the British Empire Steel Corporation, addressed the Branch on the above subject, K. H. Marsh, M.E.I.C., vice-chairman of the Branch, presiding.

Mr. Gray's address was similar to one he gave to the Montreal Branch some time ago — a sypnosis of it appearing under the Montreal Branch News in the May 1922, *Journal.* It was a subject of perhaps more vital interest in this locality, and a number of mining men present added to the discussion and brought out many additional matters of interest. W. Herd, mining engineer of the Dominion Coal Company, and A. L. Hay, A.M.E.I.C., assistant mining engineer, described various problems and experiences and Mr. Hay in particular pointed out the necessity of changes being made in the provincial mining laws governing various points of submarine mining. On a motion by Mr. Herd seconded by A. P. Theuerkauf, M.E.I.C., Mr. Gray was tendered a sincere vote of thanks for his address.

Halifax Branch

O. S. Cox, A.M.E.I.C., Secretary-Treasurer.

With an attendance of thirty-two, the first regular Branch meeting of the season was held at the Green Lantern, November 3rd. Chairman F. R. Faulkner presiding. Supper was served at 6.15 p.m., after which the meeting was called to order for transaction of business.

Nominations were called for members to comprise the Nominating Committee and the following were chosen:—H. B. Pickings, A.M.E.I.C., (convener), W. A. Winkfield, M.E.I.C., W. F. McKnight, A.M.E.I.C., Geo. Holmes, S.E.I.C.

The chairman then introduced F. H. Bell, K.C., city solicitor, who gave a very instructive address on "Engineering from the Legal Standpoint". The speaker prefaced his remarks with the statement that many legal difficulties and much litigation may be avoided by the employment of competent legal advice at the beginning of an engineering project or contract rather than by engaging a lawyer only after difficulties have arisen and a lawsuit is pending. Getting a contract into proper shape at the beginning is important, and this can best be done by a properly trained legal mind. The drafting of contracts and specifications often falls to the lot of the engineer, but the speaker advised that the engineer refuse to accept the responsability for the validity of such documents, as this work should be performed by a lawyer, since he is specially trained for the proper execution of such documents. It is advisable in contract drafting to avoid as much as possible the use of legal words and phrases because a wrong or unintentional meaning may be given owing to a lack of appreciation of the full significance of the terms used. Be accurate in description and careful in the choice of words. If long and cumbersome names or titles must be used throughout a specification, insert an interpretation clause, substituting short titles, then be consistent, always using the same word or title when referring to the same subject. Avoid obscurity. Use short simple sentences, paragraphs, sections and sub-sections, and keep together all clauses that deal with the same subject matter. If in a contract draft, specification and schedule are drawn separately the schedule must be deemed part of the contract and attached thereto. Be careful that there is no variation between specification and schedule. Specify how tenders are to be

handed in and give exact date for receiving them. Acceptance of a contract must be unconditional as any added conditions make the acceptance equivalent to a refusal. Any alterations in a contract must be within the contract itself and can only be made with the consent of the guarantor, otherwise the guarantee bond will be released. The clause appearing in most engineering contracts giving the engineer the power to make a final decision in case of disputes is a dangerous one, the courts ruling that this is an arbitration clause and since the engineer is usually employed by one party to the contract he must be partial to his employer, and the moment he shows any partiality he ceases to be an arbitrator, hence the clause does not apply.

Following his paper Mr. Bell answered a number of questions asked by members of the Branch and many interesting points were brought out in the discussion. The appreciative thanks of the Branch were tendered Mr. Bell for his interesting address.

The Branch was fortunate in having Fraser S. Keith, M.E.I.C., general secretary of *The Institute*, as a special guest. He was called on for a few remarks and gave the members an interesting talk on *Institute* affairs. Mr. Keith gave a brief resume of the work and activities of *The Institute* referring especially to the rapid growth in membership during the last few years, the recent progressive changes in policy and to the reports of various special committees. *The Institute* is the only national engineering organization in Canada and can, through the earnest co-operation of its large membership — now over 5,300 — be made the vehicle whereby the profession can be uplifted throughout the Dominion.

After various members had voiced the appreciation of the Branch for Mr. Keith's encouraging remarks, the meeting adjourned at 9.30 p.m.

Moncton Branch

M. J. Murphy, A.M.E.I.C., Secretary-Treasurer.

The Moncton Branch held their regular monthly meeting in the form of an address and luncheon at the Barker House, on Wednesday evening, November 8th. Prof. McKiel, A.M.E.I.C., of Mount Allison University, Sackville, N.B., presided in the absence of the chairman, F. B. Tapley, M.E.I.C. The chairman, after a few pleasing remarks on the activities of *The Institute* in general, introduced Dr. Van A. Clarke, the speaker of the evening.

Dr. Clarke in beginning his address on Radio-Telephony, said that he felt that in speaking to a body of engineers on a subject of this nature, that he was in a sense "Carrying coals to Newcastle", nevertheless he would try to do the very best he could with the subject. Dr. Clarke then described in general the history of radio from its infancy and followed and explained its development up to the present. Each improvement made was explained and the technicalities of the radio receiving set were pointed out by sketches on a black board. The speaker seemed to be thoroughly at home on the subject, and from his remarks has spent a great deal of time and study on the subject.

Fraser S. Keith, M.E.I.C., general secretary of *The Institute,* who is on a visit to all the different branches in the Maritime Provinces, spoke on matters pertaining to *The Institute* in general. He told of the work that had been done by *The Institute* in the past and what was proposed to be done in the future. In speaking of the organization as a whole, he mentioned the fact that in the republic to the south there was a great number of engineering societies, while in Canada all engineers were embraced under one, which he felt was an advantage in many ways.

A. E. McNutt of Moncton, who was kind enough to set up his radio receiving set in the dining room, gave a very enjoyable concert. From Newark part of a musical concert was heard perfectly; from Arlington the time signals were taken; while Cambridge also was heard. During the first part of the evening the transmission was very clear, but owing to a sudden change in the weather, interference which could not be overcome caused considerable breaks in the concert.

A very pleasing part of the evening's entertainment was the vocal solo numbers by Mr. Alonzo Johnson, who sang in splendid voice and manner "Only In Dreams", (from the Knukerbreken Opera), and for an encore, "The Longshoreman".

Border Cities Branch

J. Clark Keith, A.M.E.I.C., Secretary-Treasurer.

On Saturday, October 14th, members of the Border Cities Branch and their friends were the guests of the officials of the Canadian Steel Corporation at Ojibway. Met by W. H. Baltzell, M.E.I.C., at the office of the company, they were given such refreshments as may be obtained in a dry country. Before proceeding to the works under construction, the plant layout was explained from maps in the office. A tour was then made of the property, including the blast furnaces from which an excellent view of the surrounding country could be obtained, the wire mill and the machine shop, not omitting the police dogs of two generations. Detailed information was supplied by Mr. Baltzell and by officials of the Canadian Bridge Company who were familiar with the structural design. The entire afternoon of a delightful autumn day was spent in a most interesting manner and the keenest interest was displayed by the forty or more members who were present.

The regular meeting of the Border Cities Branch was held in the Prince Edward hotel on Friday, November 10th, at 7 p.m., at which twenty-two members were present. The customary dinner feature preceeded the business and address of the evening.

The chairman made a brief reference to the meeting in December and to the election of officers at that meeting. It was very desirable to have every member present at that meeting and the question was raised as to where this meeting should be held. It was moved by A. J. Riddell, A.M.E.I.C., and seconded by E. F. Considine, M.E.I.C., that the annual meeting be held in the Prince Edward hotel.

M. E. Brian, A.M.E.I.C., city engineer of Windsor, entertained the gathering with his "Reminiscences of a City Engineer". Mr. Brian expressed the thought that "Reminiscences" were hardly appropriate as that word could usually be associated with hardening of the arteries

and that he would have to live as long again before such a condition might be found. As far as he knew he was the only one present who had been born in Windsor and from the day when he had his first glimpse of Windsor to the present time he had seen the place grow from a straggling town of 3,000 to the rapidly growing city of 42,000, that it is to-day. His school mates, who had for the most part gone into business, chose more lucrative fields than he had done, but he loved the engineering game. Wm. Newman, the city engineer of Windsor in those earlier days, received $6.00 per day when he worked. Victoria avenue, the principal residential street of Windsor to-day, was then all bush and Tecumseh road was a place where nuts abounded. There were then no sewers west of Bruce avenue nor east of Parent avenue. When he became city engineer, twelve years ago at $1,600 per year, there were no houses south of Wyandotte street. Humorous anecdotes were interspersed throughout in his inimitable Irish manner.

Mr. Brian gave in detail the work which was involved in the construction of each local improvement and the various methods by which it could be undertaken. *He abjured engineers to stop the criticism of their fellow engineers, but rather to boost them and place them on a par with the professions of law and medicine.* A tribute was paid to the earlier engineers of the district in their vision and foresight in laying the first sewers which were still adequate for the city's needs. His memories of municipal work were most pleasant and his work could not have been carried out without the co-operation of council, the public and the press. Everybody made mistakes, no one knew it better than he did but when such things happen to your fellow engineers "chide him in secret not openly".

The operation of the civic asphalt plant was explained in detail. The Windsor plant has a capacity of 1,800 yards of 2 inch compression in 9 hours. Eight hundred yards a day was considered a good average but they had had one run of 8,085 yards in seven days. Mr. Brian promised later to give operating costs to the Branch when they had been tabulated.

Following the address, ways and means were discussed for increasing the attendance of meetings. G. F. Porter, M.E.I.C., thought that engineers do not receive the recognition or the remuneration they deserve because they do not associate more along fraternal lines, developing the art of expressing themselves and selling their services to the public. Many members had transferred to the Border Cities Branch who did not attend the meetings. The meetings are for the younger men, the older men are in more permanent positions and do not stand to gain as much as those just starting out in life.

The regular meetings of the Border Cities Branch were resumed on October 13th, when thirty-nine members and prospective members gathered at the Prince Edward hotel for dinner.

W. H. Baltzell, M.E.I.C., chief engineer of the Canadian Steel Company, extended an invitation to all present to inspect the property and the construction now being carried on at Ojibway. The invitation was most heartily accepted and arrangements were made to gather there on Saturday, the 21st, at 2.30 p.m.

G. F. Porter, M.E.I.C., made a brief reference to the General professional meeting held in Winnipeg early in September. Very interesting papers were presented dealing with hydraulic questions and the effects of alkali on concrete. The spirit of brotherhood appeared to prevail throughout the entire gathering and their hospitality was so abundant that even the engineers weakened under a succession of laden tables.

C. E. Goodrich, M.E.I.C., of the Canadian Bridge Company, then gave a most interesting address on "The Design of Transmission Towers". The transmission tower field is a highly specialized field. So is any field that deals with large tonnages and low prices; and as large tonnages mean small percentages of profit, transmission tower work has come to be the product of special equipment and such methods as make low prices possible. The manufacturer should have a small fabricating shop used for nothing else, where all the machinery is especially planned for very light work, and incidentally is unsuited for the most economical work even on the average roof truss.

The paper was so interspersed by the speaker with humorous personal reminiscenses that his listeners were presented with the features of a highly technical subject in a very matter of fact way and it was much appreciated by all present.

Ottawa Branch

F. C. C. Lynch, Associate E.I.C., Secretary-Treasurer.

A brilliant and enthusing address on the subject of the "Great Lakes - St. Lawrence Scheme" was delivered by Hon. J. A. O. Preus, governor of the state of Minnesota, at a luncheon held on November 15th, at the Chateau Laurier, by the Ottawa Branch. A large and distinguished audience was present, including the Prime Minister, the Leader of the Opposition, Cabinet Ministers and Government officials, the Premiers of four provinces, Government representatives of various provinces, the United States Consul General and several Minnesota State officials, as well as many prominent engineers. It was probably the largest luncheon ever held by the Ottawa Branch, the main dining room of the Chateau being filled for the occasion.

"Your views and mine may differ somewhat at times, but need knows no law," declared Mr. Preus. We need the waterways very badly. "Minnesota is the wealthiest state in the Union," he continued. "Not only was the state a leader in agriculture, but it also produced much iron. Minnesota being the largest producer of iron in the United States. One mine alone was valued at more than the whole amount mentioned by the Reparations Commission as the value of the iron of Alsace-Lorraine. Agriculture was the basic industry of Minnesota, however, and butter was a leading product." Mr. Preus mentioned these facts, he pointed out, because the products of the state would come down the proposed waterway. "It was also a fact that the impetus for the water route had been started in the state of Minnesota. It cost too much money to ship a carload lot by rail all the way from New York. New York city was farther from Liverpool than Buffalo by about 500 miles. With the all-water route there would be a saving of at least five cents per bushel in the shipping rate, according to an expert's

advice, and part of this saving would go to the consumer and part to the farmer."

Mr. Preus referred to the great population of eighteen states from the Allegheny mountains to the Rockies as having a bearing on the situation. To ship a ton of iron from Duluth to Boston cost $22.77 by rail and $5.55 by water. Under present conditions Argentine was a strong competitor with the best of the wheat states, such as Kansas and Nebraska.

"The extent of the improvement necessary in the Great Lakes-St. Lawrence River scheme to provide the waterway, including the building of locks for 34 miles where the water is shallow and the channel will have to be improved for 182 miles. This will cost $252,000,000. A few years ago, we built the Panama canal and that is of no use to the middle west. The Panama canal cost $400,000,000. Ten times the tonnage passes through the Soo canal in the open season as goes through the Panama canal in the whole year."

"Four million one hundred thousand water horse-power can be developed in the waterways scheme, and, out of that, 3,100,000 horse power will go to Canada. We are all interested in the proposition even in that light. Some objectors in New York say we should not spend money for any project outside of the States. That attitude is silly. We built the Panama canal and that is not on American soil. My view is that Canada is not foreign soil to the United States. People who speak the same tongue and have the same ideals can never have a disagreement that would lead to the taking up of arms."

Mr. Preus declared that any word spoken in the United States Senate against Canada would not be received kindly by many of the Senators themselves. The position of the United States was like that of a son who had left home when young. There was always a sincere regard for England, the old home.

In introducing the speaker, Mr. K. M. Cameron congratulated Mr. Preus on his recent re-election to the Governorship of Minnesota, which, he felt, was an endorsement of the policy established by him. Governor Preus is one of the most highly regarded figures in American State politics. His father went to the United States from Norway more than 50 years ago, and was one of the pioneers in the work of the Norwegian Lutheran church in the north western States. Mr. Preus was educated in public schools and graduated from Luther College at Decorah, Iowa. He has been successively Insurance Commissioner, State Auditor and Governor of his state, although still quite young in years. In 1920 Governor Preus headed a vigourous drive against socialism and red propaganda, the disturbing element having sought to secure dominance in Minnesota after obtaining a grip in North Dakota. They brought out a strong candidate for Governor, but Mr. Preus conducted such a stern campaign that he routed the opposition. Governor Preus is a public speaker of rare ability, and he delighted the large audience at the Chateau Laurier with his forceful address.

K. M. Cameron, M.E.I.C., presided, and with him at the head table were: Rt. Hon. W. L. Mackenzie King, Prime Minister; Rt. Hon. Arthur Meighen; Hon. Chas. Stewart, Minister of Interior; Hon. Dr. J. H. King, Minister of Public Works; Hon. E. C. Drury, Premier of Ontario; Hon. John Bracken, Premier of Manitoba; Hon. A. C. Dunning, Premier of Saskatchewan; Hon. H. Greenfield, Premier of Alberta; Hon. T. H. Johnson, ex.-attorney general of Manitoba; Hon. J. E. Brownlee, attorney general of Alberta; Hon. R. W. Craig, attorney general of Manitoba; Hon. J. G. Foster, United States Consul General; Hon. M. Hilton, attorney general of Minnesota; A. F. Pratt, assistant attorney general of Minnesota; E. H. Hussey, chief engineer, Minnesota and Ontario Power Company; J. Jewell; E. W. Backus, president of the Backus-Brooks Company, of Minneapolis; J. B. Hunter, Deputy Minister of Public Works; L. V. Rorke, director of Surveys for Ontario; G. P. Mackenzie, gold commissioner for Yukon; Fraser S. Keith, M.E.I.C., secretary, *Engineering Institute of Canada;* H. G. Acres, M.E.I.C., vice-president, *Engineering Institute of Canada;* Dr. J. G. Rutherford, Board of Railway Commissioners; A. St. Laurent, M.E.I.C., chief engineer, Department of Public Works; C. A. Magrath, M.E.I.C., chairman, International Joint Commission; Geo. A. Mountain, M.E.I.C., chief engineer, Board of Railway Commissioners; and Lieut.-Col. W. P. Anderson, M.E.I.C., past president of *The Engineering Institute of Canada.*

Branch Honours Dr. Deville, Hon. M.E.I.C.

Edouard G. Deville, LL.D., D.T.S., HON. M.E.I.C., director general of Surveys in the Department of the Interior, Ottawa, was the guest of honour at a luncheon held on October 31st, at the Chateau Laurier, by the Ottawa Branch, as a mark of esteem on the occasion of his election as an Honorary Member of *The Institute.* There was a large attendance of the members of the Ottawa Branch and others prominent in engineering and scientific research. K. M. Cameron, M.E.I.C., presided, and with him at the head table were: C. A. Magrath, M.E.I.C., chairman, International Joint Commission; T. Shanks, M.E.I.C., acting surveyor general, Department of the Interior; R. A. Gibson, assistant deputy minister, Department of the Interior; J. E. Featherston, private secretary to the Minister of the Interior; N. J. Ogilvie, M.E.I.C., superintendent of Geodetic Survey of Canada; G. B. Dodge, M.E.I.C., special surveys engineer, Topographical Surveys Branch; O. S. Finnie, M.E.I.C., director, Northwest Territories Branch; E. W. Hubbell, chief inspector of surveys; Dr. Charles Camsell, deputy minister of Mines; Dr. W. Bell Dawson, M.E.I.C., superintendent of Tidal Surveys; A. St. Laurent, M.E.I.C., chief engineer, Department of Public Works; J. J. McArthur, M.E.I.C., International Boundary Commissioner; C. H. Keefer, M.E.I.C.; J. M. Roberts, secretary, Department of the Interior; and J. B. Challies, M.E.I.C., director, Dominion Water Power Branch.

Mr. Cameron spoke of the esteem and honour in which Dr. Deville was held. He had not only brought renown to the Ottawa Branch in his great work, but had brought recognition to the engineering profession in Canada and placed it on a par with the foremost in the world. Through his promotion, he had taken his place in company which was the lot of few to associate with, and he had been in every way worthy of the honour; in fact if there had been any higher honour conferrable, it would have probably been extended to him.

Charles A. Magrath, in a few words of tribute to Dr. Deville, referred to the early recognition of his ability, by being commissioned to represent Canada on many International Committees in all parts of the world where Canadian scientific interests were in the limelight.

Thomas Shanks spoke of the appreciation and esteem ıeld for him in the branch of the department of which ıe had charge. The development of the Canadian West ıad commenced in earnest with the appointment of Dr. Deville to the office of Surveyor-General, and he ıad kepth is work abreast and ahead of the development, so that to-day Canada had the most perfect system of Dominion Lands Survey, with particular reference to the western provinces that any country in the world could boast. The perfecting of this system was in the main lue to the efforts and genius of Dr. Deville. Mr. Shanks hen presented Dr. Deville with a gold badge of member-hip in *The Institute*.

E. DEVILLE, LL.D., D.L.S., F.R.S.C., Hon. M.E.I.C.

Dr. Deville in replying expressed himself as deeply ouched by the tributes which had been paid to him by he various speakers. Of all the honours which might ave been his, had he been able to qualify for any others, he one he valued most was the one which had just been onferred on him. He gave a most comprehensive account f the work of the Dominion Lands Survey, over which e had the honour of being chief, and related amusing necdotes of his experiences with Sir John A. Macdonald uring his term of office as Premier, arising out of Sir ohn's pronounced antipathy for anything pertaining to ngineering, surveying or science. At all times he treated ıe men of the department with contempt, and exacted f them the utmost efficiency, which in Dr. Deville's pinion was probably the secret of the efficiency of the epartment to-day.

Dr. Deville began his brilliant career as an officer ı the French navy, when he was in charge of extensive hydrographic surveys in the South Sea Islands, Peru and other countries. Resigning a naval career in 1874 he came to Canada and after valuable service rendered to the province of Quebec in connection with provincial surveys, he joined the staff of the Surveys Branch of the Dominion Government. His initiative and ability soon brought him to the front. When Lindsay Russell resigned from the position of surveyor general, Dr. Deville was called upon to succeed him. This position he held until early in the present year when he was made director general of surveys and was placed in charge of the surveying branches of the Department of the Interior comprising topographical surveys, geodetic surveys and international boundary surveys. Besides being the author of various text books that are highly valued by his profession, such as "Astronomic and Geodetic Calculations" and "Photographic Surveying", Dr. Deville has contributed numerous scientific papers, notably to the Royal Society of Canada, of which he is a charter member, and of which he was for many years since its formation, secretary of the mathematical section. In the realm of photographic surveying he is universally recognized as one of the world's authorities, and it is worthy of note that in the recent Mount Everest expedition, photographic surveys were made with a camera copied from those designed by Dr. Deville for use on Canadian surveys. The University of Toronto in 1905 paid a tribute to his service to the cause of science when they conferred upon him the honorary degree of Doctor of Laws, while in 1916 His Majesty the King rewarded his faithful work by appointing him a Companion of the Imperial Service Order, as a recognition of the sterling services he has rendered to Canada and to the Empire by his researches. Last May he was further honoured by being appointed to represent Canada at the meetings of the International Union of Geodesy and Geophysics held at Rome, when no less than twenty allied countries were represented.

Although he has given the greater portion of his energies to scientific research and to the perfecting of the Dominion Lands Surveys system, the efficiency of which to-day is such a tribute to his remarkable initiative and ability, yet he can still find time for other activities, particularly in the interests of St. Luke's Hospital, Ottawa, of which institution he has been a Governor since its inauguration in 1898. He is also a Governor of the "Alliance Française". In addition to these, a list of Dr. Deville's activities includes: office of chairman of the Dominion Board of Topographical Surveys and Maps, chairman of the Board of Examiners for Dominion Land Surveyors, chairman of the Geographic Board of Canada, member of Canadian Engineering Standards Association, member of the Ottawa Municipal Hospital Commission, member of the Air Board of Canada, Patron of the Town Planning Institute of Canada, Patron of the Dominion Land Surveyors' Association.

In taking his place among the Honorary Members of *The Engineering Institute of Canada*, Dr. Deville will be in distinguished company. Previous to his election, there were only ten living members on the list. Among these are H.R.H. The Prince of Wales, H.R.H. The Duke of Connaught, The Duke of Devonshire, The Earl of Aberdeen and General Lord Byng of Vimy, the present Governor General of Canada.

Lethbridge Branch

G. S. Brown, A.M.E.I.C., Secretary-Treasurer.

On October 7th, Colonel H. C. Boyden, of the Portland Cement Association, Chicago, addressed a special meeting of the Lethbridge Branch, the subject being "Concrete Highway Investigations and Specifications". Following the address there was an interesting discussion which lasted late into the evening.

Work in the Punjab

A. M. Robertson, executive engineer of the Punjab, India, addressed a special meeting of the Branch on Friday, November 10th. A brief outline was given, covering the construction and operation problems which were encountered in the Punjab. Coolie labour has been chiefly employed in the past years, but owing to its higher cost at the present time, the reclamation work is in a transition stage and modern machinery is being introduced. The Punjab, through irrigation, has become a highly productive part of India. Ten and one-half million acres of land are being served with water by five rivers, Jhelan, Chenab, Raire, Beas and Sutlej. (The meaning of Punjab is "The Land of the Five Rivers.") Two crops, cotton and wheat, are raised annually. Irrigation systems in the Punjab are government owned, the investment giving a net return of eleven and one-half per cent. The most recent scheme is the Sutley Valley project, comprising five million acres. This will represent an expenditure of £8,000,000, and is expected to give a return of thirty-five per cent. Mr. Robertson is in America studying irrigation construction methods, and while in Lethbridge, was shown over the C.P.R., and the Lethbridge Northern Irrigation districts. He expressed admiration for the irrigation systems in Alberta.

C. M. Arnold, M.E.I.C., on behalf of the Branch, extended a hearty vote of thanks to the speaker of the evening.

These two Branches meetings were each preceeded by the usual dinner and social time.

Edmonton Branch

R. H. Douglas, A.M.E.I.C., Secretary-Treasurer.

With an attendance of fifty, a very successful meeting of the Edmonton Branch was held in the Edmonton Board of Trade rooms on Wednesday, November 15th, at 8 p.m., Col. J. G. Reid, M.E.I.C., being in the chair. Three excellent fifteen-minute papers were given, each one being followed by a fifteen-minute discussion.

R. W. Ross, A.M.E.I.C., gave a paper on railroad organization, pointing out in a very clear manner the various duties of the superior officers in the organization. By the use of a chart the working of the organization was traced from the president through all the various officers down to the common laborer.

R. B. Baxter, superintendent of the Alberta Government telephones, gave a very interesting address on telephony, tracing the growth and advancements made since its inception some forty-seven years ago. Mr. Baxter described how, by the use of apparatus known as repeaters, the talking range was practically unlimited. Mr. Baxter stated that the longest known conversation made as a test was some 10,000 miles. Mr. Baxter discussed the possibilities of the radio phone replacing the telephone in commercial use, but stated that in its present form it could not be satisfactorily used owing to the fact that conversations could be heard by anyone tuneing-in their instruments with the instrument being used.

A. E. Cameron, of the University of Alberta, in his paper went into the commercial possibilities of smelting iron ores from the vicinity of Athabaska lake. Mr. Cameron stated that for the production of pig iron from ore, two other materials, fuel (coke) and flux (limestone) are required. Limestone for fluxing purposes could probably be obtained from Devonian limestones outcropping on Athabaska river, but the nearest coal deposits suitable for the manufacture of metallurgical coke occur in the Jasper Park district of Alberta, about 600 miles from Athabaska lake. With regard to the possible position of a smelter for these iron ores, the advantages and disadvantages of different locations were outlined, and a location at Waterways assumed. Making the assumption that transportation rates on materials to, and products from, the smelter would be about the same as existing transportation rates on coal throughout the Prairie Provinces, it was next shown that under exceedingly favourable conditions, including an operating extension of the Alberta and Great Western Railway from Waterways to Athabaska Lake, good grades of ores from Athabaska lake could be smelted and resultant pig iron placed upon the Edmonton market at about $35.00 a ton. Market conditions for this product were then gone into and it was shown that the cost of long rail hauls would prohibit any extensive development of an export market while the market for pig iron in the province of Alberta would clearly not warrant the production of pig iron even under the extremely favourable conditions assumed.

Kingston Branch

L. T. Rutledge, M.E.I.C., Secretary-Treasurer.

The opening meeting of the Branch for the session 1922-23 was held on October 10th. On this occasion part of the regular business of the annual meeting was transacted. The annual meeting, however, was held officially on October 25th.

The secretary's annual report was received. His financial report showed the financial condition of the Branch to be satisfactory, the cash credit balance having been considerably increased during the year. A few new corporate members had been added and but very few old ones having been lost through transfers, so that the membership showed a net increase. In addition approximately ninety students members had been enrolled during the past year.

Within the past twelve months, the executive had formulated a set of by-laws which were approved by Council in February, 1922, and shortly afterwards adopted by the Branch.

The secretary thanked the officers and members of committees for their loyal co-operation and assistance during the year. The success of the Branch was due entirely to the general interest shown by officers and members of every grade.

The report of the Programme and Entertainment Committee was presented by R. J. McClelland, A.M.E.I.C., the convenor of the committee. Twelve regular meetings were held during the year and excellent papers were given. In the lectures and addresses, the committee had endeavoured to enhance the interest of the public and the university towards the profession. The meetings were well attended during the session and many indications were evident that interest in the Branch had been gradually growing.

The chairman, Professor W. P. Wilgar, in a general way reviewed the activities of the Branch. He congratulated the Branch on the honour shown one of its members, namely, Dean Clark, Dean of the Faculty of Science, Queen's University, who had recently been elected an Honorary Member of *The Engineering Institute of Canada*. Dr. Clark has been closely associated with engineering for the past eighteen years. He has been more closely associated with engineering research and scientific engineering, than with field engineering. The Branch is, indeed, very grateful to the Council for the honour bestowed on Dr. Clark.

Election of officers for the year 1922-23 was held and the following were declared elected.

Chairman	L. M. Arkley, M.E.I.C.
Vice-Chairman	T. A. McGinnis, A.M.E.I.C.
Secretary-Treasurer	L. T. Rutledge, M.E.I.C.
Executive	L. M. Arkley, M.E.I.C., T. McGinnis, A.M.E.I.C., L. T. Rutledge, M.E.I.C., Col. T. Anderson, A.M.E.I.C., W. L. Malcolm, M.E.I.C., G. S. Smith, A.M.E.I.C.
Programme Committee	D. S. Ellis, A.M.E.I.C., (convenor) Major G. Turner, A.M.E.I.C., Major L. Grant, A.M.E.I.C., D. Jemmett, A.M.E.I.C., A. Jackson, A.M.E.I.C.

On the business of the annual meeting being concluded, Professor Wilgar retired from the chair, which was then taken by Professor L. M. Arkley, the chairman-elect. Professor Arkley thanked the Branch for the honour done him in electing him unanimously to this important position, an honour that every member should strive to attain. He emphasized the point that each member should be an active one and endeavour to hold at some time or other an office in the Branch, so as to become more closely associated with *The Institute* and become more interested in its welfare. He concluded his remarks by an assurance that the officers would put forth every effort to make the coming year as successful, if not more so, as the one just concluded.

The address of the evening was given by Professor Alexander Macphail, D.S.O., professor of general engineering in Queen's University. He chose as his subject one somewhat philosophical in nature. The address was entitled "Observations and Reflections". The observations were made during his recent travels abroad in the Near East. The reflections were made during those travels and ever since. He analyzed at considerable length the society, environments and conditions effecting the life and aspirations of the dark-skinned races of the East. The address had a humorous tone to it and was intensely interesting. A hearty vote of thanks was tendered Professor Macphail.

The next regular meeting of the Branch was held on November 14th, at which meeting G. S. Monture, B.SC., manager of the Employment Bureau of Queen's University, gave an address entitled "Evolution of Prices and Wages". The paper was suggested by the epoch-making rise in wages and prices which had been caused by the World War. The speaker inferred that the only correct way to study the present conditions was to review the revolutions in standard wages and prices that have taken place in the past. Then one might be able to judge whether the present abnormal conditions will be temporary or permanent, and if only temporary, how long they may be expected to continue. Accordingly price levels were studied almost from the dawn of history, and with the aid of graphs the speaker made it quite apparent to the audience that labour conditions are improving gradually.

A hearty vote of thanks was tendered Mr. Monture for his very interesting paper.

Winnipeg Branch

George L. Guy, M.E.I.C., Secretary-Treasurer.

At the October meeting of the Winnipeg Branch at which the chairman of the Branch, C. V. Caton, M.E.I.C., presided, a very interesting address on concrete highway investigations and specifications was given by Lt.-Col. H. C. Boyden.

The speaker stated that the United States has now 262 million square yards of concrete road of which 187 million, or about 71½ per cent has been built during the last five years. Canada has 6 million square yards, of which 54.2 per cent has been built during the last five years. Of the total yardage in the United States 52½ per cent is in twelve states lying north and east of the state of Missouri, which is considered to be ample evidence that a concrete surfaced road is adaptable to a cold climate. The speaker further said that it was impossible to obtain the cost of all the roads constructed but assuming, as an average, that the cost was $2.50 per square yard, the total investment in the United States must be $655,000,000, and in Canada $15,000,000. In 1921, $160,000,000, or 24.4 per cent of the total was invested and it is at present indicated that the investment in 1922 will amount to $240,000,000. The salient facts shown by these figures are: — The enormous growth during the last few years in the use of concrete road surfaces. The satisfaction which such a surface evidently affords, and the resulting enormous investment. That of greatest interest to the engineer is the enormous investment and the necessity of safeguarding this is obvious and may be accomplished in two ways; by permanent construction, and by adequate maintenance. While maintenance is essential for any type of road, there can be no doubt that an investment such as this can be best protected by permanent construction in the first instance. It becomes necessary therefore, in view of the large sums of money, which have been and are about to be spent in the construction of roads to make exhaustive search for the purpose of establishing what is the most permanent type of construction.

The speaker referred to the many investigations in the nature of observations of the effect of ordinary traffic on certain selected sections of recently constructed highways, which are being made at widely separated points

and under widely different conditions. The United States Federal Government has recently established an advisory board for the purpose of collecting, collating and co-ordinating the results of all these tests, the most valuable series of which are those being carried out on specially constructed sections of road under controlled and known traffic.

As a result of his observations of these tests, Colonel Boyden stated, he had made the following recommendations:—

The recommendations regarding sud-grades might be summarized as follows:

(1) Soil studies should be made long in advance of construction.
(2) Every precaution should be taken to insure a uniform sub-grade.
(3) The design of the slab should be varied to suit the bearing power of the soil.
(4) The preparation of a sub-grade ought to be a separate item in the contract.
(5) The ditches should be so designed as to carry the water away quickly.
(6) A close study of their economies should be undertaken before deciding to put down tile drains.
(7) Gumbo soil should be pulverized and recompacted for a depth of eighteen inches to twenty-four inches.
(8) Pervious sub-grades should be sealed before laying concrete
(9) Old roads should be scarified.

Summary of chief recommendations appertaining tc concrete slabs:—

(1) For one-way traffic the minimum width of pavement should not be less than ten feet — for two ways twenty feet — for three ways thirty feet, and so on.
(2) In grading, allowances should be made for shoulders not less than five feet wide.
(3) The shoulder should not be gravelled.
(4) Concrete surfacing less than six inches thick should not be built under any circumstances.
(5) Concrete surfaces six inches thick should be restricted to traffic not exceeding two tons.
(6) The minimum thickness for any heavier loading should be eight inches.
(7) Study should be made as to the economy of increasing the width where the sub-grade is poor.
(8) The Arizona section a six inch pavement nine inch at the sides for a width of two feet seems to offer certain advantages.
(9) Expansion joints should be put in at all changes in alignment and grade, at one hundred foot intervals in a reinforced concrete slab and fifty foot intervals in a plain concrete slab.
(10) All joints should have three-quarter inch dowels six feet long and not more than five foot intervals, one half of the dowel to be oiled to permit expansion.
(11) A longitudinal centre joint is an advantage but if used should have a two-inch radius semi-circular key.
(12) Reinforcement does not increase the strength of the concrete slab.
(13) If reinforcement is used it should be at the rate of sixty pounds per hundred square feet.
(14) Reinforcement should be either in the centre or two inches from the top of the slab.
(15) Longitudinal reinforcement, consisting of three and a half inches round rods in the centre of the slab, should be used on all edges.
(16) Care should be taken to insure a perfectly smooth surface; a ten foot straight edge placed anywhere should show no appreciable deviation.
(17) All joints and cracks which may develop should be carefully inspected and continuously maintained.

Recommendations regarding mixing and proportioning concrete:—

(1) The ideal mixer is one on which there is provision for measuring accurately and automatically the ingredients, and which once having started to rotate a batch cannot be dumped until the batch is completely mixed.
(2) It would appear as a result of recent tests that the strength of concrete increases very rapidly from the time of mixing up to one minute and a half, therefore this is the minimum time any one batch should be mixed.
(3) All concrete road surface, where practicable, should be ponded for a period of three weeks after being poured. If it is not possible to supply sufficient water for the surface it should be covered with moist earth for a similar period

At the close of his address Colonel Boyden showec a number of lantern slides illustrating the tests being carried out on the Bates and Arizona roads and also the construction of a concrete pavement on a new hydraulic fill in the city of Chicago. An interesting discussion followed in which a considerable number of the members took part

Calgary Branch

J. A. Spreckley, A.M.E.I.C., Secretary.
Lloyd R. Beach, A.M.E.I.C., Branch News Editor.

"Irrigation in the Punjab" was the subject of a tall given before the Calgary Branch on November 3rd, b A. N. McI. Robertson, M.I.C.E., who is an executiv engineer in India, travelling in western Canada to observ irrigation practice here. Mr. Robertson spoke from ver brief notes for over an hour and then answered question for as long a time. Describing conditions in the Punjab the speaker said that labour is cheap but machinery i very expensive, while for construction purposes, rock fo masonary is usually available within one hundred miles c the works. Cement, which until recent years was im ported from England, is not economically available fc engineering works, and wood is very little used. Bric is manufactured locally at a low cost and in the absenc of clean sand, pulverized brick, known locally as "Surkhi is used for mortar.

With a rainfall varying from three to four inches i the lower plains to twenty-five to thirty inches in th foothills, the rivers from which the water supply drawn, have a range in stage from 3,000 second-feet t 70,000 second-feet and occasionally as high as 600,0C second-feet during summer floods.

Irrigation has been practised for a great many yea by since the advent of the British to India large cana have been constructed in the Punjab and settlement irrigated lands has been very successful. When well estal lished these yield a net profit up to 11¼ per cent. Tl total irrigated area in the Punjab is about ten and on half million acres.

Stone masonary in lime or hydraulic lime mort forms is used for the bulk of the headworks. These headworl usually simply a weir, up to a mile in length, wi iron shutters on the crests so arranged that when a floc comes, one shutter is dropped by hand and the rest f automatically one after the other. While easy to dro much labour is necessary to replace them upright. Tl newer designs are calling for Stoney gates. Manipulatic of undersluices is necessary to avoid silt bars from formir in front of canal intakes, and it is only by practice th successful means have been found for accomplishing th

It is no part of the plan to dredge silt from cana Instead silt is kept moving all the time until water reach the land. Kennedy's hydraulic tables are consider

invaluable in designing canals to accomplish this. Moreover, canals are never as a rule run part full. They are run full or not at all. If water is not available to run them full, rotation in use of distributaries is resorted to. Some sort of module to limit the supply to each user is considered necessary. The Harvey and Stoddart module is the newest type, details of which may be secured from Messrs. G. Kent and Company, Luton, England, the manufacturers.

It is anticipated that an irrigation scheme at a cost of about £8,000,000 will shortly be operated on a new tract of about 5,000,000 acres. This work is now in progress.

Proportional Representation

Although the system of proportional representation is now very generally adopted in elections, the underlying principles are little understood by the general public and P. Turner Bone, M.E.I.C., is to be congratulated on the very lucid explanation which he gave to the Calgary Branch on Tuesday evening November 7th, at the Board of Trade rooms. In order to appeal to the graphic instincts of engineers Mr. Bone had prepared five charts to illustrate the subject and traced the history of the system from the Presbyterian method of holding a series of elections to secure a majority for one candidate, by a process of elimination. Those present who were not familiar with the specific advantages of the scientific compilation of election results were very much impressed by the clear statement of the facts as applied to a few simplified cases and in thanking Mr. Bone for his address the chairman, P. J. Jennings, M.E.I.C., expressed his astonishment at the speed and accuracy with which it was possible to determine the results at municipal and other elections where many thousands of votes were involved. It was evident that the lecturer had given the whole subject very close study and the interest of the meeting was evinced by the large number of questions of detail taken up in the discussion.

Toronto Branch

O. M. Falls, A.M.E.I.C., Secretary-Treasurer.

The weekly meetings of the Toronto Branch since the opening of the fall session have been very well attended. At all meetings both interesting and profitable discussions have been developed, and the executive, having a formidable array of talent reserved for the coming meetings, feel confident that the membership will show their approval by their continued regular attendance.

Town Planning Legislation.

The meeting of October 26th was taken up with a discussion of the proposed town planning bill as prepared by a committee of the Town Planning and Housing Association, and which is to come before the next session of the legislature for consideration. Arrangements for the evening were in the hands of Norman D. Wilson, A.M.E.I.C., of the Toronto Harbour Commission who, in introducing the subject defined town planning as "community foresight". He gave as the main objectives of the bill the establishment of provincial supervision, of adequate machinery to aid the development of suburban areas in the mutual interests of both suburb and city, and the retaining of the Ontario Railway Board as a court of appeal for all parties.

The functions of the Central Bureau of Town Planning and the Town Planning District Commission were very ably presented by W. S. B. Armstrong, secretary of the Ontario Town Planning and Housing Association. Mr. Armstrong instanced the resemblance between the duties of the central bureau and the local government boards as constituted in Great Britain.

R. Redman, solicitor for the township of Scarboro, presented the case of a township lying partly within the suburban area of a growing city and out of a vast fund of experience in municipal matters touched on many problems of vital importance which the proposed act sought to correct.

In the discussion which followed, G. G. Powell, M.E.I.C., deputy city engineer of Toronto, and James Govan, provincial architect, spoke briefly. T. D. leMay, city surveyor, also answered many criticisms of the bill and explained the purpose and limitations of several sections relating to the powers to be invested in the proposed commissions.

Light Alloys in Structural Engineering Practice.

The Toronto Branch listened to a very interesting address on November 2nd by Professor O. W. Ellis, A.M.E.I.C., of the department of metallurgical engineering, University of Toronto, on the subject of the use of light alloys in structural engineering practice. Professor Ellis is a recent addition to the staff of the university and if we may judge from the interest aroused in his initial lecture to the Branch his talent will be eagerly sought after in the future. This paper is published elsewhere in this issue of *The Journal.*

Students Night.

The evening of November 9th was reserved for students night and a large attendance of the undergraduates of the Faculty of Applied Science taxed to the limit the seating capacity of the lecture room at the Engineers Club. The speakers of the evening were all students of this year's graduating class of the University and the manner in which they presented their various subject was highly commendable to the staff of the institution which they are attending.

F. A. Ellis, S.E.I.C., spoke on the subject of "Power Factor" as applied more particularly to the induction motor. After deriving an expression for its determination in terms of electrical units, he dwelt upon its practical importance in the economic use of power. Mr. Ellis is graduating in the electrical department and was during vacation periods employed by the Toronto Hydro Commission on station maintenance, office and test work.

D. B. Strudley, S.E.I.C., dealt with the subject of "Manufacturing Cost Accounting" with particular attention to factory overhead. Various methods of cost accounting were outlined and suggestions offered to ensure proper distribution of overhead charges. Mr. Strudley is specializing during his final year in thermodynamics and hydraulics and has been during his vacation periods employed by the Imperial Rattan Company, Stratford.

The concluding speaker was H. F. Robertson, S.E.I.C., who spoke on "Refractory Materials". He exhibited samples of various refractory products and explained the significance of the test to which they were usually subjected. Mr. Robertson is completing his fourth year in the department of chemistry and spent the past summer at the Mellon Institute, University of Pittsburg, employed in the inspection and research of refractories.

The Inspection of Ferrous Material.

Professor E. A. Allcut of the department of mechanical engineering of the University of Toronto at the regular meeting of November 16th, presented in an extremely lucid manner a short treatise on the inspection of ferrous materials. After comparing the relative severity of the test applied to materials used in ordinary engineering practice with those used in automobile and aeronautic manufacture Professor Allcut outlined the various tests applied to rolled sections, drawn tubes, forgings and castings. The speaker advised the holding of all materials in bond by the inspection department prior to its release when inspected to the various production departments. A system of identification marks, that would indicate the source of manufacture, the class of steel and the heat treatment to which it had been subjected was also carefully explained. Professor Allcut dwelt at some length with the injurious effects of overheating forgings and the detection of seams and piping in ingots. He favoured quenching in an oil bath rather than water when tempering these materials. The necessity of chemical and microscopic examination of castings as well as the importance of their proper design to facilitate the escape of gas and air during solidification was emphasized by Professor Allcut.

Considerable discussion took place chiefly in respect to the failure of castings. Among those taking part were — Professor C. R. Young, M.E.I.C., J. A. Freeland, A.M.E.I.C., A. U. Saunderson, A.M.E.I.C., G. W. Winkler, M.E.I.C., and Professor J. R. Cockburn, M.E.I.C.

The programme for the remainder of the fall session includes the following:

Nov. 30th — The Local Improvement Act, by R. C. Harris, commissioner of works, city of Toronto.

Dec. 7th — The Purification of Public Water Supplies, by M. J. Howard.

Dec. 14th — Discussion of the report of the committee of *The Institute* on Classification and Remuneration, lead by A. H. Harkness, A.M.E.I.C.

On January 11th the winter session will be opened by an informal dinner and entertainment to be held at the Engineers Club.

Peterborough Branch

R. C. Flitton, A.M.E.I.C., Secretary.

A meeting held on the evening of October 26th, in the assembly room of the Collegiate Institute was addressed by G. M. Middleton, E.E., Mem. A.I.E.E., of Toronto, who gave an interesting talk on "Vacuum Tubes for Radio Work". The speaker gave a very good explanation of the tubes in non-technical language and accompanied his address by demonstrations of radio apparatus, picking up, during the evening, part of a programme broadcasted from Pittsburg, Pa. He also showed how broadcasting was done, by actual demonstration. The functioning of radio apparatus was very well depicted by means of special moving picture films which Mr. Middleton provided. An invitation was extended to the general public to attend this meeting and there was a good attendance of interested listeners. The meeting was presided over by E. R. Shirley, M.E.I.C.

Annual Banquet

The third annual banquet and reunion of the Branch was held at the Empress hotel, on November 14th. The guests of honour included Brig.-Gen. C. H. Mitchell, C.B., C.M.G., D.S.O., B.A.SC., C.E., M.E.I.C., vice-president of *The Institute* and Dean of the Faculty of Applied Science of the University of Toronto, R.A. Ross, D.SC., E.E., M.E.I.C., past president of *The Institute* and prominent consulting engineer, Professor Peter Gillespie, B.A.SC., M.E.I.C., University of Toronto, past councillor of *The Institute*, Alex. J. Grant, M.E.I.C., chief engineer of the Welland canal, J. H. Hunter, M.E.I.C., representing Montreal Branch, Fraser S. Keith, M.E.I.C., general secretary of *The Institute*, as well as representatives of the ministerial, medical, dental, legal and teaching professions.

After due honour had been done to the toast to the King, the branch chairman, P. P. Westbye, M.E.I.C., who presided, welcomed the guests. In his speech Mr. Westbye said the Peterborough Branch felt highly honoured to have such a list of distinguished guests, for example; Brig.-Gen. C. H. Mitchell, whose record in the recent World War and whose reputation as an engineer were well known; R. A. Ross, who has been identified with so many important engineering projects, Professor Gillespie, the fruits of whose efforts in the sphere of science are so well known, and Alex. J. Grant who is in charge of that great Canadian engineering undertaking, the Welland ship canal. These men, he said, who appeared at a distance, by reason of their attainments to be quite above the rest of us, were at close range found to be very human after all — which was the surest evidence of their greatness.

Mr. Westbye spoke of the emblem of *The Institute*, the beaver, saying that these little animals attained their ends by *working together*, and were a good example to engineers in showing the necessity of being good neighbours and friends. He said that the members of the profession looked forward to these annual reunions as a potent means of engendering good feeling. These gatherings had the effect, he said, of stimulating and encouraging the members in their work for the advancement of the profession. At the conclusion of his address of welcome, Mr. Westbye called the roll of the guests, asking each to stand when his name was announced. At this stage of the programme a new engineering song was introduced by the Branch sextette who perform under the name of "The Lyre Birds" (*some spell it in this way*). This song was sung with great zest by all present — whether they could sing or not:—

(Tune: "**Sussex by the Sea**)

Oh we are the engineers — we are the E.I.C.
We work or jest with equal zest
And brothers all are we,
And when you see these letters, wherever you may be
You can tell them all that we stand or fall
For the good old E.I.C.
Then shout out loud for E.I.C.
Be stout and proud of E.I.C.
You can tell them all that we stand or fall
For the good old E.I.C.

The sextette rendered during the evening a number of original topical and community songs which added greatly to the amusement and enjoyment of those present. "The Lyre Birds" who at last year's banquet were known as a "Seven Man Sextette" have this year so adjusted their numbers as to be literally a "sextette". Their personnel is as follows:—W. M. Cruthers, A.M.E.I.C., A. L. Dickieson, A.M.E.I.C., A. B. Gates, A.M.E.I.C., P. Manning, A.M.E.I.C., H. Rose, S.E.I.C., W. E. Ross, Jr.E.I.C. W. H. Barry, who is an affiliate of the Branch, acted as pianist.

The toast to *The Institute* was proposed by the honourary chairman of the Branch, P. L. Alliston, M.E.I.C., who traced the growth of *The Institute* since its founding as the Canadian Society of Civil Engineers in 1887, when its membership was nineteen, to the present day with its membership totalling over five thousand, with twenty-three active Branches scattered across Canada from coast to coast. He said when we consider the influence *The Institute* has and will continue to have in the development of the Dominion we must feel proud and happy indeed to belong to its membership. With the establishment, he said, of the Lakehead Branch at Port Arthur in September, the twenty-third Branch was created. Our member of Council, Ross L. Dobbin, M.E.I.C., was the official representative of *The Institute* there, and in company with the general secretary, Fraser S. Keith, witnessed the birth of this new Branch. In this connection it is interesting to note that the Peterborough Branch which was founded only three years ago, was the thirteenth Branch so we may judge how rapidly *The Institute* is growing. Mr. Allison then spoke of the future of *The Institute*, saying that its growth would be made up in a large measure by the graduates of our colleges and technical schools. It was essential that these institutions should provide a liberal education such as would enable graduates to take their place on an equal footing with members of the other professions.

Brig.-Gen. C. H. Mitchell, M.E.I.C., in replying to this toast, spoke of the importance of Peterborough as one of the engineering centres of the Dominion. It had produced many of the men whose names were associated with some of Canada's greatest projects, from the late Sir Sanford Fleming down to men of our own day, such as Ross, Grant, Fairbairn and others. General Mitchell spoke of the progress that had been made in engineering, citing as an example, the contrast presented by the old G.T.R. locomotives with the giant "moguls" in use to-day. He said that railroad management envolved greater engineering problems than most people imagined, and went on to enumerate certain of these which though they appeared simple still remained unsolved. The solution of these problems was of vast economic importance, and he asked the question, "How is *The Engineering Institute of Canada* going to be a factor in solving these problems?"

General Mitchell here told a story of three stonemasons who were severally asked what they were doing. The first of them replied that he was cutting stone; the second said that he was working for wages; the third answered that he was helping to build a cathedral. General Mitchell said we as engineers should tackle our problems and do our work in the spirit of the stonemason who was "helping to build a cathedral". He said that if the engineers did not attack and solve the pressing problems of to-day that someone else would; business men, financiers and others. He cited a formidable list of problems which were demanding a solution at the present time:—

1. The solution of the economic organization and operation of our National Railways. This is our key problem and its correct solution will solve many more with ease.
2. The economic electrification of steam railways as distinct from the construction of new electric ones.
3. The economics of building new electric interurban and trunk railways alongside of or to feed existing steam roads.
4. Development of permanent highway systems, provincial and national.
5. Profitable long distance electric power transmission. It is now 250 miles, may it be 500 miles or 700 miles in this country?
6. Means of getting cheap electric power delivered to farming communities.
7. The operation of hydro-electric power plants in the very cold climate and frozen rivers of the far north from which with long transmission lines to centres of population we can distribute power to the vast west.
8. Recovery from our low grade ores and wastes from mines.
9. Electric smelting of our iron ores, especially in central Canada, by means of water power at very low costs.
10. Continued intensive exploration, reconnaissance, appraisal and research of our national resources. What more can we learn for instance about the possibilities of: — oil in the great northwest, copper and gold in the central north, diamonds in the clay of northern Ontario, and iron and gold in Labrador?
11. Construction and surfacing of our highways which will stand up under extreme traffic with our winter conditions.
12. The protection of concrete structures from attack by the alkali waters of the western provinces.
13. Development of cheaper motor traction for road, farm and industry.
14. Electric motor cars with light weight inexpensive storage batteries capable of operating over long distances.
15. The construction and operation of aeroplanes for very cold winter conditions.
16. The manufacture of motor fuels, as substitutes for gasoline from agricultural products, such as wood, corn and potatoes.
17. Wireless and radio development — at present only in its infancy.
18. The development of apparatus for using electricity for heating and heat processes in the manufactures (based on very cheap power).
19. Development of uses for our very large nickle resources, as an essentially Canadian metal.
20. The production of nitrogen and its compounds from the air by electric processes with water power, to make Canada independent, especially for refertilizing our western agricultural areas.

These are some of the things which we must set ourselves to solve, as a nation of energetic, alert people and it is clear that engineering plays a most important part and must take its active responsibility in their solution. It is our national duty at this time to look with cheerfulness on the future and to attack these problems with the best possible combination of our human and material resources.

R. A. Ross, M.E.I.C., also spoke responding to the toast to *The Institute*. His address opened in reminiscent vein and he recalled many humourous incidents of earlier days in Peterborough. He followed his prefatory remarks with some sound advice to engineers, saying that their fields of action should be extended beyond merely technical limits. He mentioned the name of Herbert Hoover as an instance of a man whose engineering ability had carried him into other important spheres of service. Mr. Ross intimated that such expansion of the field of the engineer was becoming imperative as a result of the large number of men graduating from the engineering faculties of our universities. If they had "to bludgeon their way into

these jobs" Mr. Ross believed that engineers should do so for the reason that they were especially qualified for them.

At the conclusion of Mr. Ross's speech "The Lyre Birds" again burst forth in song, contributing another original number:—

(Smiles)

Engineers who work on railroads,
Engineers who work on boats,
Engineers who never are seen working,
For whom some other guys are goats,
Engineers who have made a lot of money,
Engineers forever broke like me,
But all the best of them are members
And are proud of the E.I.C.

The toast to the Branches was proposed by Fraser S. Keith, M.E.I.C., who gave an interesting account of the progress being made by *The Institute's* branches which now number twenty-three, and the enthusiasm which they are evincing in *Institute* affairs from one side of the continent to the other. Mr. Keith emphasized the fact that the strength of *The Institute* lay in its Branches and their ever-increasing vitality was a good indication of the future greatness of *The Institute.*

J. H. Hunter, M.E.I.C., rose in response to this toast and conveyed the good wishes of the Montreal Branch. He spoke of the growth of that Branch, and showed how, by concerted efforts on the part of its officers in increasing its membership, its development had been phenomenal. The meetings, he said, were always well attended and it would not be long before it would be necessary to call them more frequently.

Professor Peter Gillespie, M.E.I.C., responded also to this toast, conveyed the felicitations of the Toronto Branch, and, as usual, found the Peterborough Branch a highly appreciative audience for his excellent address.

The chairman called upon Alex. J. Grant, M.E.I.C., of St. Catharines, who spoke of the Welland ship canal. E. L. Miles, M.E.I.C., of Lindsay, Ont., who is county engineer for Victoria county, also spoke.

The toast to the Sister Professions was proposed by A. L. Killaly, M.E.I.C., who said how much the Peterborough Branch appreciated having representatives of the ministerial, medical, dental, legal and teaching professions with them on this occasion.

The Rev. Robert Pogue replied for the Ministerial Association, Dr. Edward Wood for the Medical Association, Dr. J. J. Craig for the Dental Association, Mr Strickland for the Law Society, and R. F. Downey for the Teachers' Institute. Mr. Downey made a very brilliant speech, the theme of which was that whatever might be the heights of fame to which engineers might rise, they owed their beginnings to the "little red school house".

There was now presented what was announced as a "Scientific Demonstration" with H. Rose as "chief demonstrator". The apparatus used in this demonstration consisted of a unique and quite original radio set, the product of the fertile brains of some of the engineers of the Canadian General Electric Company. Some of the news "picked up" during the demonstration was specially interesting to members of the Branch.

The singing of "God Save The King" concluded one of the most successful gatherings of the engineers of the Peterborough Branch.

OTHER SOCIETIES NEWS

Canadian Engineering Standards Association

The semi-annual meeting of the Main Committee of this association was held November 13th, in Ottawa, at the offices of the association, H. H. Vaughan, M.E.I.C., in the chair. After the transaction of formal business, the secretary reported that the membership of the association as of October 1st was 285, all members taking part in the work of various active committees of the association.

Progress reports of the various working committees were presented, and it was announced that the specifications for steel highway bridges; incandescent lamps; watthour meters; wood poles for transmission lines; flexible wire rope and strand for aircraft; and commercial bar steel are well advanced or are ready for publication, that for steel highway bridges being in the press. The specification for flexible wire rope and strand for aircraft was approved for publication. In conformity with a request from the Secretary of State's Department, a formal resolution was passed changing the location of the head office of the association from Montreal to Ottawa. The secretary's report on the activities of the association during the past six months was received and approved.

The personnel of a Sectional Committee on Road Materials and Construction under the chairmanship of A. W. Campbell, M.E.I.C., Dominion Commissioner of Highways, was approved, this committee including representatives of all the provincial highway authorities and having as its principal object the obtaining of

Dominion-wide agreement on nomenclature, definitions and tests for road materials; and co-operating with the Committee on Road Construction recently appointed by *The Engineering Institute of Canada.*

A request having been received from the American Engineering Standards Committee for co-operation in unifying divergent local requirements for traffic signals on highways, it was decided to request the highway departments of the nine provincial governments, the Board of Railway Commissioners, the Canadian Automobile Association and other bodies interested in automobile work, the larger cities of the Dominion, *The Engineering Institute of Canada*, and the railway authorities to nominate members on this committee. The functions of this committee will be to make a survey of present conditions in Canada, prepare recommendations accordingly, and consider these in connection with the draft suggestions to be prepared in the United States and forwarded by the American Engineering Standards Committee. It was decided to take similar action in connection with a request for the association's co-operation in connection with specifications for electric overhead crossings, the organizations interested in this case being the Board of Railway Commissioners, the steam and electric railway authorities, the power companies, and various power commissions, the provincial governments, and the various telegraph and telephone companies.

A suggestion from the Sub-Committee on Concrete and Reinforced Concrete that action should be taken looking to the preparation of specifications for reinforced concrete poles was approved.

The secretary reported that a number of favourable and some unfavourable replies had been received to the invitation sent out by the Honourable Mr. Robb, Minister of Trade and Commerce, for an interprovincial conference to be held under the auspices of the association regarding the possibility of obtaining Dominion-wide agreement as to requirements for the design, inspection and installation of electric fittings, appliances and equipment, and it was hoped that the conference in question would shortly be held. It was announced that the grant to the association from the Dominion Government has been continued for the fiscal year 1922-23, and other contributions to the funds of the association were reported. The auditor's statement and balance sheet as of October 1st, was received and approved.

British Engineering Standards Association

The British Engineering Standards Association has issued the following British Standard Specifications within the past few months.

B.S.S. No. 7-1919; a revision of the July 1919 edition, of specification for Dimensions of Insulated Annealed Copper Conductors for Electric Power and Light including Pressure Tests.

B.S.S., No. 137-1922; for Porcelain Insulators for Overhead Power Lines (3,000-150,000 volts).

B.S.S., No. 138-1922; for Materials and constructional strength of Chemical Fire Extinguishers.

B.S.S., No. 143-1922; for Long Sweep Type Malleable Iron Pipe Fittings for Steam, Water and Gas.

B.S.S., No. 152-1922; for Dimensions in Metric Measure of Insulated Annealed Copper Conductors for Electric Power and Light, including Pressure Tests.

B.S.S., No. 153-192; for Girder Bridges. Part 1, Materials; part 2, Workmanship.

B.S.S., No. 154-1922; for Malleable and Soft Cast Iron Pipe Fittings for Steam, Water and Gas.

Society of Chemical Industry

Domestic fuel problems were discussed at the first meeting of the season of the Ottawa section of the Society of Chemical Industry held in the Daffodil Tea Rooms on November 9th. It was brought out that much of the difficulty experienced in burning peat in hot water furnaces was due to the fact that too much fuel was thrown, thereby checking the long flames which emit the heat. F. B. Hambly was chairman and invited a discussion on the papers. A. E. MacRae, A.M.E.I.C., was secretary.

Mr. Hambly showed that to burn one pound of coal required 10 pounds, or 120 cubic feet of air, thus an average furnace theoretically uses 12,000, cubic feet of air daily and on the regulation of the air supply depends the success of the furnace operation. Too much air carries much heat up the chimney. The topic of the evening was "Characteristics of Different Types of Fuel and Furnaces". The first part of the programme was handled by Messrs. R. E. Gilmore, J. H. H. Nicolls and H. Kohl, superintendent and engineering chemists respectively of the Government Fuel Testing Laboratory, and the second part by E. S. Malloch, A.M.E.I.C., engineer of Fuels and Fuel Testing Division of the Department of Mines.

The subject of household fuels was divided into three parts, viz., (a) the relative value of chemical and physical analysis of coal and other fuels, (b) the classification of the higher types of fuels, and (c) the ignition temperature of different fuels.

National Exposition of Power and Mechanical Engineering

The National Exposition of Power and Mechanical Engineering will open at 1.00 p.m. on Thursday, December 7th, 1922, at the Grand Central Palace. It will immediately follow the Annual Meetings of the American Society of Mechanical Engineers and the American Society of Refrigerating Engineers and will remain open until December 13th, except on the intervening Sunday.

This Exposition will be the first large scale attempt to display mechanical and power plant apparatus so that the present extraordinary state of development will be apparent not only to the highly trained technical man but to the layman with little knowledge of the severe problems involved in the engineering design and operation of combustion apparatus and power-generating machinery.

The development of the power station itself will be illustrated by the exhibition of a series of models of the important central stations in New York City. The original station erected by Thomas Edison in Pearl Street will appear beside the more modern Waterside Stations and the recent Hell Gate Station. The representation of this latter station is a faithfull reproduction built to a scale of one-quarter of an inch to the foot. In addition to the public central stations mentioned above it is planned to show a model of one of the well known large industrial power plants. To further enhance the educational and informative value of the exposition each of the exhibitors will demonstrate the fundamentals

underlying the operation of their apparatus by simulating actual operating conditions as nearly as possible in their exhibits. If practical apparatus will be shown in motion, otherwise complete diagrams will be displayed.

The Engineering Division of the National Research Council

The Division of Engineering of the National Research Council of the United States has just issued a booklet giving much information about its organization, work and personnel. The National Research Council is a co-operative organization of American societies and scientific men concerned with the physical, mathematical and biological sciences, and the applications to human welfare through the agricultural, engineering and medical arts. Approximately eighty societies are included. Among the Council's members are also business men interested in the industries. The main offices of the National Research Council are at 1701 Massachusetts Avenue, Washington, D.C., pending the completion of its permanent building near the Lincoln Memorial. The Division of Engineering has offices in Engineering Societies Building, 29 West 39th Street, New York, in order to facilitate co-operation with the engineering societies and Engineering Foundation.

Copies of the pamphlet and other information will gladly be sent upon request, addressed to Alfred D. Flinn, Chairman, or William Spraragen, Secretary, 29 West 39th Street, New York.

Publications

Machinists' and Draftsmen's Handbook by Peder Hobben. The third edition of this reference book has just been published by D. Van Nostrand Company, New York, and in addition to the large amount of conveniently arranged data, given in the previous editions, it embodies revisions in the steam and electrical sections to conform with the most recent practices. The book is designed as a ready practical reference book for those interested in mechanical work, and contains tables, rules, and formulas, with just sufficient explanation and examples to give an understanding of the principles applied. The first part is devoted to mathematics, with sections on arithmetic, algebra, logarithms, weights and measures, geometry and mensuration. This is followed by sections of strength of materials, mechanics, belts, rope transmission, pulleys, fly-wheels, shafting, bearings, gear teeth, screws and pipes, while six short sections at the end contain notes on hydraulics, steam, copper wire, electrical terms and blue printing, with a short general section on shop notes.

Mechanical Laboratory Methods. — A reference book for the testing of instruments and machines in the mechanical engineering laboratory and in practice, by Julian C. Smallwood, M.E., has been recently published by D. Van Nostrand Company, New York. This book is divided into three sections, the first dealing with the testing of instruments, such as weight and forces, pressure, angular velocity, etc.; the second deals with the analysis of combustion as constituents of fuels, heat value of fuels and products of combustion; the third section touches on the various items of a power plant. It also includes tables of logarithms, densities of water, steam-vapour tension tables, properties of steam, Mollier diagram, properties of ammonia, hygrometry, total heat of air steam mixtures, and the American Society of Mechanical Engineers code on definitions and values.

Canadian Highways and Roads. — The Highways Branch of the Department of Railways and Canals, of which A. W. Campbell, M.E.I.C., is chief commissioner, has just issued a most interesting pamphlet giving general information regarding highways, which is entitled, "Bulletin no. 1, Canadian Highway and Roads" and may be secured on application to the department.

CORRESPONDENCE

Concrete Proportioning Theories Discussed

November 8th, 1922.
8 Strachan Avenue,
Toronto.

Editor, *Journal*:—

Dear Sir:—

I cannot let pass without comment, Prof. G. M. Williams', A.M.E.I.C., paper, "Some Fallacies in Concrete Proportioning Theories", which appeared in your issue of September. The assertions he makes there are not new but because of the dogmatic way in which his statements are presented, they would lead one to believe that the claims he has made are established facts. This is far from being the case.

In June 1918, Mr. L. N. Edwards, then with the City of Toronto, presented his method of Proportioning the Materials of Mortars and Concretes by Surface Area of Aggregates. In December of the same year, Prof. Duff A. Abrams M.E.I.C. of the Lewis Institute, Chicago, brought out another method of proportioning concretes based on fineness modulus and on what is now known as the water-cement ratio theory. In July 1919, Prof. Williams and Mr. Watson Davis, both of whom were then connected with the Bureau of Standards, Washington, D.C., published an article in which they criticized strongly both the conclusions and test data of these two methods. Supporting their claims were the results of tests made by themselves. These criticisms were answered by Messrs. Edwards and Abrams and commented upon by others. Since then other papers on the subject of these theories have been published but without much new information on the subject appearing.

I will not attempt to review the details of this controversy or to express any opinions on its merits, but I will call attention to the fact that Prof. Williams is the only critic to come forward and condemn in their every feature both methods of proportioning, to express doubt as to the authenticity of the data on which they are based and to claim that sound principles of testing were violated in obtaining this data and that the frequent references by Prof. Williams to published articles as supporting his opinions are without exception to articles written by himself and the tests referred to are tests made by him and his associates.

The criticisms which have been made by Prof. Williams have been answered by both Mr. Edwards and Prof. Abrams and their replies are fully as convincing to the average reader as are the former's arguments and criticisms. With the exception of the fact that neither Mr. Edwards nor Prof. Abrams used the flow table in their early tests, the methods pursued by them are those recognized to-day amongst testing engineers as "sound in principle", while consideration of their writings does not lead one to the conclusion that they were not fully conversant with and had a proper appreciation of the fundamentals of testing.

The Hydro-Electric Power Commission of Ontario with which the writer is connected has been successfully using methods of proportioning based in part on the theories of both Messrs. Abrams and Edwards. Consequently we have become involved occasionally in the controversy which has resulted from Prof. Williams' attacks upon them. Replying to one of these directed at an article describing the successful application of the methods used by the Commission, Engineering News-Record, March 17th, 1921, the writer said in part: "We hold no brief for either the surface area or water-cement theories. There are data which cannot be explained by either and which are apparently in direct contradiction thereto but there are also data which support them and which cannot be ignored. We have never claimed them as general in their application but, used as we have used them, they form valuable tools by which proportions can be more accurately set than by any scheme of equal simplicity yet developed. We fully expect them to be superseded at some future time when our knowledge of concrete has broadened but until such time arrives and a better tool is found, they should not be utterly condemned."

We have not altered our views since that time although we have had the theories in question under examination in the laboratory and have used them in proportioning some 400,000 cubic yards of concrete on the Queenston-Chippewa development.

The writer's experience with the flow table has not led him to the conclusion that it has "fully demonstrated its ability to accurately measure the consistency of concretes varying widely in cement content and aggregate gradations". The apparatus has been used for about two years in the laboratories of the Hydro-Electric Power Commission of Ontario and the experience there has been that while it is an improvement over other tests for consistency which has been tried, it still leaves much to be desired. It has many of the faults of the slump test but to a less degree and the range of mixes and gradations over which it can be used is greater. It is hardly right to say that it has been standardized as work with this purpose in view is, we understand, now in progress in the Bureau of Standards, where the flow table was first developed.

R. B. YOUNG, A.M.E.I.C.,
Assistant Laboratory Engineer,
Hydro-Electric Power Commission of Ontario.

Specifications for Belgium Railway Contracts

Consulat de Belgique
Montreal, November 22nd, 1922.

Editor, *Journal:*—

Dear Sir,

I beg to inform you that the Department of Railways, Marine, Posts and Telegraphs from Belgium has sent to this Consular office the specification books concerning the supplying, in 1923, of railway ties and special squared timbers of various dimensions, in oak and beech, for switchers, turnouts, etc.

These publications can be consulted in this Consular office and will probably be interesting to Canadian merchants desiring to send in tenders.

I would be very much obliged to you to attract their attention on the foregoing. Thanking you in anticipation, I beg to remain, gentlemen,

Yours very truly,
JOHN VAN RICKSTAL,
Consul.

Trade Publications

The Taylor Stoker is the name of a very handsomely prepared booklet, published by the American Engineering Company of Philadelphia, Pa., and distributed locally through the Taylor Stoker Company, Limited, of Toronto and Montreal. This publication contains a large number of illustrations of plants in which the Taylor Stoker is installed, together with a brief description in each case of the type of equipment used.

B. F. Sturtevant Company, Hyde Park, Boston, Mass., have recently distributed their catalogue No. 295, describing and illustrating Sturtevant Air Washers. In it are included details of performances and dimensions, and a number of tables of relative humidity, grains of moisture per cubic foot, dew point temperatures, weight of saturated air per cubic foot for dry and wet bulb temperatures of the sling psychrometer. Copies of this catalogue may be secured upon request.

Current Meters for use in River Gauging. A Committee on Gauging Rivers and Tidal Currents has been appointed by the Department of Scientific and Industrial Research to collect information relating to methods and appliances used in investigations bearing upon measurements of river, tidal and other currents and to the testing and standardization of such apparatus, and to test appliances that appear to be suitable for use in the study of the water power resources of this country. Under the direction of this Committee a report has been prepared which summarizes the information available as to the conditions affecting the design and use of current meters, and gives a description of the types now in use. The report is accompanied by a brief bibliography of the literature of current meters.

Mechanical Devices for Loading and Unloading Motor Vehicles to reduce Terminal Delays. A small illustrated pamphlet by W. D. Williamson, has been published by the authority of the Institution of Automobile Engineers, Westminster, S.W., and contains descriptions of devices of various designs for the mechanical handling of the loads of motor vehicles. The subject is treated under two principal headings: loading devices and unloading devices; the former type being described under three subheading: interchangeable bodies, mechanical devices at the loading station, and mechanical devices on the vehicle itself. Special reference is made to the handling of liquids, a system for municipal work, and filling coal at a large colliery. while some interesting data relative to the running cost of a 4-ton lorry is also given. All equipment referred to in the pamphlet is illustrated either by drawings or actual photographs.

Ingersoll-Rand Products. — The most recent catalogue of the products of the Canadian Ingersoll-Rand Company has recently been published and is prepared in a very convenient loose-leaf style with appropriate cover in order that the data contained therein may be kept up to date. This volume together with bulletins numbers K-701 and K-702 and number 3045-C which have also recently been published, are available to the members of the Institute on request.

Preliminary Notice

of Applications for Admission and for Transfer

20 November, 1922

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in December, 1922.

FRASER S. KEITH, Secretary.

*The professional requirements are as follows:—

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option, Railway, Municipal, Hydraulic, Mechanical, Mining or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects, Geography, History (that of Canada in particular), Arithmetic, Geometry, Euclid (Books I.-IV. and VI) Trigonometry, Algebra up to and including quadratic equations

Every candidate for election as ASSOCIATE shall be one who by his pursuits scientific acquirements ,or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge

> The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members

FOR ADMISSION

[illegible] WILLIAM, of Bank Str. Chambers, Ottawa. Born [illegible], England, Dec. 25th, 1871. Educ., Miners Inst., [illegible] apprt'ce., mech., engr'g., [illegible] yrs. gen'l engr'g. Walker Bros., Ltd., [illegible] the shop [illegible] Builders Manu [illegible] Canada Foundry, since 1913, distr. sales engr., Canadian Crocker Wheeler Co., Ltd., St. Catharines, Ont.

FOR TRANSFER FROM CLASS OF JUNIOR TO HIGHER GRADE

HENDERSON—JOHN ARCHIBALD HAMILTON, of 87 Cartier Str., Ottawa, Ont. Born at Smiths Falls, Ont., April 19th, 1895. Educ., B.Sc., Queen's Univ., '22; 1912-16, with Geodetic Survey as follows—1912, rodman and recorder, precise levelling, 1913, Ottawa vicinity survey, levelling, triangulation, photography, plane table, 1914, asst. primary triangulation, 1915, baseline measurement and asst. primary triangulation, 1916, asst. primary triangulltion; 1917-19, overseas, Can. Engrs., B.E.F., France; 1920, in chg. reconnaissance, primary triangulation Saguenay River, 1921, observer, primary triangulation, British Columbia, and 1922, observer, primary triangulation B.C., for Geodetic Survey of Canada, Ottawa, Ont.

References: N. Ogilvie, G. A. Mountain, W. P. Wilgar, J. B. McRae, A. MacPhail, J. L. Rannie.

MICHELL—HUMPHREY GEORGE, of 152 Sevenoaks Ave., West Kildonan, Man. Born at Miniota, Man., Oct. 1st, 1894. Educ., B.Sc., (E.E.), Univ. of Manitoba, '20; 1913, (5 mos.), rodman location survey, G.T.P. Rly.; 1914 (3 mos.), elec. constrn., Manitoba Rolling Mills, Selkirk, Man.; 1916-19, overseas; 1919 to date with Winnipeg Hydro-Electric System as follows:— 1919 (June-Sept.), asst. operator; 1920-22, engag'd. testing and inspectn. overhead and underground lines, transformers, etc., survey and mapping of distribution system, on engineering staff; to date, distribution engr., designing and estimating, etc.

References: E. V. Caton, C. A. Clendenning, N. M. Hall, E. P. Fetherstonhaugh, J. W. Sanger.

MOORE—ULRIC ROBERT, of 257 Bridge Str., Niagara Falls, Ont. Born at Toronto, Ont., Sept. 27th, 1892. Educ., Grad. Tech. School, pvte. tuition, special course in surveying and engr'g., Toronto, and I.C.S. railroad éngr'g.; 1911 and '12, (summers) on location as rodman and leveller, and constrn., as rodman and instr'man., C.P.R.; 1913, asst. res. engr., constrn., C.P.R.; 1914-16, ch. dftsman., section 5, Welland Ship Canal; 1916-17, A/ office engr., and A/asst. engr.; 1917-19, Imperial Munitions Board, adjustor of claims, Ottawa; 1919-20, cost accountant, Tractor Corporation; 1920-21, asst. engr., design'g. dept., Toronto Harbor Commn.; 1921 to date, instr'man., divn. 4, power house constrn., Hydro-Electric Power Commission, Niagara Falls, Ont.

References: W. H. Sullivan, E. L. Cousins, G. T. Clark, W. Jackson, A. C. D. Blanchard, O. Holden, J. A. Hesketh.

THURBER—GEORGE HENRY, of St. John, N.B. Born at Harcourt, N.B., Feb. 25th, 1892; Educ., Nova Scotia Tech. Coll., '11; 1907 (one month), assisted in wiring and install'g. elec. lighting plant, in mfg. plant; 1910 (Aug.-Sept.), student asst., conducted 3 small surveys and made plans of same; 1911 to date, junr. engr., making surveys, plans,designs, estimates and reports on dredging and harbour works,inspecting and supervising constrn. of same, 1912-13, channel dredging, N. W. Miramichi River, 1913-14, constrn. of wharf at Little Lameque, N.B., 1913, hydrographic survey, Miscon Gully, N.B., 1914, hydrographic surveys N.W. and S.W. Miramichi Rivers, 1921-22, investigations with a view to establishing low-water datum, Miramichi River, Dept. of Public Works, Canada, St. John, N.B.

References: G. Stead, F. G. Goodspeed, G. E. Martin, H. F. Bennett, F. M. Dawson, K. G. Chisholm, G. S. Stairs.

WHITMAN—CLYDE OLIVER, of 772 St. Urbain Str., Montreal, Que. Born at New Albany, Annapolis Co., N.S., May 14th, 1889. Educ., B.Sc., N.S. Tech. Coll., '21; 1910-14, rodman and inspectr., maintenance dept., C.P.R., Lake Superior Divn.; 1916 (summer), instr'man., preliminary survey, Cape Split Hydro electric project, Bay of Fundy, N.S.; 1917-19, instr'man., Algoma Steel Corpn., Sault Ste. Marie, Ont.; 1920 (May-Sept.), asst. res'. engr., constrn. St. Margaret's Bay hydro-electric development, N.S.; 1921-22, on valuation N.S. Tramways and Power Co's. property, with Jackson and Moreland, Boston, Mass.; at present, asst. master, Baron Byng High School, 1251 St. Urbain Str., Montreal, Que.

References: F. R. Faulkner, B. E. Barnhill, N. L. Somers, W. W. Benny, C. H. Mitchell, R. A. Spencer, A. Sutherland, W. G. Hardy.

FOR TRANSFER FROM CLASS OF STUDENT TO HIGHER GRADE

DUGUID—ARCHER FORTESCUE, of Ottawa, Ont. Born at Bourtie, Aberdeenshire, Scotland, Aug. 1st, 1887. Educ., B.Sc., McGill Univ., '12 and Fettes College, Edinburgh, Scotland; 1908 (summer), chainman, G.T.P. constrn. on main line, Prince Rupert, B.C.; 1909 (summer), rodman, G.T.P. location, Biggar-Battleford, Sask., branch line; 1910, passed War Office exam. for univ. candidates for the British Army; 1912-14, Canadian Northern Mackenzie and Mann Montreal Tunnel and Terminal Co., Ltd.,— May-Sept./12, rodman, constrn. C.N.R. tunnel through Mount Royal, Sept.-Nov., levelman, Nov./12-Dec./13, transitman, Dec.-Aug./14, in chg. field, survey parties, responsible for all survey work; 1914-15, Lieut. C.F.A., France; 1915-16, Capt. C.F.A., England and France; 1916-17, A/Major, C.F.A., France; 1917-18, Brigade Major, 2nd Can. Divn. Arty. France; 1914-18, engaged in writing the history of the Canadian Forces in the Great War; 1918-19, General Staff Officer, grade 2, 3rd Can. Divn., France; 1919-21, on staff of Can. War Narrative Section, France, England and Canada; 1921 to date, Colonel on staff, Director of the Historical Section, General Staff, Militia Headquarters, Ottawa, Ont.

References: J. C. Kemp, E. Brown, J. L. Busfield, A. S. Dawes, H. F. H. Hertzberg, E. P. Fetherstonhaugh, H. M. MacKay, A. G. L. McNaughton, J. L. R. Parsons, K. M. Cameron.

FOX—EDWARD CECIL EVANS, of Toronto, Ont. Born at Coaticook, Que., Nov. 29th, 1899. Educ., Diploma (Mech. Engr.), I.C.S., '22; Lieut. in chg. no. 4, Section, 8th Field Company, Canadian Engrs., Toronto; 1918-20, appr'tce. engr., machine shop, inspecting office and engr'g. dept., Can. Ingersoll Rand, Sherbrooke, Que.; 1920-22, asst. to res. engr., on rly. location and constrn., Quebec Central Rly.; 1922, (Jan.-May), asst. and dftsman., A. R. Denison, C.E., archt'l. engr., Toronto, Ont.; May 1922 to date, dftsman., structural steel, bridges etc., McGregor and McIntyre, Toronto, Ont.

References: J. W. Harkom, E. T. Bridges, A. R. Robertson, E. C. Kirkpatrick, W. A. M. Cook.

NARRAWAY—ATHOS MAXWELL, of Ottawa, Ont. Born at Ottawa, Ont., July 19th, 1888. Educ., B.Sc., McGill Univ., '10; one year rly. constrn. dftsman., rodman and chainman, one year steel constrn.; 1910, articled pupil, Dom. and Ont. Land Surveys; 1911-12, D.L.S. commn., asst. Dom. Land Baseline Survey; 1913-15, ch. of party, Inspection Surveys; 1917 to date, Controller of Surveys, chg. of all field work for Topographical Surveys Branch, Dept. of the Interior, chg. Division Land Classification Surveys, chg. relief maps constrn., chg. soils testing laboratory.

References: T. Shanks, N. J. Ogilvie, G. H. Blanchet, F. H. Peters, G. B. Dodge, F. V. Seibert, J. E. N. Cauchon.

PYBUS—RALPH CARR, of 124 Matheson Ave., Winnipeg, Man. Born at Winnipeg, April 13th, 1900. Educ., B.Sc., (C.E.), Univ. of Manitoba, '22; 1919 (May-Oct.) Manitoba Good Roads, Munic. of Springfield; 1920 (May-Oct.), dftsman, G.T.P. Rly., Winnipeg Office; 1921 (May-Oct.), instr'man., and in chg. of road constrn., Manitoba Good Roads, Munic. of Springfield; 1922 (May-Sept.), dftsman. and inspectr. and in chg., during absence of distr. engr., work covering design and reinforced inspectn. concrete bldgs., C. A. P. Turner Co., consltg. engrs., Winnipeg, Man.; at present demonstrator in civil engr'g., Univ. of Manitoba, Winnipeg, Man.

References: J. N. Finlayson, P. I. Baker, E. P. Fetherstonhaugh, N. M. Hall, C. F. Cameron.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print up to 11 by 14 in. size 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to
Harrison W. Craver, Director
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N.Y.

A

ABRASIVE WHEELS

SELECTION OF. The Proper Selection of Grinding Wheels, P. N. Cooke. Can. Machy., vol. 26, no. 15, Oct. 13, 1921, pp. 25-28. Development and advan- [illegible]

ACCOUNTING

[illegible] eers, Arthur L. Mullergren. Eng. News-Rec., vol. 87, no 17, Oct. 27, 1921 pp. 685-687, 3 figs. Arguments for keeping books with segregated costs. Details of looseleaf system. Forms for expense vouchers and time distri- [illegible]

[illegible]

[illegible]

AIR CONDITIONING

[illegible] no. 2910, Oct. 7, 1921, pp. 518-519, 20 figs. partly on supp. plate. Describes [illegible]

AIRCRAFT CONSTRUCTION MATERIALS

SPRUCE. Investigation of Crushing Strength of Spruce at Varying Angles of Grain. Air Service Information Circular, vol. 3, no. 259, July 15, 1921, 15 pp. 10 figs. For determination of crushing or compressive strength from 0 to 90 deg.

AIRPLANE ENGINES

DEVELOPMENTS. Aero Engines, Alan E. L. [illegible] no. 3591, Sept. 16, 1921, pp. 725-740, 2 figs. Discusses thermodynamical, mechanical and metallurgical progress made in construction of aeroengines; stratified working, regeneration, bearing loadings and load factors, two-cycle engines, etc.

ALLOY STEELS

CARBON AND [illegible] Steels: Their Selection and Use, P. W. [illegible] Practical Eng., vol. 64, no. [illegible] Sept. 15, 1921, p. 167.

HARDENING. The Hardening of Tool Steel, S. N. Brayshaw. Eng. Production, vol. 3, no. 57, Nov. 3, 1921, p. 415. Results of work carried out by means of test bars and test cutters for purpose of determining effect of various annealings or heat treatments. (Abstract). Paper read before Sheffield Assn. Metallurgists & Metallurgical Chemists.

HIGH-RESISTANCE. Non-Magnetic, Flame-, Acid-and Rust-Resisting Steel. Chem. & Met. Eng., vol. 25, no. 17, Oct. 26, 1921, pp. 797-799, 5 figs. New high alloy steels developed in research laboratory of Crucible Steel Co. which can easily be worked and machined, but after heat-treatment become hard and resistant to attack of all agents.

ALUMINUM

PROPERTIES AND ALLOYS. Aluminum, Its Production, Properties and Alloys (L'aluminium, sa fabrication, ses propriétés, ses alliages), Léon Guillet. Revue de Métallurgie, vol. 18, no. 8, August 1921, pp. 461-526, 70 figs. Report of lecture at recent aluminum exposition. Appendixes giving curves for binary alloys. Bibliography.

ALUMINUM ALLOYS

AUTOMOBILE CONSTRUCTION. Use of Wrought Aluminum Alloys in Automobile Construction, Walter Rosenhain. Automotive Industries, vol, 45, no. 18, Nov. 3, 1921, pp. 862-864. Discusses advantages and possible applications, piston difficulties, corrosion.

BRONZES. Notes on Casting Aluminum Bronze, Austin D. Wilson, Foundry, vol. 49, no. 20, Oct. 15, 1921, pp. 801-804, 27 figs. Micrographs illustrate effects of different composition and heat treatments on structure. Presence of manganese tends to refine grain.

CASTINGS, CRACKS IN. Cracks in Aluminum-alloy Castings, Robert J. Anderson. Trans. Am. Inst. Min. & Metallurgical Engrs., no. 1104-N, Oct. 1921, 22 pp also (in abstract) Min. & Metallurgy, no. 168, Oct. 1921, pp. 43-44. Effects of various factors on cracking; method of molding; prevention of cracks.

See also Aluminum, [illegible]

ANEMOMETERS

TESTING. Measurement of Air Velocities and the testing of Anemometers, James Cooper. Iron & Coal Trades Rev., vol. 103, no 2798, Oct. 14, 1921, p. 540. Discusses results obtained with a testing anemometer table based on that designed by H. Briggs many years ago and which is claimed to work perfectly.

ASH HANDLING

CONVEYOR. A new Ash Handling Conveyor. Eng. & Indus. Management, vol. [illegible] developed by Underfeed Stroker Co., Ltd., London.

AUTOMOBILE ENGINES

[illegible] How Ford Cylinder Blocks are Cast, Pat. Dwyer. Foundry, vol. 49, no. 19, Oct. 1, 1921, pp. 751-758, 7 figs. New River Rouge plant operated on continuous production principle; to make castings for 8,000 cars per day. Description of making cores, molds, pouring castings, melting equipment, etc.

[illegible] cylindres en ligne), A. Contet. La Vie Automobile, vol. 17, no. 738, Sept. 25, 1921, pp. 335-339, 12 figs. Discusses variations of eight-cylinder crankshafts and describes Panhard, Fraschini and other eight-cylinder engines.

AUTOMOBILE FUELS

COKE. Coke As a Fuel for Commercial Vehicles, Thomas Clarkson. Engineering, vol. 112, no. 2912, Oct. 21, 1921, pp. 579-580. Points out that when coke is used a motor fuel, either for raising steam or making gas, cost of transport may be very considerably reduced as compared with gasoline motor. Paper read before Instn. Automobile Engrs.

AUTOMOBILES

CAMSHAFTS. Manufacture of Accurate Camshafts, Edward K. Hammond. Machy. (N. Y.), vol. 28, no. 3, Nov. 1921, pp. 175-180, 8 figs. party on p. 181. Describes important operations, and gives complete tabulated data on manufacturing procedure in making camshafts in Lincoln Motor Co's plant.

[illegible] 1921, pp. 7-11, 2 figs. [illegible] speeds, elastic constants of springs.

AVIATION

[illegible] 17 [illegible] 17 and [illegible]

B

BALLOONS

[illegible] speed of bringing down the balloon, winding cable, etc.

BEAMS

Continuous. Calculations for Continuous Beams with Third-Point Loading, Ewart S. Andrews. Concrete & Constructional Eng., vol. 16, no. 10, Oct. 1921, pp. [illegible] Mech. World. vol. 70, no. 1813, Sept. 30, 1921, pp. 266-267, 7 figs. Discusses Clapeyron's theorem of three moments.

Curved. Bending Lines of Curved Beams (Biegungslinien ringförmiger Trager), Friedrich Düsterbehn. Eisenbau, vol. 12 no. 10, Oct. 11, 1921, pp. 294-264 7 figs. Bending lines are developed for deformation of curved beams.

Sections. [illegible] Section, Alan Pollard. Machinery (Lond.)vol. 19, no. 473, Oct. 20, 1921, pp. 63-66, 4 figs. Method for determining the centroid, moment of inertia, swing radius, and moduli for any shape of section on drawing board.

BEARING METALS

Properties. What Metals Serve Best in Bearings-, Bruno Simmersbach. Raw Material, vol. 4, no. 9, Sept 1921, pp. 316-320. Relation between physical-chemical properties of bearing alloys and their ability to live under strenuous duty. [illegible] Zeitung.

BEARINGS, BALL

Roller and. Anti-Friction Bearings in the Steel Mill, A. M. MacCutcheon. Blast Furnace & Steel Plant, vol. 9, no. 10, Oct. 1921, pp. 600- 607, 13 figs. Discusses ball and boiler bearings, their manufacture, mounting and selection. Advantages and disadvantages of anti-friction bearings. (Abstract). Paper read before Iron & Steel Elec. Engrs.

BEARINGS, ROLLER

Tangential Load. Experiments with Roller Bearings Under Tangential Load (Undersökningar rörande rullning under tangentialkraft), Arvid Palmgren. Teknisk Tidskrift (Mekanik), vol. 51, no 9, Sept. 14, 1921, pp. 129-132, 8 figs. [illegible]

BELTING

[illegible] H Rudeloff. Zeit. des Vereines deutscher Ingenieure, vol. 65, no. 40, Oct. 1921, pp. 1041-1044, 4 figs. Account of test to determine strength of paper [illegible] of manufacture, for purpose of ascertaining degree to which strength of cellulose employed in yarns, textures and belts is utilized.

Rubber. Getting the Maximum Service in Rubber Transmission Belting, James B. McPherson. Chem. & Eng. News, vol. 33, no. 10 Oct. 1921, pp. 29-30. Writer advises securing maximum coefficient of friction, maximum arc of contact practicable, avoiding excessive tension, reckless use of dressings, and [illegible]

BLAST-FURNACE GAS

Steam Power from. Steam Power from Blast-Furnace Gas, Gordon Fox and F [illegible] 15, 1921, pp. 7[illegible], 3 figs. Resumé on utilization of blast-furnace gas for steam making and development in burning gas alone or in combinations with other fuels. Typical data are given [illegible] supply. Importance of clean-[illegible] are cited and developments [illegible]

BLAST FURNACES

High Top Heat. Causes of High Top Heat in the Blast Furnace, Wallace G. Imhoff. [illegible] Chart record-[illegible] are of value in controlling furnace operations, [illegible]

BOILER FEEDWATER

Concentration, Control of. Priming and Control. of Boiler Water Concentration, Geo. C. Cook. Power Plant Eng., vol. 25. no. 20, Oct. 15, 1921, pp. 986-988. Discusses limit of impurities in feedwater and methods of controling degree of concentration.

BOILER FIRING

Fuel Saving in. Fuel Saving in Relation to Capital Necessary, Joseph Harrington. Mech. Eng., vol. 43 no. 11, Nov. 1921, pp. 725-726, 2 figs. Investigation shows economy resulting from use of efficiency equipment. Concrete illustrations [illegible] support [illegible] Abstract.

BOILER PLANTS

Efficient Operation. Boiler-Plant Efficiency, Victor J. Azbe. Mech. Eng., vol. 43. no. 11, Nov. 1921, pp. 722-724 and 726, 5 figs. Usual wastes in boiler plants are brought out by means of tables and curves of boiler performance compiled from large number of observations. Shows to what extent these wastes are preventable or can be made to balance each other, and recommends standard for boiler operation toward which designers and operators may aim. Requirements of ideal boiler installation are summarized.

BOILERS

Design and Settings. Boiler Equipment at River Rouge Plant of the Ford Motor Company, George T. Ladd. Proc. Engineers' Soc. of Western Pa., vol. 37. no. 3 April 1921, pp. 115-148 and (discussion) 149-157, 17 figs. Discussions design of boilers and settings. Discussion of powdered coal equipment and superheater equipment by H. D. Savage and J. R. Le Vally, respectively.

Flanging Methods. Special Methods of Boiler Flanging, George A. Richardson. Boiler Maker, vol. 21, no. 10, Oct. 1921, pp. 281-283, 8 figs. Hand flanging and sectional presses used for irregular shapes in boiler and tank fabrication.

BOILERS, WATER-TUBE

Advantages. The Advantages of Walter Tube Boilers, James Kemnal. Mar. Eng. of Can. vol. 11, no. 9, Sept. 1921, pp. 22-23. Describes various cases where cylindrical boilers were replaced by water tube boilers.

BRAKES

Air-Westinghouse. New Tests of the Westinghouse Continuous Air Brake (Nouveaux essais du frein continu système "Westinghouse"), M. Tête. Revue Générale des Chemins de Fer et des Tramways, vol. 40, no. 7, July 1921, pp. 22-50, 8 figs. Results of tests in France by commission appointed by Minister of Public Works are entirely satisfactory.

BRASS FOUNDRIES

Cast Ingots. The Casting of Brass Ingots, R. Genders. Metal Industry (Lond.), vol. 19, no. 14, Sept. 30, 1921, pp. 261-262, 2 figs. Describes experiments carried out to minimize occurrence of non-metallic inclusions.

BRICKMAKING

Brick-Handling System. A New System of Handling for Brick, Tile and Pottery Works. Eng. & Indus. Management, vol. 6, no. 16, Oct. 20, 1921, pp. 451-455, 12 figs. Describes new system patented by Hirt & Cie., Paris, for conveying products from presses or other brickmaking machines to drying chamber, depositing them therein, and transporting them to kilns when sufficiently dry.

BRIDGE DESIGN

European and American Standards. American and European Bridge Standards, P.H. Chen. Eng. & Contracting, vol. 56, no, 17, Oct. 26, 1921, pp. 400-401. (Abstract.) Paper read before Assn. Chinese & Am. Engrs. with comments by J. A. L. Waddell.

BRIDGES, LIFT

Bascule. Putting Large Bascule in Service. Eng. News-Rec., vol. 87, no. 15, Oct. 13. 1921, pp. 606-607, 1 fig. Program for change to new structure across Chicago River involves minimum stoppage of street and elevated-railway traffic.

BRIDGES, RAILWAY

Impact Tests. Results of Impact Tests on Bridges in England. Eng. News-Rec., vol. 87, no. 16, Oct. 20, 1921, pp. 642-644, 2 figs. Photo-recording strain gage applied to 20 bridges yields 362 records. High-frequency vibration found expecially in floor systems. New formula proposed. Results of experiments to measure impact effects in railway bridges carried out during past year in England.

BUSSES

Interior Lighting. Interior Lighting of Busses, L. C. Porter and R. W. Jordan. Trans. Illuminating Eng. Soc., vol. 16, no. 5, July 20, 1921, pp. 77-94, and discussion, 111-116, 13 figs. Describes tests made with domes and tungsten filament lamps, also lighting units equipped with reflectors.

C

[illegible] dixes.

CASTING

[illegible]

CHAIN DRIVE

[illegible] Automotive Industries, vol. 45, no. 16, Oct. 20, 1921, pp. 773-778, 18 figs. [illegible]

[illegible]

BIBLIOGRAPHY. A Bibliography and Abstract of Chromium Steels. F. P. Zimmerli. Chem. & Met. Eng., vol. 25, no. 18, Nov. 2, 1921, pp. 837-843. Chronological [illegible]

COAL MINING

HYDRAULIC STOWING. Hydraulic Stowing, George Know and J. Drummond Paton. Iron & Coal Trades Rev., vol. 103, no. 2796, Sept. 30, 1921, pp. 463-466, 14 [illegible]

COFFERDAMS

[illegible] Eng. News-Rec., vol. 87, no. 20, Nov. 17, 1921, pp. 806-808, 7 figs. Trestle [illegible] N.B.

COKE

[illegible] Production, Distribution, and Uses of Coke. [illegible] 156, no. 3047, Oct. 5, 1921, pp. 37-38. Discusses use of coke as fuel and [illegible] 103, no. 2796, Sept. 30, 1921, p. 471.

COMBUSTION

[illegible] Arthur Haward. Proc. Roy Soc., vol. 100, no. A 702, Oct. 4, [illegible] actual rate at which potential energy is transferred on explosion [illegible]

COMPASSES

GYROSCOPIC. The Gyro Compass for Surveyors. Min. Mag., vol. 25, no. 4, Oct. 1921, pp. 220-222, 2 figs. Description of Anschütz gyro compass (made [illegible]

CONCRETE

[illegible] Weather. Tokujiro Yoshida. University of Ill., vol. 18, no. 35, May 2, 1921, 55 pp., 19 figs. Account of experiments furnishing test data on length of time required for concrete of given temperature to lose its heat and become cold [illegible]

ROAD. Laboratory Control of Concrete. H. S. Mattimore. Can. Engr., vol. 41, no. 17, Oct. 27, 1921, p.l. Enumerates factors regulating proportion of mix; [illegible]

SAND [illegible] Concrete. Cem. & Eng. News, vol. 33, no. 11, Nov. 1921, pp 21-24. Review [illegible] for Ind. Sand & Gravel Producers' Assn.

STRENGTH, EFFECT OF AGE ON. Effect of Age on Strength of Concrete for High- [illegible] figs. Criticism of report of tests made on concrete used in California highways. Tests show that age increases strength of concrete when in contact with moisture.

CONDENSERS, STEAM

NEW TYPE HIGH EFFICIENCY. Steam-Consending Plants, Paul A. Bancel. Mech. Eng., vol. 43, no. 11, Nov. 1921, pp. 711-716 and 758, 14 figs. Detailed consi- [illegible] and description of new type of high efficiency condenser.

CONDUITS

[illegible] Sewer Tunnels, Julian Hinds. Eng. News-Rec., vol. 87, no. 17, Oct. 27, 1921, pp. 693-694. Presents tables giving head and discharge at critical depths and static pressures in circular and horseshoe conduits partly full.

CONVEYORS

PULVERIZED MATERIALS. Pulverized-Material Conveyor System. Power, vol. 54, no. 17, Oct. 25, 1921, pp. 628-629, 4 figs. Describes the Fuller-Kinyou conveying system for pulverized material, comprising a power-driven pump function of which is to start the mass in motion; source of compressed-air supply and a pipe through which material flows.

TYPES. [illegible] Terry. [illegible] and 301-302. Oct. 7: Dicsusses bucket elevators and worm or Archimedean screw conveyors. Oct. 14: Discusses band Zimmer, gravity and peunmatic conveyors. Paper read before Belfast Assn. of Engrs.

[illegible]

COPPER ALLOYS

CUPRO-NICKEL. Manufacture of Cupro-Nickle, Herbert D. Swift. Metal Industry (N. Y.), vol. 19, no. 10, Oct. 1921, pp. 394-395. Description of process going in regular order from casting to packing.

CORROSION

ELECTROLYTIC. Electrolytic Corrosion of Lead Thallium Alloys, Colin G. Fink and Charles H. Eldrige. Am. Electrochem Soc., advance paper, no. 26, for meeting Sept. 29-Oct. 1, 1921, pp. 335-344, 4 figs. Shows that addition of thallium to lead alloys has been very effective in reducing anadic corrosion in acid copper sulphate electrolytic containing nitric and hydrochloric acids.

HEATING SYSTEM. Preventing Corrosion in Heating System, Perry West. Domestic Eng. (Chicago), vol. 97, no. 2, Oct. 8, 1921, pp. 50-53 and 82-84, 4 figs. Describes deoxidizing and de-aerating methods.

COST ACCOUNTING

CLASSIFICATION OF SURPLUS. Classification of Surplus. C. B. Couchman. Jl. of Accountancy, vol. 32, no. 4, Oct. 1921, pp. 265-278. Discusses various kinds [illegible] Paper read before Am. Inst. of Accounts.

UNIFORM MILL SYSTEMS. Uniform Mill Cost Systems, C. Oliver Wellington. Paper, vol. 29, no. 6, Oct. 12, 1921, pp. 13-15. Discusses advantages of uniformity in cost accounting.

COSTS

MATERIAL RECORDING. The Recording of Material Costs, E W Workman. Eng. & Indus. Management, vol. 6, no. 16, Oct, 20. 1921, pp. 426-427. Describes method of dealing with material charges which has been found to work exceptionnally well in large engineering firm using Hollerith system for dealing with its labor and overhead expenses.

CRANES

BRIDGE. New Type of Bridge Crane for Handling Sand and Gravel, W. A. Scott. Cem., Mill & Quarry, vol. 19, no. 8, Oct. 20, 1921, pp. 27-28, 2 figs. Has max. length of 184 ft.; clamshell busket has capacity of 3 yd.; carriage speed, 800 ft.; per min.; bucket speed 200 ft.

CRANKCASES

MALLEABLE-IRON. Crank Cases Made of Malleable Iron. Foundry, vol, 49, no. 19, Oct. 1. 1921, pp. 762-766, 10 figs. An extensive series of experiments in molding and in subsequent heat treatment was required before castings were produced on a commercial basis

CUTTING METALS

UNIVERSAL OXYGEN-JET. A universal Oxygen-Jet Cutting Machine. Eng. Production, vol. 3, no. 56, Oct. 27, 1921, pp. 395-397, 3 figs. Details and uses of machine by Godfrey Eng. Works, London.

D

DIES

AUTOMOBILE PARTS. Making Dies for Forming Automobile Parts, Richard Dale. Iron Age, vol 108, no 18, Nov 3, 1921, pp 1127-1129, 10 figs Explains design and construction for manufacture of such articles zs brake drums and step brackets.

SHAVING TOOLS. Notes on the Design of Shaving Tools, Hugo F. Pusep. Am. Mach., vol. 55. nos. 16 and 17, Oct. 20 and 27, 1921, pp. 624-626 and 686-689, 18 figs. Second operation necessary to obtain accuracy of size and contour. Discusses three general classes of shaving tools.

WIRE-DRAWING DIAMOND. Diamond Dies for Wire Drawing, C. W. Busick. Am. Mach., vol. 55, no. 18, Nov. 3, 1921, pp. 703-705, 7 figs. How dies are lapped and tested for size. Automatic lapping machines for this work.

DIESEL ENGINES

COMBUSTION IN. Explosion and Internal-Combustion Engines (Moteurs à Explosion et à Combustion Interne), F. Huard. Arts et Métiers, vol. 74, no. 11, August 1921, pp. 242-246, 2 figs. Discusses combustion in Diesel and semi-Diesel engines. (Concluded.)

MARINE. Building Marine Diesel Engines. Eng. Production, vol. 3, nos. 53 and 54, Oct. 6 and 13, 1921, pp. 321-325 and 349-352, 21 figs. Methods and equipment of the North British Diesel Engine Works, Ltd., at Glasgow, founded in 1913 for purpose of developing marine Diesel engine up to 12,000 hp.

The Marine Diesel Engine: Its Reliabily in Service, Andrew J. Brown. Trans. Inst. Mar. Engrs., vol. 33, Sept. 1921, pp. 297-307 and (discussion) 307-325, 7 figs. Discusses the various parts of engine from the standpoint of showing how reliability is ensured.

WORTHINGTON SOLID-INJECTION. The Worthing Solid-Injection Diesel. Power, vol. 54, no. 18, Nov. 1, 1921, pp. 675-677, 3 figs. Engine operating on Diesel cycle without air injection. Novel means employed to secure combustion at constant pressure with pump feed.

DROP FORGING

MODERN PRACTICE. Modern Drop-forging Practice, Fred R. Daniels. Machy. (N. Y.), vol. 28, no. 3, Nov. 1921, pp. 213-217, 8 figs. Comparison of drop forgings and castings, and general methods of making them.

DRYING

CHRONOLOGICAL SURVEY. A Chronological Survey of Drying and Dryers, J. E. Bolling. Jl. Am. Soc. Heating & Ventilating Engrs., vol. 27, no. 7, Oct. 1921, pp. 715-738, 19 figs. Notes on heating and moisture-removal methods; evolution of the compartment dryer; efficiency of dryers.

E

ELECTRIC CURRENT

GROUND DETECTORS. Ground Detecting Devices, Victor H. Todd. Power Plant Eng., vol. 25, no. 20, Oct. 15, 1921, pp. 994-997, 12 figs. Dicsusses single-phase and three-phase ground detectors, electrostatic voltmeters and glow-meters, etc.

ELECTRIC DRIVE

LUMBER MILLS. Application of Electrical Energy in Lumber Mills, W. A. Scott. [illegible] Nov. 5, 1921, pp. 685-688, 6 figs. Saws, conveyors and other units driven by belted and direct-connected motors; [illegible] lumber industry, mill refuse as fuel to generate [illegible] power

ELECTRIC FURNACES

GRAY-IRON CASTINGS. Gray Iron Castings from Electric Furnaces. Thomas Robson Hay. Iron Age, vol. 108, no. 19, Nov. 10, 1921, pp. 1214-1215. Present electric practice and advantages over older method. Comparative cost.

INDUCTION. A New Electric Induction Furnace (Nouveau four électrique à induction), H. Vigneron. La Nature, no. 2475, Sept. 10, 1921, pp. 163-165, 5 figs. Describes Northrup system and its applications.

IRON INDUSTRY. Electric Furnace Possibilities in the Western Iron Industry, R. C. Gosrow. Jl. Electricity & Western Industry, vol. 47, no. 7, Oct. 1, 1921, pp. 265-266. Analysis of opportunities open to the electric furnace in the Western iron industry, with data on costs.

REPELLING-ARC TYPE. Something New in Electric Furnaces, E. F. Cone. Sci. Am. vol. 125, no. 14, Oct. 1, 1921, p. 229, 1 fig. Describes repelling-arc type of furnace having a self-regulating, flaming arc torch.

SUPERHEATING IRON. Superheating Iron Electrically, George K. Elliott. Iron Trade Rev., vol. 69, no. 16, Oct. 20, 1921, pp. 1007-1011. States that by using basic-lined electric furnace in conjunction with cupola, high-temperature iron can be produced, desulphurization can be accomplished easily and impurities closely controlled. Compares composition and strength. Paper presented under auspices of Am. Foundrymen's Assn. before Inst. British Foundrymen.

ELECTRIC LOCOMOTIVES

CHARACTERISTICS. Characteristics of the Electric Locomotive, N. W. Storer. Jl. Franklin Inst., vol. 192, no. 4, Oct. 1921, pp. 453-467, 8 figs. Deals with d.c. and a.c. locomotives, and regenerative braking.

COMPARISON WITH STEAM. Some Mechanical Characteristics of High-Speed, High-Power Locomotives, A. W. Gibbs. Jl. Franklin Inst., vol. 192, no. 4, Oct. 1921, pp. 469-495, 26 figs. Deals principally with results of comparative trial of steam and electric locomotives amde in 1907 to secure information in connection with design of electric locomotives for Pennsylvania terminal in New York.

CONTROL EQUIPMENT. Electrical Considerations Which Govern in a Choice of Locomotives for Any Given Class of Service, H. H. Johnston. Coal Age, vol. 20, no. 18, Nov. 3, 1921, pp. 717-719, 4 figs. Locomotives with dynamic braking controllers deliver current on descending grades and must have additional motor capacity. Series-and-parallel control vs. series-parallel control.

MIDI RAILWAY FRANCE. Mechanical Aspects of the New Electric Double-Bogie Locomotives of the Midi Railroad in France [Sur les dispositions mécaniques d'ensemble des nouvelles locomotives électriques à deux bogies moteurs (type de la compagnie des chemins de fer du Midi,] Fernand Broussouse. Le Technique Moderne, vol. 13, no. 3, March 1921, pp. 97-101, 12 figs. Discusses French and Amrrican suspensions, interchangeability and balancing of Midi bogies, etc.

SELECTION. Mechanical and Engineering Considerations Determining the Selection of an Electric Locomotive, H. H. Johnston. Coal. Age, vol. 20, no. 17, Oct. 27, 1921, pp. 679-681, 5 figs. Discusses mine-haulage equipment and their specifications, locomotives, speed, and weight of rail.

ELECTRIC PLANTS

BANGOR, ME. Remodeling Plant to Increase Rating, Phifer Smith Elec World vol. 78, no. 17, Oct. 22, 1921, pp. 815-818, figs. Describes new constructions at Veazie power plant of Bangor (Me.) Ry. & Electric Co., including four new units of 1,800 kw. capacity each.

BLACKBURN, ENGLAND. Electricity Supply in Blackburn. Electrician, vol, 87, no. 2267, Oct. 28, 1921, pp. 535-539, 3 figs. Describes coal and ash handling plants, boiler house, turbo-alternators (two 10,000 kw. each driving 6,600=volt 50-period three-phase alternators), and auxiliaries of new power station.

EDINBURGH. New Electricity Station at Edinburgh, S. B. Donkin. Electrician, vol. 87, no. 2263, Sept. 30, 1921, p. 407. Describes equipment, including generating plant, sea work pumps, shafts and tunnels. H. T. three-phase current; ultimate capacity 100,000 kn. (Abstract.) Paper read before British Assn.

LARGE UNITS. Some Notes on Large Electric Units, Stanley Parker Smith. Electrician, vol. 87, no. 2262, Sept. 23, 1921, pp. 378-380, 5 figs. Discusses prime movers, a.c. and d.c. production, converters, mercury rectifiers etc. (Abstract.) Paper read before British Assn.

LONDON UNDERGROUND RAILWAY. Chelsea Power Station—London Underground Railway. Tramway & Ry. World, vol. 50, no. 20, Oct. 20, 1921, pp. 185-189, 5 figs. Describes new equipment installed, including 15,000-kw. turbo-alternators, condensing water plant, etc.

REACTANCES, APPLICATION OF. The Application of Reactances to Large System, W. A. Coates. Beama, vol. 9, no. 4, Oct. 1921, pp. 330-334, figs. Describes the case where two existing stations are to be linked with a third new plant, by means of a high-voltage cable system.

SMALL. Economies in Operation of Small Power Plants, E. S. Hight, Elec. Rev., Chicago), vol. 79, no. 16, Oct. 15, 1921, pp. 573-576, 3 figs. Discusses selection of coal, reduction of air leakage and radiation losses, engine room economies, etc. Extracts from paper before Iowa section of N. E. L. A.

ELECTRIC RAILWAYS

THIRD-RAIL SYSTEM. Experiences of Northwestern Pacific Ry. with Third Rail System, C. E. Hatch. Eng. & Contracting, vol. 56, no. 16, Oct. 19, 1921, p. 380. Experiences in operation of 37 mi. of electrified track on which third-rail system is employed. Notes on how contact rail is supported; protections at crossings and stations; method of carrying feeders; and maintenance cost. (Abstract.) Paper read before Pac. Ry. Club.

ELECTRIC SWITCHES

Safety. Types, Construction and Application of Safety Switches. Elec. Rec., vol. 30 no. 5 Nov. 1921, pp. 341-349, 58 figs. Defines and classifies existing types of safety switches and gives details of their design and construction.

ELECTRIC TRANSMISSION LINES

California. Building a World's Record Transmission Line in the West, Robert Sibley. Jl. Electricity & Western Industry, vol. 47, no. 8, Oct. 15, 1921, pp. 301-303, 14 figs. Some of the problems of construction which have been overcome by western engineers in building the record 165,000-volt, 240-mile transmission line from Caribou plant to San Francisco.

Inductive Interference. Inductive as Seen by the A.R.A. Elec. World, vol. 78, no. 16, Oct. 15, 1921, pp. 767-769. Gives second section of report of Inductive-Interference Committee of Am. Ry. Assn., dealing with causes and effects.

Line-Loss Expense. Determination of Line-Loss Expense, P. O. Reyneau and H. P. Seelye. Elec. World, vol. 78, no. 16, Oct. 15, 1921, pp. 771-773, 1 fig. Can be based on equivalent hours of peak-load usage. Method of applying to a specific case. Corrections for special conditions. Range of value for equivalent hours.

ELECTRIC WELDING, ARC

Rail Joints. Arc Welded Rail Joints. Welding Engr., vol. 6. no. 10, Oct. 1921, pp. 27-32, 13 figs. Discusses welding rail joints by the Detroit street-car system and test made.

ELEVATORS

Electrical Troubles. Locating Electrical Trouble on Elevators, William Zepernick, Power, vol. 54, no. 20, Nov. 15, 1921, pp. 755-757, 14 figs. Grounds, short circuits and open circuits defined. Methods of grounding power systems. Examples given on how to locate electrical faults on controller equipment.

EMPLOYEES

Thrift Encouragement by Employers. Thrift Encouragement by Employers—V, Leonhard Felix Fuld. Indes. Management vol. 62, no. 5, Nov. 1921, pp. 287-289. Points out that investment companies appear to be ideal thrift encouragement plan for workers as they furnish a thrift encouragement vehicle for each class of worker.

EMPLOYEES, TRAINING OF

Selection and. Industrial Training and Selection of Personal, C. R. Dooley. Chem. & Met. Eng., vol. 25, no. 15, Oct. 12, 1921, pp. 692-695. Outline of basic principles underlying modern methods of selecting and training employees, and some helpful suggestions for solving personnel problems.

ENAMELING

Steel Containers. Enamel-Lined Apparatus, Chester H. Jones. Chem. & Met. Eng., vol. 25, no. 20 Nov. 16, 1921, pp. 927-932, 17 figs. Plant of Elyria Enameled Products Co. at Elyria, Ohio, engages in manufacture of enameled equipment for service in many varieties of plant processing; steel and cast-iron containers; burning equipment; composition and properties of enamels; control and management of operations.

EVAPORATORS

Design. An Improvement in Evaporator Design, Robert V. Cook. Chem. Age (N.Y.), vol. 29, no. 10, Oct. 1921, pp. 409-410, 1 fig. Describes the criss-cross evaporator.

Tests. Result of Operation With Some Evaporators (Résultats de marche de quelques appareils d'évaporation), M. Depasse. Bul. de l'Association des Chimistes de Sucrerie et de Distillerie vol. 38 no. 10. April 1921, pp.383-404 and (discussion) 407-409, 2 figs. Gives test data with two-stage, three-stage, and four-stage evaporators.

EXCAVATION, EARTH

Principles of. Fundamental Principles in Handling Earthwork, D. H. Sauerbraun. Can. Engr., vol. 41, no 16, Oct. 20, 1921, pp. 5 and 12. Notes on scraper system and rock-drilling equipment. Paper read at Highway Conference at University of Pa.

FACTORIES

Planning Operation. Notes on the Preparation of Work Lay Outs, H. Varley, Eng. & Indus. Management vol. 3, no. 57, Nov. 3, 1921, pp. 491-494, 9 figs. Writer enumerates points which should be carefully considered when a part is to be laid out in operations.

Rubber Tires. Mechanical Features of Tire Factory. Iron Age, vol. 108, no. 20, Nov. 17, 1921, pp. 1259-1265, 8 figs. New Kelly-Springfield plant is said to have unusually complete interconnection of mechanical services. Notes on tunnels, piping, wiring and communication.

FACTORY MANAGEMENT

See Industrial Management.

FANS, CENTRIFUGAL

Design. Controlling Factors in Fan Design, David Darrin. Heat & Vent. Mag., vol. 18, no. 10, Oct. 1921, pp. 49-52. Discusses required capacities available space and attendance, allowable first cost and operating cost, etc., and gives table of present standards of fan design.

Electrically Driven. Electrically Driven Centrifugal Fans for Mine Ventilation. Mech. World, vol. 70, no. 1815, Oct. 14, 1921, pp. 303-304. Discusses characteristics of fans and motors, power requirements, etc.

Heaters and. Fans and Heaters, Charles L. Hubbard. Southern Engr., vol. 36, no. 2, Oct. 1921, pp. 44-49, 12 figs. Working data for fans; fan drives; heaters; determining size of heater; heater arrangements; heater connections, ducts and flues.

FATIGUE

Industrial. Physiological Methods for Measuring Industrial Fatigue (Les Méthodes Physiologiques actuelles d'évaluation de la Fatigue dite "Industrielle") D. Gilbert. Annales des Mines de Belgique, vol. 22, no. 3, 1921, pp. 837-847, 1 fig. Concludes that present methods are not strictly applicable.

Reduction. Reducing Fatigue in Tool Rooms, F. B. and L. M. Gilbert. Iron Trade Rev., vol. 69, no. no. 16. Oct. 20, 1921, pp. 1004-1006. 7 figs. Orderly arrangement of tools, conveniently placed shelves and drawers, and white surfaces tend to improve conditions in tool crib. Ample sunlight inportant. (Abstract.) Paper before Soc. Indus. Engrs.

Tests. Fatigue Tests at Purdue University, George H. Shepard. Indus. Management, vol. 62, no. 5, Nov. 1921, pp. 281-286, 4 figs. How exertion and rest periods affect efficiency. Includes chart showing output in foot-pounds under certain conditions of work and rest periods.

FILING SYSTEM

Classification, Indexing and. Classification, Filing and Indexing System for Pulp and Paper Library, Carleton E. Curran. Paper, vol. 28, nos. 19, 20 and 21, July 13, 20 and 27, 1921, pp. 9-11, 23 and 30, —. 17-19 and pp. 17-18. Gives an adaptation of the Dewey classification..

FILTERS

Centrifugal. Centrifugal Filters, H. C. Beckman. Jl. Indus. & Eng. Chem., vol. 13, no. 11, Nov. 1921, pp. 992-993. Discusses those with perforated drum and those having an imperforate drum, and advantages of the latter. Paper read before Am. Chem. Soc.

Centrifugal. Discusion of Centrifugal Draining, T. A. Bryson. Jl. Indus. & Eng. Chem., vol. 13, no. 11, Nov. 1921, pp. 993-996, 3 figs. Discusses removing force, restraining force and resistance to motion, which are factors affecting drainage. Gives chart of centrifugal force per lb. of load. Paper read before Am. Chem. Soc.

FILTRATION

Filter Media. Industrial Filter Media, Arthur Wright. Jl. Indus. & Chem., vol. 13, no. 11, Nov. 1921, pp. 984-986. Discusses cotton cloths, properties affecting discharge of cake, media for corrosive materials, etc. Paper read before Am. Chem. Soc.

FILTRATION PLANT

Peterborough, Ont. New Filtration Plant at Peterborough, R. L. Dobbin. Can. Engr., vol. 41, no. 18, Nov. 3, 1921, pp. 1 and 4, 12 figs. Concrete dam across Otonabee River provides power for turbine-driven pumps. New filtration plant and 2,000,000-gal. concrete reservoir recently constructed. Five filter units built, six provided for.

FLOOD CONTROL

Pratt Porous Dam. Making the Flood Dam Itself, J. F. Springer. Sci. Am., vol. 125-A, no. 17, Nov. 1921, pp. 38-39, 3 figs. Describes simple wire netting structure that gathers mud, boulders and miscellaneous debris to form a barrier.

FLUE-GAS ANALYSIS

Testing Apparatus. Apparatus for Testing Flue-Gas, John B. C. Kershaw.. Combustion vol. 5, no. 5, Nov. 1921, pp. 204-207 and 218, 9 figs. Describes seven gas-testing instruments which depend upon the measurement of some physical property of waste-gases which also serves as an index of the amount of CO_2 contained in them.

FORGE PLANTS

Safety Guards in Shops. Using Safety Devices in Forge Shops. Iron Trade Rev., vol. 69. no. 19. Nov. 10, 1921, pp. 1216-1217, 6 figs. Decribes simple and inexpensive guards which are being used in one shop.

FOUNDATIONS

Steam Power Plants, etc. Some Notes on Foundation Plans, Douglas Wilson. Mech. World, vol. 70, no. 1816, Oct. 21 1921, pp. 327-328, 6 figs. Discusses foundations for prime movers, steam power installations, steam turbines, concrete and reinforcement.

FOUNDRIES

Steel. Famous British Works. Eng. Production, vol. 3. no. 54, Oct. 13, 1921, pp. 338-339, 2 figs. Details of plant and equipment of steel foundry of Edgar Allen & Co., Ltd., Tinsley for production of high-speed, carbon and alloy tool steels, special alloy steels for automobiles and aircraft, toughened steel castings for engineering and other purposes, dynamo magnet-steel castings, Imperial manganese steel etc.

TEMPERATURE PROBLEMS. Temperature Problems in Foundry and Melting Room, John P. Goheen. Trans. Am. Inst. Min. & Metallurgical Engrs., no. 1105-N 1921, 5 pp. Notes on pyrometer equipment for electric brass-melting furnace; special equipment for brazing brass; core-oven temperature control; and value of annealing. Abstract in Min. & Metallurgy, no. 179, Nov. 1921, p. 36.

FREQUENCY

ZERO MEASURING METHOD. A Frequency-Bridge, Edy Velander. Jl. Am. Inst. Elec. Engrs., vol. 40, no. 11, Nov. 1921, pp. 835-839, 3 figs. Apparatus for accurate determination of frequency, by means of a null method.

FUELS

GASEOUS. Gaseous Fuel in the Shipbuilding World, George Keillor. Gas Jl., vol. 156, no. 3047, Oct. 5, 1921, pp. 34-37. Discusses application in annealing, hardening and normalizing. Billet, plate and rivet heating; core and mold drying; fuel consumption. See also Iron & Coal Trades Rev., vol. 103, no. 2796, Sept. 30, 1921, pp. 476-478.

SMOKELESS, MANUFACTURE OF. The Manufacture of Smokeless Fuel. Engineering, vol. 112, no. 2913, Oct. 28, 1921, pp. 596-601, 41 figs., partly on supp. plate; also Engineer, vol 132, no. 3435, Oct. 28, 1921, p. 464, 3 figs. Describes works of low Temperature Carbonisation, Ltd., Barugh, England which has 20 retorts in continuous service and are carbonizing 36 tons of coal daily. Fuel produced is sort of semi-coke carrying only very small proportion of breeze and is called coalite.

[*See also Oil Fuel, Pulverized Coal.*]

G

GAGES

PRECISION. Precision Gauges, M. E. Kanek. Mech. World, vol. 69, no 1782, Feb. 25, 1921, pp. 139-141. Discusses 81-block sets, types on the market, effect of size on a accuracy, material for gages, direct and comparative methods of measuring, etc.

SNAP. Systems of Gauging. Eng. Production, vol. 3, no. 54, Oct. 13, 1921, pp. 345-346 2 figs. Describes an adjustable snap gage and setting micrometer, which is said to be adaptable and inexpensive.

GAS PRODUCERS

FUEL ECONOMY. Fuel Saving in Modern Gas Producers and Industrial Furnaces, W. B. Chapman. Mech, Eng., vol. 43, no. 11, Nov. 1921, pp. 717-721, 7 figs. Calls attention to fuel wastes in industries using gas producers and producer-gas furnaces, reviews progress in last 25 years in gas-producer construction, and describes distinctive type of recuperative furnace and extension of its use to pulverized coal and oil. (Abstract.)

GAS WORKS

LOW GRADE FUELS, USE OF. Gas-Works Steam-Raising and the Use of Low-Grade Fuels, H. L. Bateman. Gas Jl., vol. 153, no. 3010, Jan. 19, 1921, pp. 162-163 and (discussion) 163-164, 1 fig. Discusses Lancashire versus water-tube boilers, forced draught, pulverized fuel, mechanical fuel and ash handling.

GEAR CUTTING

GEAR SHAPERS. Production Shaping. Machy. (N. Y.), vol. 28, no. 3, Nov. 1921, pp. 186-190. 10 figs. Use of shapers in production work in machine-tool building plants.

MACHINE. An Improved Gear Generating Machine. Eng. Production, vol. 3, no. 57, Nov. 3, 1921, pp. 412-415, 7 figs. Details of novel design for helical, straight [illegible] internal gears.

GEARS

EROSION IN HIGH-SPEED. Pitting in High-speed Gearing Machinery (Lond.), vol. 19, no. 472, Oct. 13, 1921, pp. 50-51, 2 figs. Discusses new method developed to eliminate pitting or erosion in teeth of wheels.

HARDENING UNDER PRESSURE. Hardening Gear Under Pressure. Eng. Production, vol. 3, no. 57, Nov. 3, 1921, pp. 426-427, 3 figs. Describes new method.

INVOLUTE. The Evolution of the Involute Gear Tooth—VIII and IX, A.Fisher. Machinery (Lond.), vol, 19, nos 474 and 475, Oct. 27 and Nov. 3, 1921, pp. 101-103, 6 figs and pp. 132-136, 7 figs Involute pitch and pressure angle [illegible]

NON-METALLIC. Design and Manufacture of Non-metallic Gears. Machinery (Lond.) vol. 19, no. 471, Oct. 6, 1921, pp. 6-11, 12 figs. Discusses preparation of rawhide and fabric-base gear materials physical characteristics, design and [illegible]

SPUR. The Production of Spur Gears, R. Waring-Brown. Eng. Production vol. [illegible] and discussion), no 56, Oct 27, [illegible] modern methods Paper presented [illegible]

[illegible] Hobbed Spur Gears, Carl G Olson [illegible] pp 222-224, 5 figs Amount of backlash recommended to provide for unavoidable inaccuracies in machining [illegible]

SYKES GEAR-TOOTH COMPARATOR. The Sykes Gear-Tooth Comparator. Mech. World, vol. 70, no. 1814, Oct. 7, 1921, pp. 280-282, 4 figs. May be used for comparing and definitely measuring thickness of teeth, for comparing uniformity of pitch and for ascertaining amount of inaccuracy of tooth shape.

GOVERNORS

SHAFT, ADJUSTING. Adjusting Shaft Governors. Power, vol. 54, no. 17, Oct. 25, 1921, pp. 641-647. Shows how to adjust different types of governors.

H

HANDLING MATERIALS

EQUIPMENT. A Survey of Materials Handling Equipment, R. H. McLain. Chem. Age, (N.Y.), vol. 29, no. 10, Oct. 1921, pp. 427-431, 25 figs. Suggestions for the use of labor-saving devices in chemical manufacture.

HEAT TRANSMISSION

BIBLIOGRAPHY. Bibliography on Heat Transmission. Am. Soc Refrig. Engrs. Jr., vol. 8, no. 2, Sept. 1921, pp. 150-162.

GAS HEATING VS. Comparison of gas and Electric Heating (Comparaison du chauffage au gas et à l'électricité, A. Grebel. Le Génie Civil, vol. 79, no. 12, Sept. 17, 1921, pp. 249-252. Compares 1 kg. of coal transformed with low tension electricity and into gas and by-products. Shows that cost of production is in favor of gas.

HEATING STEAM

ISOLATED POWER PLANT. Heating and its relation to Isolated-Plant Operation. E. L. Wider, Power vol. 54, no. 20, Nov. 15, 1921, pp. 758-761, 8 figs. Discusses factors that make for efficiency and inefficiencies in a combined power and heating plant.

RADIATION, CALCULATION OF. Radiation Calculation Charts. D. N. Crosthwait, Jr., Heat & Vent. Mag. vol. 18, no. 10, Oct. 1921, pp. 27-29, 2 figs. Gives tables of square feet of direct cast iron steam radiation for heat loss through two-pane windows, and through wall area, room temperature 70 degs. Fahr. and outside temperature 0 degs. Fahr. and explains application.

HOBS

GEAR. Inspection of Involute Spur and Helical Gear Hobs. Machinery (Lond.). vol. 19, no. 474, Oct. 27, 1921, pp. 90-95, 19 figs. Testing accuracy of hob and tooth parts; hobbing test.

HOISTING MACHINES

SAFEGUARDS. Hoisting and Conveying. Power Plant Eng., vol. 25, no. 20, Oct. 15, 1921, pp. 1000-1003. Machinery safeguards and safe operation.

HOTWATER SUPPLY

WATER-TEMPERATURE CONTROL. Determination of Hot Water Requirements. William Wilcox. Heat & Vent. Mag., vol. 18, no. 10, Oct. 1921, pp. 31-35, 7 figs. Essential points to be considered, with data on apartment houses and various methods of water-temperature control.

HOUSE

WALL CONSTRUCTION. Design and Construction of Dwelling House Walls, Carroll Beale. Concrete Products, vol. 21, no. 4, Oct. 1921, pp. 51-52. Discusses types of construction including concrete. Reprinted from Contractors Atlas.

HOUSING

GARDEN CITY SCHEME, LONDON. Building Garden-Cities at the London Conference (La Construction des Villes et Cités-Jardins à la conférence de Londres), M. De Heem. Annales des Travaux Publics de Belgique, col. 22, no. 4, August 1921, pp. 595-626, 11 figs. Partly on supp. plates. Discusses the housing question and recent competition in designs in London. Gives illustrations.

SHERBROOKE, CAN. Housing Developments in Sherbrooke. Contract Rec., vol. 35, no. 45, Nov. 9, 1921, pp. 968-969, 8 figs. Model city built to house workers of Cana dian Connecticut Cotton Mills.

HYDRAULIC TURBINES

DRAFT TUBES. Draft Tubes—How They Operate and Why. Power, vol. 54, no 16, Oct 18, 1921, pp 600-604, 17 figs Elementary, non-mathematical explanation of hydraulic draft tubes. Use of barometers and scenic railway to illustrate fundamental principles involved.

SPEED REGULATION. Speed Regulation of Hydraulic Turbines John S. Carpenter Power Plant Eng., vol. 25. nos. 19 and 20. Oct. 1 and 15, 1921, pp. 947-950 and 990-993, 5 figs. Principles and methods of calculation involved in design of hydraulic turbin governors

Speed Regulation in the Hydraulic Plant, N. L. Devendorf. Power vol, 54, no. 20, Nov. 15 1921, pp. 764-767, 6 figs. Conditions that must be met by waterwheel governor. Development from early flyball governor to present oil-pressure type. Requirements of low-head versus high-head plants. Operating in parallel.

HYDROELETRIC DEVELOPMENT

Belgium. Utilizing Hydraulic [illegible] (L'utilisation des énergies hydrauliques [illegible] Revue Universelle des Mines, vol. 11, no. 1, Oct. 1, 1921, [illegible] works, reservoirs, dams, canals, power plants [illegible] equipment, etc.

Colorado River. Electrical Construction Plan for Colorado River, Charles Heston Peirson. Elec. Rev. (Chicago), vol. 70, no. 16, Oct. 15, 1921, pp. 586-588. Comprehensive development proposed to regulate streem flow for utilization of available water power.

Switzerland. Plans for Hydroelectric Development in the Bernese Oberland (Les projets des Forces Mortices Bernoises dans l'Oberhasle), Jean Ganguillet. River and Schweiz. [illegible] vol. 12, no. 8, Aug. energy 1921, pp. 209-216, 2 figs. Presents plans for harnessing the Aar for developing in Oberhasle the future greatest source of electric energy in Switzerland.

HYDROELECTRIC PLANTS

Maximum Rates. Determination of Maximum Rates for Hydroelectric Power Centrals (La fixation des tarifs maxima dans les cahiers des charges des concessions d'énergie hydraulique), G. Tochon. Revue Générale des Electricité, vol. 10, no. 13, Oct. 1, 1921, pp. 451-455. Discussion of standard specification for maximum rates proposed by Ministry of Public Works.

I

ICE PLANTS

Brine Agitation. Modern Propeller Design for Brine Agitation and Circulation, E. A. Burrows, Am. Soc. Refrig. Engrs. Jl., vol. 8, no. 2, Sept. 1921, pp. 127-133 and (discussion) 133-134. 10 figs. Describes experiments with Halvorsen propeller, reducing power consumption from 25 to 50 per cent.

INDEXES

Construction and Comparison. Details of Index Number Construction and Comparison of Indices. E. E. George. Eng. & Contracting, vol. 56, no. 19 Nov. 9, 1921, pp. 431-434, 3 figs. Notes on volume of production index. Bradstreet's, Dun's, and Federal Reserve index, standard and tests, and cost of-living indexes.

INDUSTRIAL MANAGEMENT

Distribution of Manufacturing Expense. The Distribution of Manufacturing Expense, C. Haigh. Can. Machy., vol. 26, no. 15, Oct. 13, 1921, pp. 34-36. Discusses five methods for distributing overhead expense: man-rate; man-hour; material and labor; sold-hour; and machine-hour rate.

Factory Investigation. How Faactory Investigations Reduce Costs, Albert A. Dowd and Frank W. Curtis. Machy. (N. Y.), vol. 28, no. 3, Nov. 1921, pp. 208-212, 7 figs. Discusses effect of design upon cost of machining and gives examples of savings realized by change of design; savings effected in drilling and by use of punch press.

Material Control. Material Control for the Small Industrial Plant, Henry C. Haskell. Indus. Management, vol. 62, no. 5, Nov. 1921, pp. 271-273, 1 ig. Describes simple, direct and logical method of approaching problem. Includes illustration of stock card used in system which includes material costing, ordering and planning.

Purchasing Department. Purchasing, A. B. Johnson. Paper, vol. 28, no. 19, July 13, 1921, pp. 17-19, 28 and 38. Discusses work and organization of purchasing departments. Paper read before Superintendents' Assn.

Scientific. Scientific Management—XXXII. Henry Atkinson. Eng. & Indus. Management, vol. 6, no. 15, Oct. 13, 1921, pp. 400-401 and 403. Failures of scientific management and their cause.

Stores Records. Machine-Posted Balance of Stores Records, C. Moffitt Ford. Bul. Taylor Soc., vol. 6, no. 4. August 1921, pp. 139-152, 4 figs. Discusses mechanical equipment and card design; posting of cards; method of proof; filing, posting and verifying routine: etc. Paper read before Phila. Section of Taylor Soc.

INDUSTRIAL ORGANIZATION

Reorganizing Small Works. Reorganizing the Small Works, H. [illegible] Eng. & Indus. Management, vol. 6, no. 17, Oct. 27, 1921, pp. 459-462. 9 figs Writer demonstrates importance of forming clear idea of conditions of working capabilities of staff, and proper locations and layout of plant, in describing practical system of reorganization. Notes on planning organization chart.

Stimulating Interest of Workers. Making Work Fascinating as the First Step Toward Reduction of Waste, Water N. Polakoy. Mech. Eng., vol. 43. no. 11, Nov. 1921, pp. 731-734 and 765, 7 figs. Points out that such experiments as have been already conducted in uniting brain work with manual work have proved beyond any doubt that such a course liberates dormant or suppressed creative capacities of men, improves quality and quantity of production, and, above all, substantially ameliorates industrial relations. Advantages to owner and labor groups are set forth. Abstract.

INDUSTRIAL RELATIONS

Co-opèration. Experiments in Industrial Co-operation. Iron Age, vol. 108, no. 19, Nov. 10, 1921, pp. 1207-1208. Constructive solutions of employer-employee relations presented at meeting of Acad. of Political Science.

Economic Axioms. The Economic Axioms of Industry, E. W. Petter. Eng. & Indus. Management vol. 6, no. 18, Nov. 3, 1921, pp. 50?-502. Notes on creation and unequal distribution of wealth; community's well-being; employer and worker; piece-work rates; unemployment doles and waste; how the State can assist. (Abstract.) Lecture arranged by Indus. League & Council.

Human Factor. The Human Factor in Industry— II, Clarance H. Northcott. Indus. Management, vol. 62, no. 5, 1921, pp. 292-297, 4 figs. Points out importance of weighing physical and mental differences and study of job in vocational selection. Discusses motion study, fatigue, rest periods, etc.

Industrial Court, Great Britain. The Industrial Court of Great Britain and Ireland, R. W. Patmore, Indus. Management, vol. 62, no. 5, Nov. 1921, pp. 269-271. Its history, functions and personnel.

INTERNAL COMBUSTION ENGINES

Carburation. Study of Carburation, Thermodynamics of the Explosion Engine (Introduction à l'étude de la carburation, pyrodynamique du moteur à explosion), M. Carbonaro. Memoires et Compte Rendu des Travaux de la Société des Ingénieurs Civiles de France, vol. 74, nos. 4-5-6, April-June 1921. pp. 185-249, 13 figs. Discusses deflagration at constant pressure. ignitions temperature, flame propagation and its velocity, etc.

Cooling-Water Systems. Cooling Water Systems for Internal Combustion Engines, Edgar J. Kates. Power, vol. 54, no. 20, Nov. 15, 1921, pp. 710-713, 4 figs. Notes on quality of water; use of cooling tanks; open cooling systems and their faults; inclosed cooling systems.

Increasing Power Output. Petrol Engine Performance. Times Eng. Supp., no. 564, Oct. 1921, p. 277. Notes on increasing power output.

Supercharging. Supercharging Engine, C. H. T. Alston.. Automobile Engr., vol. 11, no. 155, Oct. 1921, pp. 337–341, 2 figs. Discusses advantages and disadvantages; its application to aircraft, road motor vehicles, marine, stationary, and portable engines; etc.

See also [illegible]

IRON

Gray, Oxygen in. Discusses Problems of the Foundry, J. Shaw. Foundry, vol. 49, no. 19, Oct. 1, 1921, pp. 759-761. Discusses different view of metallurgists regarding effect of oxygen in gray iron. Methods of making physical tests and their effects on results are pointed out.

Pig and Cast Composition of. Composition of Pig Iron and of Cast Iron, Y. A. Dyer. Iron Age. vol. 108, no. 20, Nov. 17, 1921, pp. 1267-1270. Chemical and structural composition. Various elements, their characteristics and effect on metal. Oxygen in iron.

IRON, PIG

Mixer. Pig Iron Mixer. Eng. Progress, vol. 2, no. 10, Oct. 1921, pp. 227-230, 8 figs. Advantages of mixing process; rolling and tilting mixer; electrical tilting device.

Synthetic. Synhtetic Foundry Pig Irons in Germany. Iron Age, vol. 108, no. 18, Nov. 3, 1921, pp. 1137-1138. Methods of production during war to overcome scarcity of low phosphorus irons; their properties; charcoal iron. Translated from Stahl u. Eisen, June 30, 1921.

K

Carburation. Carburation of Kerosene and the Action of the Wall (La carburation par le pétrole lampant et l'action de paroi), G. Lumet. Memoires et Compte Rendu des Travaux de la Société des Ingénieurs Civils de France, vol. 74, nos. 3–5–6–, April-June, 1921, pp. 291-300. Discusses effect of cooling the walls and gives results of tests made, also tables.

L

LABOR

Hours of Work. The Eight Hour Law (La Loi de Huit Heures), Leon Repaels. Revue Universelle des Mines, vol. 10, no. 6, Sept. 15 1921, pp. 651-676. Discusses its provisions and its application and why Belgium cannot ratify the Washington eight-hour convention.

Organization. The Purpose of the Labor Articles in Automotive Industries, Harry Tipper. Automotive Industries, vol. 45, no. 15, Oct. 13, 1921, pp. 732-733. Points out necessity for studying human side of production activities with a view to preventing trouble rather than waiting for difficulties to arise and then attempting to find a remedy. Production cost depends largely upon human organization.

LABOR TURNOVER

PROBLEM. A Common Sense Attack on Turnover, James R. Adams. Indus. Management, vol. 62, no. 5, Nov. 1921, pp. 298-302, 4 figs. Writer tells what has been done under Studebaker Corp. under present conditions, to make employees appreciate management's problems and to enlist their intelligent co-operation for the common good.

LABORATORIES

APPLIED MECHANICS. A Laboratory of Applied Mechanics (Notice sur le Laboratoire de Mécanique appliquée), J. Boulvin, F. Keelhoff, G. Van Engelen, O. Steels. Annales de l'Association des Ingénieurs Sortis des Écoles Spéciales de Gand, vol. 11, 5th, Series, 1921, pp. 130-148. Discusses its functions, and equipment for teaching purposes.

GAS. The Industrial Laboratory of the Bourbonnais Co. (Le Laboratoire industriel de la Compagnie du Bourbonnais) J. H. Brodin. Chaleur et Industrie, vol. 2, no. 17, Sept. 1921, pp. 554-560, 4 figs. Discusses development and equipment dedicated to gas interests.

SCIENTIFIC INDUSTRIAL RESEARCH. A Modern Scientific Industrial Research Laboratory and Its First Results (Un exemple de laboratoire moderne pour recherches de science industrielle ses premiers résultats). Georges Baume. Revue Générale de l'Électricité, vol. 10, no. 12, Sept, 24, 1921, pp. 396-398. Discusses laboratory of Société de Recherches et Perfectionnements Industriels, founded in 1919 at Puteaux, and how it works.

LATHE TOOLS

CIRCULAR FORM TOOLS. Designing Circular Form Tools. Eng. Production, vol. 3, no. 55, Oct. 20, 1921, pp. 370 371, 2 figs. Describes use of pratical formulas.

APRON DESIGN. Lathe Aprons. A. Clegg. Eng. Production, vol. 3, no. 55, Oct. 20, 1921, pp. 373-378, 12 figs. Comparison between typical English and American designs.

FEED REVERSE MECHANISMS. The Design of Feed Reverse Mechanisms for Lathes, A. Clegg. Machinery (Lond.), vol. 19, no. 472, Oct. 13, 1921, pp. 34-39, 13 figs. Discusses the tumbler, fixed center, bevel, and planetary or epicyclic gears, and their advantages and disadvantages.

HEADSTOCK DESIGN. Improved Lathe Headstock Details and their Jigs, Hubert Hentley. Eng. & Indus. Management, vol. 6, no. 15, Oct. 13, 1921, pp. 398-399, 4 figs. Describes very simple and successful type of spring-locking bolt and jig employed to ensure accuracy in drilling of locking bolt holes in both cone and gear wheel.

"NON-STOP" METHODS. Devices for Repetition Work. Eng. Production, vol. 3, no. 56, Oct. 27, 1921, pp. 392-393, 4 figs. Describes certain non-stop methods, by means of which lathes or machines are kept running.

TURRET. Production Work in the Locomotive Shop Machy.(N. Y.), vol. 28, no 3, Nov. 1921, pp. 228-230, 2 figs. Application of the Bullard vertical turret lathe.

LIGHTING

EXTERIOR AND INTERIOR. Improved Practices in Exterior and Interior Illumination. Elec. World, vol. 78, no. 20, Nov. 12, 1921, pp. 971-974, 8 figs. Broadening applications of modern equipment yielding greater service to industry and homes.

FACTORY. Better Illumination Cuts Production Costs, Ward Harrison, Orville F. Haas and Fred W. Dopke. Elec. World, vol. 78, no. 16, Oct. 15, 1921, pp. 763-764, 2 figs. Test data show increase in production of 12.2 per cent due to installation of modern lighting system. Tests made by Dover Mfg. Co., Dover, Ohio.

STREET. Recent Developments in Street Illumination, C. W. Koiner. Eng. & Contracting, vol. 56, no. 18, Nov. 2, 1921, p. 420. Discusses gas-filled lamps; type and height of post; cost of installation and wiring of ornamental system: cost of street lighting etc. Report of committee on street lighting presented before Am. Soc. Mun. Improvements.

LIME

[illegible] The [illegible] Art of Lime Burning, George B. Wood. Chem. & Met. Eng., vol. 25, no. 15, Oct. 12, 1921, pp. 705-708, 6 figs. Complete mechanical handling [illegible] and precise technical control of all operations have been pro[illegible] plant of Rockland & Rockport Lime Corp. Crushing plant, kilns, charging equipment, storage and packing. Paper read before Nat. Lime [illegible]

LOCOMOTIVE BOILERS

[illegible] and Fixing Fire Tubes in Locomotive Boilers [illegible] tubes à fumée dans les chaudières de locomotives, [illegible] Technique, vol. 13, no. 2, Feb. 1921, pp. 59-62, 12 [illegible] apparatus for the purpose.

LOCOMOTIVES

[illegible] Operating Factors. Ry. Rev., vol. 69, [illegible] Results of test made with five new [illegible] fitted with boosters. Operating [illegible]

ECONOMIC USE OF STEAM. On the question of the Economic Production and Use of Steam on Locomotives, Maurice Lacoin. Bulletin International Ry. Assn., vol. 3, no. 9, Sept. 1921, pp. 1157-1204, 35 figs. Discusses steam superheating and compounding, packings, valves, feedwater heating water-tube boilers, scale, combustion control, etc. Appendixes.

ECONOMICAL DESIGN. Avoidable Waste in Locomotive Operation as Affected by Design James Partington, Mech. Eng., vol. 43, no. 11, Nov. 1921, pp. 729-730. Points out that best way to overcome waste is to design locomotive so that it will fulfill efficiency requirements of (1) a drawbar horsepower for minimum amount of fuel, (2) for minimum amount of weight of locomotive and tender, and (3) for minimum cost of repairs, and shows how these are secured. (Abstract)

FEEDWATER HEATING. Feed Water Heating on the London & North Western Railway. Ry. Gaz., vol. 35, no. 16, Oct. 14, 1921, pp. 572-574, 2 figs. Details of latest application of Weir feed water heating system and pump to "George the Fifth" class of express locomotive.

FLOATING BUSHINGS. The Development of Floating Bushings. Ry. Rev., vol. 69, no. 17, Oct. 22, 1921 pp. 535-538, 5 figs. Describes early development and recent application to new locomotives built by Am. Locomotive Co.

MALLET. Virginian Mallet Locomotives. Ry. Jl., vol. 27, no. 10, Oct. 1921, pp. 12-13 1 fig. Tractive power 147, 200 lb., working compound and 176,600 lb., working simple; 2-10-10-2 type. Comparison with 2-8-8-2 type.

MEXICAN RAILWAYS. New Power for Rehabilitation of Mexican Railways. Ry. Rev., vol. 69, no. 18, Oct. 29, 1921, pp. 578-580, 5 figs. Baldwin builds nearly 100 locomotives comprising five distinct type for service on heavy grades. See also Ry. Age, vol. 71, no. 26, Nov. 12, 1921, pp. 937-939.

OPERATION. Traveling Engineers Present Valuable Reports. Ry. & Locomotive Eng., vol. 34, no. 10, Oct. 1921, pp. 265-271. Discusses operation and maintenance of oil-burning locomotives, self-adjusting wedges, feedwater heaters, devices for increasing tractive power, and operating stoker-fired locomotives. Report of Executive Committee.

SULPHATE OF AMMONIA MANUFACTURE. The Manufacture of Neutral Sulphate of Ammonia at the Bedford Gas-Works, J. B. Hansford. Gas Jl., vol. 155, no. 3046, Sept. 28, 1921, pp. 721-722 and (discussion) 722-723, 1 fig. Describes plant and operations. Paper read before Eastern Counties Gas Managers' Assn.

PAULISTA RAILWAY, BRAZIL. Electric Motive Power for Paulista Railway. Ry. Age, vol. 71, no. 16, Oct. 15, 1921, pp. 721-722, 3 figs. Describes electric freight and passenger locomotives for Brazil; tractive efforts at 25 per cent adhesion 58,500 lb. and 51,000 lb. respectively.

THERMIC SIPHONS. The Installation and Operation of Thermic Syphons. Boiler Maker, vol. 21, no. 10, Oct. 1921, pp. 273-277, 12 figs. Discusses application to locomotives as an efficiency-promoting device.

LUBRICATION

TESTS on STEAM AND GASOLINE ENGINES. Comparative Lubrication Engineering. Sci. Lubrication, vol. 1, no. 9, Sept. 1921, pp. 18-21. Describes test on small-power Corliss engine, and on a Continental motor, giving some interesting dilution data.

LUBRICATING OILS

CASTOR AND MINERAL-OIL MIXTURE. Tests of Castor Oil and Mineral Oil Mixtures on Gnome Rotary Engine, O. J. May and Howard Cooper. Sci. Lubrication, vol. 1, no. 9, Sept., 1921, pp. 10-14, 6 figs. U. S. Army Service report discussing method and results of tests made.

M

MACHINE CONSTRUCTION

RECORD OF MATERIALS. Record of Materials Used in Machine Construction. Machinery (Lond.), vol. 19, no. 471, Oct. 6, 1921, pp. 1-3, 4 figs. Gives details of a "commodity book" in which are recorded all materials and standard parts used by the firm; these records are kept up-to-date. Various advantages are claimed for this book.

MACHINE SHOPS

ENGLISH. Famous British Works. Eng. Production, vol. 3, nos. 55, 56 and 57. Oct. 20, 27 and Nov. 3, 1921, pp. 362-363, 4 figs., 386-388, 4 figs., and 410-411, 2 figs. Oct. 20: Worcester works of Heenan & Froude, Ltd., for manufacture of Froude dynamometers, Heenan air filters, oil and water coolers, refuse destructors, and refrigerating machinery, Oct. 27: Works of Marshall, Sons & Co., Ltd., Gainsborough, Lincolnshire, for manufacture of engines, boilers and machines, Nov. 3: Works of John Fowler & Co., Ltd., Leeds, for manufacture of steam plows, road-transport and heavy-haulage engines, traction engines, etc.

The Wellman Smith Owen Engineering Works at Darlaston. Iron & Coal Trades Rev., vol. 103, no. 2798, Oct. 14, 1921, pp. 545-546, 18 figs. on pp. 547-550. Describes machine, fitting and erecting, and pattern shops, laboratory, welfare section, etc.

LAYOUT. Building Machine Tools in a New Plant, F. L. Prentiss. Iron Age, vol 108, no. 17, Oct. 27, 1921, pp. 1070-1075, 16 figs. Arrangement, transportation system, routing of material and lighting are features of Colburn Machine Tool Co., Cleveland, Ohio.

Factory Lay-out as an Aid in Reducing Costs. Machy. (N.Y.), vol 28, no 3, Nov. 1921, pp. 182-185, 8 figs. Describes new plant of Colburn Machine Tool Co., Cleveland, Ohio, laid out with view to economy in Manufacturing.

MACHINE-TOOL INDUSTRY

Orient as Market. The Orient as a Machine-Tool Market, W. E. Rastall. Am. Mach., vol. 55, no. 18, Nov. 3, 1921, pp. 730-735. Data on pre-war growth of foreign business and growth since 1915; foreign markets other than European. How to sell machinery in Asia. Address before Machine Tool Builders.

MACHINERY

Dismantling. Valuable Hints on the Dismantling of Machinery. Can. Machy., vol. 26, no. 15, Oct. 13, 1921, pp. 29-32, 8 figs. Discusses separation of rusted parts, seized parts, forcing methods, and bolt action.

Perforated-Record Control. The Control of Machines by Perforated Records, Emanuel Scheyer. Am. Mach., vol. 55, no. 19, Nov. 10, 1921, pp. 743-747, 8 figs. Principles of pneumatic and electric control of machinery. Difficulties of automatic control. Machines controlled by paper records.

MANGANESE STEEL

Castings, Grinding. Grinding Manganese Steel Castings, F. B. Jacobs. Foundry, vol. 49, no. 19, Oct. 1, 1921, pp. 767-770, 8 figs. Frogs and switches produced from accurate patterns and carefully molded. Ground because too hard to machine Annealed before grinding. Wheels are coarse grit in hard grades.

MAPPING

Aerial Photography in. Aerial Photographic Mapping Developed for Municipal and other Engineering Services, Frederick E. Jones. Eng. News-Rec., vol. 69, no. 15, Oct. 13, 1921, pp. 596-599, 5 figs. Wide variety of uses includes traffic studies, street layout and waterfront development. Methods and equipment improved since war. Exposures made automatically.

MATERIALS

Testing. Testing Materials, T. W. MacAlpine, Eng. & Indus. Management, vol. 6, no. 18, Nov. 3, 1921; pp. 498-499. Plea is advanced for formation of a British National testing organization

MEASURING MACHINES

Internal Diameters. A Machine for the Measurement of Internal Diameters. G. A. Tomlinson. Engineering, vol. 112, no. 2912, Oct. 21, 1921, pp. 558-560, 6 figs. Describes method and machine developed at Nat. Physical Laboratory, Teddington, England, which is said to give high accuracy and allow inside diameter to be explored to any extent necessary.

METALLOGRAPHY

Microscopic Examinations. Metallography—The Microscopic Study of the Structure of Metals, Henry S. Rawdon. Am. Mach., vol. 55, no. 17, Oct. 27, 1921, pp. 659-664, 29 figs. Value of metallurgical science in industry; uses of the microscope. Study of metallic structures. Results of microscopic examinations.

Optics of. The Optics of Metallography, W. I. Patterson. Trans. Am. Soc. for Steel Treating, vol. 2, no. 2, Nov. 1921, pp. 108-132, 36 figs. Deals with important optical parts of microscopes.

METALS

Cold Work, Effect of. Strengthening Metals by Cold-Work, E. Heyn. Chem. & Met. Eng., vol. 25, no. 16, Oct. 19, 1921, pp. 735-736, 2 figs. Explains nature of changes in cold worked metal elastic and plastic deformation, etc. From Metall und Erz, 1918, Nos. 22 and 23.

Rolling. Metal Rolling (Le Laminage), Sigma, La Métallurgie, vol. 53, no. 40, Oct. 6, 1921, pp. 1884-1887. Discusses longitudinal or parrallel rolling; cross or circular rolling, i.e., reeling; and helicoidal or oblique rolling, as for Mannesmann tubes.

Structural Properties. Structural properties of Metals and Alloys, R. W. Woodward. Am. Mach.; vol. 55, nos. 15 and 16, Oct. 13, and 20, 1921, pp. 596-599 and 636-638, 2 figs. Applicability of metals; factors of strength and elasticity; compression; ductile and brittle materials; fatigue; thermal, Magnetic and optical properties; corrosion.

METRIC SYSTEM

Arguments Pro and Con. The Metric System of Weights and Measures, David A. Molitor, Jl. Eng. Inst. Can., vol. 4, no. 11, Nov. 1921, pp. 569-572. Advantages of system, legal problems, transition steps.

Metric versus English System. Eng. & Contracting, vol. 56, no. 18, Nov. 2, 1921, pp. 426-427, Summarizes points in favor and opposed to metric bill. Reprinted from Lefax.

MILLING CUTTERS

Formed. Formed Milling Cutters, George H. Strain, Machinery (Lond.), vol. 19, no. 474, Oct. 27, 1921, pp. 109-112, 18 figs. Factors in design which eliminate waste of driving power; cutting angles, rake and clearance of circular tools; standards for convex and concave formed milling cutting.

MILLING MACHINES

Rotary. Reducing Costs by Rotary Milling. Machy., (N.Y.), vol. 28, no. 3, Nov. 1921, pp. 202-205, 10 figs. Examples of work advantageously handled on Becker vertical rotary milling machines.

MONEL METAL

Welding. Monel Metal Welding, Michael Dzamba, Welding Engr., vol. 6, no. 10, Oct. 1921, pp. 41-42. Discusses welding generally, also welding of rods, sheets and castings, and soldering.

MOTOR BUSES

British Isles. Motor Bus and Motor Coach Transportation in the British Isles, Walter Jackson, Automotive Industries, vol. 45, no. 17, Oct. 27, 1921, pp. 827-831, 3 figs. Automotive vehicles are successfully competing with British railroads and tramways in both short and long haul passenger traffic.

MOTORSHIPS

Diesel-Engined. New Italian Motorships "Ardito" and "Primula". Motorship, vol. 6, no. 10, Oct. 1921, pp. 805-809, 4 figs. Describes Tosi Diesel engine equipments which gave excellent performance. Ardito is propelled by two four-cycle, single acting Tosi engines; Primula by two six-cylinder four-cycle engines. Deadweight 8000 and 3600 tons respectively; speeds 12 knots. See also Shipbldg., & Ship'g Rec. vol., 18, no. 13, Sept. 29, 1921, pp. 412-414.

MOTOR TRUCKS

Future. The Motor Truck of the Future, Rolin W. Hutchinson. Indus. Management, vol. 62., no. 5, Nov. 1921, pp. 257-261, 4 figs. What permanent highways, pneumatic tires and ferro-steel will do in revolutionizing motor-truck engineering.

N

NICKEL ALLOYS

Nickel-Aluminum-Copper. The Properties of Some Nickel-Aluminum-Copper Alloys, A. A. Read and R. H. Greaves. Metal industry (Lond),vol. 19, no. 13, Sept 23, 1921, pp 232-239, 23 figs. Discusses preparation; rolling and machining; tensile tests; properties of cast, cold-rolled and heat-treated alloys, etc. Paper read before Inst. of Metals.

NICKEL METALLURGY

Rolling. Rolling Pure Nickel, A. E. Surface. Sci. Am., vol. 125-A, no. 17, Nov. 1921, p. 34, 3 figs. Describes rolling of 99 per-cent pure nickel into the various shapes into which mild steel is rolled, according to method developed by Charles T. Hennig and carried out at plant at Hyde, Pa.

NUTS

Acme Thread. Making an accurate Acme Thread Nut, B. M. W. Hanson. Machy (N. Y.) vol. 28, no. 3, Nov. 1921, pp. 197-199, 4 figs. Notes on difficulty of obtaining proper contact between screw and nut; use of roughing and finishing taps; lubrication when tapping; holding an Acme tap in a turret lathe.

O

OIL ENGINES

Still. The Still Engine. Mar. Engr. & Naval Architect, vol. 44, no. 528, Sept. 1921, pp. 36-40, 4 figs. Describes engine which may be two-stroke or four-stroke type; burns gas, petrol or oil. Advantages, starting, overload, efficiency, etc.

OIL FUEL

Burning. The burning of Oil Fuel, Å. Keens. Mar. Engr. & Naval Architect, vol. 44, 529, October 1921, pp. 76-85, 12 figs. Discusses various types of machinery and its arrangement for burning oil fuel. Observations and comments derived from experience.

Handling. Security in Handling Inflammable Liquids Chem. Age (Lond.), vol. 5, no. 119, Sept. 24, 1921, pp. 372-373, 1 fig. Describes Mauciére patent for storage and protection of petrol which also permits distribution either in a continuous flow or in predetermined quantities.

Power Uses. The Application of Oil to Power Purposes, Sydney H. North. Trans. Inst. Mar. Engrs., vol. 33, Sept. 1921, pp. 325-331. Shows increase in water evaporated per lb. of oil, and in thermal efficiency of Diesel engines.

OIL STORAGE

Shipyard Plant. Shipyard Bulk Storage Oil and Paint Plant. Engineering, vol. 112, no. 2914, Nov. 4, 1921, p. 632, 10 figs. partly on p. 634. Describes installation at new yard of Furness Shipbuilding Co., designed with steel storage tanks and automatic measuring pumps for distribution of oils, layout being such as to reduce cost and increase ease of handling.

OILS

[illegible] Air [illegible] Baking [illegible] with Linseed Oil, A. A. Grubb and U. S. Jamison. Chem. & Met. Eng., vol. 25, no. 17, Oct. 26, 1921, pp. 793-795. [illegible] and plant experiments on consumption of air and oxygen [illegible] linseed oil [illegible] cores, together with a review of available [illegible] oxygen [illegible] by linseed oil in drying.

P

PARACHUTES

Aeronautical Life Belts. Parachutes. T. Orde Lees. Aviation ,vol. 11, nos. 16 and 17, Oct. 17 and 24, 1921, pp. 451-453 and 485-488, 5 figs. Discusses parachutes in the sense of aeronautical life-belts, for pilots and passengers. Lecture before Roy. Aeronautical Soc.

PAVEMENTS

[illegible] Strength of [illegible] Highway Department Makes Road Tests, Clifford Older and H. F. Clemmer. Automotive Industries, vol. 45, no. 15, Oct. 13, 1921, pp. 716-719, 6 figs. New devices used in research work to determine comparative strength of various types of road pavement. Uniformity of subgrade under each of sections of road discovered by observations for moisture content and bearing power of soil under static and impact loads.

PAVEMENTS, BITUMINOUS

[illegible] Bituminous Pavement Design.—Aggregate Survey, F. S. Besson Mun. & County Eng., vol. 61, no. 4, Oct. 1921, pp. 123-133, 8 figs. Results of investigations made in Dist. of Columbia show clearly that defects of bituminous pavements can not be charged entirely to deficient compaction, not to presence of smooth grains in aggregate, not to existence of rigid bases. Includes diagram showing bitumen requirements for pavements as controlled [illegible] and [illegible] gravity of mineral aggregate.

PAVEMENTS, WOOD-BLOCK

[illegible] The Minneapolis Experimental Wood Block Pavement After 15 Year's Service. Eng. & Contracting, vol. 56, no. 18, Nov. 2, 1921, pp. 415-417, 2 figs. Experimental pavement laid for purpose of studying relative merits of different species of wood for paving block material; effect of length of blocks on wearing qualities of pavement; influence of heartwood and sapwood on durability; and relative wear on blocks laid at different angles. Gives results [illegible] obtained.

PIPE, CAST-IRON

Manufacture. Cast-Iron Pipe. The Method of Manufacture and its Inspection, William R. Conrad. N. E. Water Works Assn., vol. 35, no. 3, Sept. 1921, pp. 205-220 and discussion) pp. 220-227, 6 figs. Discusses manufacturing [illegible] drying, pouring, cleaning and testing.

Standardized. Standardized Cast Iron Pipes. Eng. Production, vol. 3, no. 56, Oct. 27, 1921, pp. [illegible], 10 figs. Describes methods of Stanton Ironworks Co., Ltd., Nottingham, England, as example of advantages attendant on standardization [illegible] product.

PIPE, CONCRETE

Alkali Soils, in. Concrete Pipe in Alkali Soils. Pub. Works, vol. 51, no. 16, Oct. 15, 1921, pp. 292-294. Investigations made in Minnesota indicate that [illegible] liable to decomposition when water in surrounding soil contains [illegible] parts per million of alkali salts. Abstract Papers by Dalton [illegible] and [illegible] published in Bul. Minn. Federation of Architect[illegible]

PIPE, STEEL

Butt-Welded. Recent Improvements in the Manufacture of Welded Pipe, F. N. Speller, Blast Furnace & Steel Plant, vol. 9, no. 10, Oct. 1921, pp 580- 582. While there have been many improvements in appliances for butt-welding pipe since introduction of this process, the method of finishing has not been [illegible]

[illegible] A Hammer Welded Steel Pipe. Iron Age, vol. 108, no. 18, Nov. 3, 1921, pp. 1130-1131, 3 figs; also Iron Trade Rev., vol. 69, no. 18, Nov. 3, 1921, pp. 1148-1151, 7 figs. Product of Natural Tube Co., Pittsburgh. Steel plates are bent to require shape and overlapping edges are heated and welded under hammer. Hammer-weld process adapted to large sizes of pipe. Pro[illegible]

[illegible] Its Manufacture and Use. Eng. & Contracting [illegible] Notes on sizes and thickness, manufacturing process; physical properties of material; joints; elements of economy [illegible]

PISTONS

Aluminum, Machining. Precising Machine Work in the Production of Aluminum Pistons, J. Edward Schipper, Automotive Industries, vol. 45, no. 15, Oct. 13, 1921, pp. 722-725, 15 figs. Methods employed in manufacturing pistons for Essex engine. Special care exercised in machining piston pin-hole square with piston axis, and in aligning piston with cylinder bore.

Machining. Machining Hudson Super-Six Pistons. Machy. (N.Y.), vol. 28, no. 3, Nov. 1921, pp. 225, 227, 5 figs. Methods used by Hudson Motor Car Co. in producing pistons with high-production machinery at low cost.

PLATES

Stresses in Rectangular. Two Dimensional Stresses in Rectangular Plates, C.E. Inglis. Engineering, vol 112, no. 2910, Oct. 7, 1921, pp. 523-524, 3 figs. Outlines general analytical method for investigating two-dimensional distributions of stress set up in rectangular plate by stresses applied along its edges in any arbitrary manner.

POWER

Industrial, Analysis of. Analysis of Industrial Power, H. Goodwin. Power vol. 54, no.16, Oct. 18, 1921, pp. 584-588, 3 figs. Investigations based on latest census returns from North Atlantic States show more than 76,000 industrial plants, using in aggregate over 9,000,000 hp. of which over 2,000,000 hp. is supplied by steam engines, 600,000 by steam turbines, 540,000 by water power, 279,000 by internal-combustion engines, and remainder purchased power.

POWER GENERATION

Cost Systems. How to follow Up Power Costs, N. A. Graigue. Indus. Management, vol. 62. no. 5, Nov. 1921, pp. 275-279, 3 figs. Analysis and distribution of operating costs to consumers.

Fuel Economy. Fuel Economy by the Adoption of Scientific Management in Power Generation and Utilisation. David Brownie, Eng. & Indus. Management, vol. 6, nos.14, 15 and 16, Oct. 6, 13 and 20, 1921, pp. 393-394 and 396, 421-424, and 433-436, 13 figs. Notes on flue-gas analysis and boiler feedwater meters.

POWER PLANTS

Coal Mine. Mixed Pressure Turbine Installation with Regenerator Appreciably Decreases Power Costs at Nokomis, C. W. Smith. Coal Age, vol. 20, no. 19, Nov. 10, 1921. pp. 753-757, 7 figs. Describes very modern coal-mine power plant at Nokomis mine, Illinois, of Nokomis Coal Co.; capacity 1,300 kw. of which 1,000 kw. is mixed pressure and 300 kw. high-pressure turbine power.

Design. Developments in Power Station Design — XII, XIII and XIV. Engineer, vol. 132, nos. 3432, 3433 and 3435, Oct. 7, 14 and 28, 1921, pp 364-365-, 390-392 and 445-447, 13 figs. Oct. 7, Babcock boilers for utilization of waste heat from coke ovens and blast furnaces. Oct. 14: Halberg-Beth blast-furnace-gas-cleaning plant; Kirke waste-heat boiler with integral economizer; and waste-heat boilers with vertical tubes. Oct. 28: Describes Bonecourt gas-fired boiler unit; Thomson boilers operated with coke-oven gas; Brett drop-forging-furnace waste-heat unit; Babcock & Wilcox furnace for burning saw-mill refuse.

Modern Practice. Refinements of Practice in Modern Power Plants, I. L. Kentish-Rankin. Power Plant Eng., vol. 25, no. 20, Oct. 15, 1921, pp. 988-990. Discusses features regarding furnace construction and the overcoming of difficulties with superheater operation.

Superpower. The Performance and Cost of the Superpower System, Arthur R. Wellwood. Power, vol. 54, no. 19, Nov. 8, 1921, pp. 725-730, 10 figs. As result of work of Superpower Survey, certain vital facts concerning performance and cost of superpower system are presented, and conclusions drawn.

POWER TRANSMISSION

Machine Shops. Transmission of Power in Machine Shops, F. A. Pike. Mech. World, vol. 70, no. 1815, Oct. 14, 1921, p. 298, 3 figs. Advocates more direct driving.

PRESSES

Automobile Parts. Presses and Dies used in the Production of Motor-car Body Parts. Machinery (Lond.), vol. 19, no. 475, Nov. 3, 1921, pp. 117-121, 10 figs. Description of tools and machines used by Austin Motor Co., Ltd., Longbridge Works, Birmingham.

PRICES

Stop-Loss, Finding. Finding the "Stop Loss", Price Point, H. R. Boston, Indus. Management, vol. 62, no. 5, Nov. 1921, pp. 266-268. Definite way of estimating how far a price may be cut.

PULVERIZED COAL

Advantages and Disadvantages. Firing with Pulverized Coal (Le Chauffage au charbon pulvérisé), P. Frion. Mémoires et Compte Rendu des Travaux de la Société des Indénieurs Civils de France, vol. 74, nos.4-5-6-.April-June 1921, pp. 123-172. Report of Commission of Fuel Utilization, appointed by Minister of Pub. Works. Discusses actual developments in use of pulverized coal. Describes installation using it, its advantages and possibilities, and its inconveniences and dangers.

See also Revue [illegible] des Mines, vol. 11, no. 1, Oct. 1, 1921, pp. 48-56.

BOILER FIRING. Burning Powdered Coal and Blast Furnace Gas at River Rouge, Thomas Wilson. Power, vol. 54, no. 18, Nov. 1, 1921, pp. [illegible] figs. Arrangement and construction of [illegible] coal equipment and layout of gas-piping and burners. [illegible] and operating force required.

PUMPING

CENTRIFUGAL AND AIR-LIFT. Modern Pumping [illegible] vol. 132, no. 3170, Sept. 30, 1921, pp. [illegible]. Paper on "Modern High Speed Centrifugal Pumps" by S. F. Barclay and paper on Experiments on Air Lift Pumping by I. S. Owens. Read before British Assn.
See also [illegible].

PUMPS, CENTRIFUGAL

DESIGN AND APPLICATION. The Centrifugal Pump, S. F. Barclay. Engineering, vol. 112, no. 2914, Nov. 4, 1921, pp. 642-644, 8 figs. Notes on Mechanical design and application. (Abstract) Paper read before British Ass.

MANUFACTURE. Manufacturing Centrifugal Pumps. Western Machy., World, vol. 12., no 10, Oct. 1921, pp. 392-395, 12 figs. Describes machine operations on pump bases, brackets, spiral bodies, impellers, etc.

R

RADIOTELEGRAPHY

STATIONS. The Most Powerful Radio Station in the World (La plus puissante station radio-électrique du monde), L.-V. Bournat. La Technique Moderne, vol. 13, no. 2, Feb. 1921, pp. 49-54, 24 figs. Describes French station at Saint-Assise near Melun and German Stations at Nauen and compares their operation.

RAILS

MAGNETIC SURVEYS. Magnetic Surveys of Railroad Rails, Iron Age, vol. 108, no 20, Nov. 17, 1921, pp. 1271-1273 7 figs. Determination of fissures obscured by heavy damage from gagging presses. Improvements being made in section and in straightening.

SECOND-HAND, USE OF. Classificatiom and Distribution of Second Hand Rail for Use in Track. Eng. & Contracting, vol. 56, no. 20, Nov. 16, 1921, pp. 463-464. Notes on supply and demand for used rail; variables to be considered in use of rail, recommended method of assigning and distributing rail.

RAILWAY ELECTRIFICATION

BRAZIL. The Paulista Railway Electrification. S. B. Cooper, Ry. Rev., vol. 69, no. 16, Oct. 15, 1921, pp. 507-509, 8 figs. Describes Westinghouse equipment recently delivered and conditions making electrification desirable.

HEAVY TRACTION. Electrification Report of the A. E.R.A. Ry. Elec. Engr., vol. 12, no. 10, Oct. 1921, pp. 391-396, 1 fig. Report of Committee of the Am. Elec. Ry. Assn. on heavy electric traction. Compares locomotives and multiple unit cars. (Abstract).

ITALY. Electrification Progress on Italian Railways, Giovanni B. Santi. Ry. Elec. Engr., vol. 12, no. 10, Oct. 1921, pp. 371-375, 6 figs.Discusses development of electrification on account of high price of coal and no oil resources. The Valtelline, three-phase, 15-cycle, 3000 volt system has been working for 20 years.

SWISS. The Electrification of the Swiss Federal Railways — III Engineer, vol. 132, no. 3433, Oct. 14, 1921, pp. 389-390. Sets forth advantages of single-phase system which, it is stated, have been completely confirmed by results of the St. Gothard and Lötschberg lines. Address and more recent observations by Dr. Wyssling.

RAILWAY MOTOR CARS

GASOLINE. Petrol Rail Motor Cars, Kalka-Simla Railway. Ry. Gaz., vol. 35, no. 15, Oct. 7, 1921, pp. 535-539, 7 figs. Describes car for narrow gauge mountain service in India under severe working conditions, due to steep inclines and many sharp curves. Design includes several noteworthy features particularly gearing and transmission, frame construction and combination of coupled wheels and radial trucks to give flexibility on curves.

RAILWAY OPERATION

AUTOMATIC TRAIN CONTROL. Automatic Safety Apparatus and Automatic Train Control (Appareil automatique de sureté et de contrôle des trains). Maurice Gouineau. Revue Générale de l'Electricité, vol. 10, no. 12, Sept. 24, 1921, pp. 406-412, 10 figs. Describes Regan System as adapted to French railroads.
Cab Signalling and Automatic Stopping of Trains (La répétition des signaux sur les machines et l'arrêt automatique des trains), J. Netter. La Technique Moderne, vol. 13, no. 3, March 1921, pp. 101-104, 7 figs. Criticism of Regan system recently tested on Paris-Dreux line; comparison with Rodolausse apparatus; systems used by principal French railroads.

INTERCHANGE OF ROLLING STOCK. On the Question of Interchange of Rolling Stock, C. W. Crawford. Bulletin International Ry. Ass., vol. 3, no. 9, Sept. 1921, pp. 1275-1321. Discusses the question as it affects United States, Canada and Mexico. Gives summary of their regulations and practices, also answers to questions sent. Appendixes.

RAILWAY REPAIR SHOPS

CONTRACT SHOP, VS. The Cost of Contract vs. Railway Shop Repairs, J. W Roberts. Ry. Age, vol. 71, no. 16, Oct. 15, 1921, pp. 729-731, 2 figs. Total cost to railroad was 28 per cent greater in its own shop than in a contract shop.

[illegible]. An Experiment in Railroad Repair Work, Fred H. Colvin. Am March, vol. 55, no. 20, Nov. 17, 1921, pp 807-808. Securing greater interest by local management. Improved machinery and buildings. Describes scheme adopted by Erie R.R. at Hornell, N.Y.

REQUIREMENTS. The Requirements for a Modern Car Repair Shop, H. H. Dickinson and Paul Schioler. Ry. Age, vol. 71, no. 19, Nov. 5, 1921, pp. 890-893, 3 figs. Type of building, character of tools and general plan for both steel and wood equipment.

RAILWAY SHOPS

MACHINE TOOLS FOR. Railway Shop Machine Tool Equipment. British Machine Tool Eng., vol. 1, no. 2, September-October 1921 pp. 277-399, 188 figs. A series of articles on railway shop equipment, including locomotive boiler shop, wheel and axle shop, frame shop, spring shop, grinding shop, general machine shop, capstan and turret lathes, carriage and wagon frames, girder work, etc.

RAILWAY SIGNALING

ALTERNATING-CURRENT. Principles of Alternating Current Signaling, John S. Holliday. Ry. Signal Engr., vol. 14, no. 11, Nov. 1921, pp. 443-45, 9 figs. Explanation of motor and generator motion and transformer action that produces rotation in an induction motor.

BLOCK SYSTEM. Absolute Permissive Block Signal System, C. A. Dunham. Ry. Signal Engr., vol. 14, no. 11, Nov. 1921, pp 438-440, 7 figs. Study of single track signalling showing track layout and circuit diagram and explaining operation of trains between sidings. (Abstract.) Paper read before Kansas City Sectional Committee Meeting.

ELECTRIC. Principles of Alternating Current Signaling, John S. Holliday. Ry. Signal Engr., vol. 14, no. 10, Oct. 1921, pp. 389-390, 12 figs. Explaining an easy method of constructing vector diagrams and the application to track circuit problems.

PROGRESS, AMERICA. Progress of Railroad Signaling in America, H. S. Balliet. Ry. Signal Engr., vol. 14, no. 11, Nov. 1921, pp. 433-437. Detailed history of apparatus and methods used from the days of the smoke blanket to present efficient systems. Paper delivered before N.Y. Signal Sectional Committee.

RAILWAY TIES

HANDLING AND RENEWAL. The Handling and Renewal of Ties. Eng. & Contracting, vol. 56, no. 16, Oct. 19, 1921, pp. 379-380. Notes on estimates for tie renewals, supply and distribution of ties, application of ties in track, and piling and disposition of old ties. Committee report before Roadmasters & Maintenance of Way Assn.

RAILWAY TRACK

CONCRETE SUPPORTS. Concrete Block Track Supports on Italian Railways. Eng. News-Rec., vol. 87, no. 17, Oct. 27, 1921, pp. 689-690, 2 figs. Fixed and rocking blocks placed longitudinally have rail seats at each end. Rockers insure vertical loading.

MAINTENANCE. Distributing Expenditures in Track Maintenance, J. L. Starkie. Ry. Maintenance Engr., vol. 17, no. 11, Nov. 1921, pp. 403-405, 4 figs. Gulf, Colorado & Santa Fe is obtaining increased interest and efficiency by means of new work records
Advantages of Budget System for Track Work, C. A. Morse. Eng. & Contracting, vol. 56, no. 16, Oct. 19, 1921, pp. 370-372. Points out that there should be a carefully prepared budget made up in fall of year including all probable expenditures of coming year outside of ordinary upkeep of track and roadbed. Apportioning amounts covered by budget. Paper presented before Roadmasters & Maintenance of Way Assn.

TURNTABLES. Twin-Span Turntables on the Chesapeake & Ohio. Ry. Rev., vol. 69, no. 18, Oct. 29, 1921, pp. 563-568, 12 figs. Particulars of design and advantages to be realized in use of this type of turntable. Length 100 ft., carrying capacity 450 tons; built by Bethlehem Bridge Corp.; used for heavy Mallet type of locomotives.

RAILWAYS

CONSOLIDATION. Consolidation of Railroads. Ry. Rev., vol. 69, no. 14, Oct. 1, 1921, pp. 423-437, 29 figs. Proposed consolidation of railroad properties of United States into a limited number of systems. Tentative plan of interstate commerce commission based upon Ripley report.

SHANGHAI-NANKING. Notes on the Shanghai-Nanking Railway. Ry. Gaz., vol. 35, no. 18, Oct. 28, 1921, pp. 637-638, 3 figs. Describes general characteristics, standard gage, high-capacity rolling stock, train control, train service, buildings, etc.

REFRACTORIES

FIRECLAYS. Effect of Impurities in Fire Clays, C. E. Bales. Brick & Clay Rec., vol. 59, no. 10, Nov. 15, 1921, pp. 723-725. Points out that high-grade fireclays must be akin to kaolin. Explains coloration processes and neutralizing of harmful ingredients.

FURNACE LINING. Carborundum Linings for Brass Furnaces, M. L. Hartmann Can. Foundryman, vol. 12, no. 10, Oct. 1921, pp. 34-35. Explains how carborundum refractories are applied to problems in crucible, tilting or rotary, and reverberatory furnaces, with records of certain installations. Paper read at Foundrymen's Convention.

RECTIFIERS

MERCURY-ARC Large Mercury Arc Rectifiers. Elec. Rev. (Lond.), vol. 89, no. 2290, Oct 14, 1921, pp 492-493, 3 figs Describes Brown-Boveri rectifier equipments installed at Ipswich, Birmingham and Wolverhampton; capacities, 120 kw at 470-475 volt with primary three-phase a.c at 3000 volts and 50 cycles, and 500 amps at 450 volts with primary three-phase 5000 volts and 25 cycles.

REFUSE DISPOSAL

INCINERATORS FOR MILL. Incinerator for Mill Refuse Made of Brick and Concrete. Eng. News-Rec., vol. 87, no. 18, Nov. 3, 1921, pp. 727-728, 1 fig. Consists of concrete shell with fire brick lining, 14 ft. in diam. at base and 60 ft. high, built at cost of $6000. Air vents and expansion joints increase life of materials under high heat.

RIVETED JOINTS

EFFICIENCY. A Criticism of High Efficiency Riveted Joints, John S. Watts. Boiler Maker, vol. 21, no. 10, Oct. 1921, pp. 278-279, 3 figs. Calculations indicate that use of multiple riveted joints does not increase seam efficiencies.

ROAD CONSTRUCTION

STANDARD COST ESTIMATE. Standard Estimate of Cost Form for Road Construction. Eng. & Contracting, vol. 56, no. 18, Nov. 2, 1921, pp. 410-411. Presents standard estimate of cost form prepared by Kentucky Assn. Highway Contractors, in which it is attempted to place squarely before bidder every item of cost ordinarily encountered.

ROADS

SUBGRADE DRAINAGE. Bureau of Roads' Subgrade Drainage Tests Give Inetresting Data. Ira B. Mullis Eng. & Contracting, vol. 56, no. 18, Nov. 2, 1921, pp. 407-409, 3 figs. Account of results obtained from subgrade drainage experiments in progress at Arlington, Va., since fall of 1920. Abstracted from Public Roads.

WATERPROOFING SURFACES. Waterproofing Road Surfaces. Can. Engr., vol. 41, no. 17, Oct. 27, 1921, pp. 4 and 9. Discussion before Eng. Inst. of Can. on present methods of obtaining waterproof roadway surfaces.

ROADS, CONCRETE

CENTRAL MIXING. Central Mixing for Concrete Roads, C S Hill Eng. News-Rec., vol. 87, no. 16, Oct. 20, 1921, pp. 636-637. Conclusions of two years' experience in concrete road construction by central mixing and wet-batch haulage show that where conditions favor their use, they are an economical method of concrete road construction

DOUBLE-SLAB. New York Develops Double-Slab Concrete Roads. Eng. News-Rec., vol. 77, no. 20, Nov. 17, 1921, pp. 804-805, 4 figs. Parallel concrete slabs separated by macadam give three-way road at cost of single two-way slab.

NEW CONSTRUCTION METHOD. A New Method of Making Concrete Roads. Engineer, vol. 132, no. 3435, Oct. 28, 1921, pp. 465-466, 4 figs. In system patented by J. H. Walker , he adopts principle of laying concrete in alternate bays, and not filling in intervening spaces until material in bays has set and undergone greater part of its contraction; he furthermore makes edges of bays accurately vertical by means of special formers which are described.

REINFORCING STEEL FOR. Reinforcing Steel for Road Use, Charles W. Geiger. Iron Age, vol. 108, no. 19, Nov. 10, 1921, pp. 1222-1223, 8 figs. Test highway built by Columbia Steel Co., to study methods of reinforcement. Special device for laying steel.

ROADS, MACADAM

RESURFACING. Resurfacing and Treating of Macadam Roads, T. J. Wasser. Can. Engr., vol. 41, no. 17, Oct. 27, 1921, pp. 10, 11 and 12. States that Resurfaced roads must be underdrained to allow escape of sub-surface water. Specifications for converting road foundations for bituminous pavements.

ROLLING MILLS

BAR MILLS FOR ALLOY STEEL. Adapts Bar Mills to Alloy Steel, J. D. Knox. Iron Trade Rev., vol. 69, no. 20, Nov. 17, 1921, pp. 1275-1281, 12 figs. New 12 and 18-in. merchant units installed by Ohio steelmaker rounds out rolling equipments. Unique guide box prevents scrap loss. Rolls adjusted by set screws. Description of mills.

ELECTRICALLY DRIVEN. Some Methods of Obtaining Adjustable Speed With Electrically Driven Mills. K. A. Pauly. Proc. Engrs.' Soc. of Western Pa., vol. 37, no. 3, April 1921, pp. 158-178 and (discussion) 179-188, 19 figs. Discusses rolling mill practice, speed of rolling and systems of speed control.

S

SCIENTIFIC MANAGEMENT

See Industrial Management.

SEMI-DIESEL ENGINES

OPEN-CRANKCASE. The Open-Fronted Surface Ignition Engine, F. G. Butt-Gow. Trans. Inst. Mar. Engrs., vol. 33, Sept. 1921, pp. 239-269 and (discussion) 270-279, 22 figs. Discusses closed and open engines and compares cost of manufacture, running, overhauling lubrication, etc. Describes various types of open-crankcase engines.

SEWAGE

SCREENS, REINSCH-WURL. Tests of Reinsch-Wurl Screens at Dyckman St. Sewage Screening Plant, New York, Kenneth Allen. Eng. & Contracting, vol. 56, no. 19, Nov. 9, 1921, p. 434. Results of tests with day and night sewage, indicate that screen with 1116-in. slots will remove about 7110 as much material under given conditions as screen with 3164-in. slots. (Abstract) Paper read before Am. Soc. Mun. Improvements.

TRICKLING FILTERS. Non-Bacterial Population of Sewage Trickling Filters, Charles R. Cox. Eng. News-Rec., vol. 87, no. 18, Nov. 3, 1921, pp. 720-725. Review of literature and observations at three Maryland plants indicate that vegetable growths are more harmful than helpful and animal growths harmless or beneficial. Methods of control.

SEWAGE DISPOSAL

IMHOFF TANKS. Operations of Imhoff Tanks at Fitchburg, Mass. David A. Hartwell. Eng. & Contracting, vol. 56, no. 19, Nov. 9, 1921, pp. 439-441. Data on operation of sewage-disposal plant including five Imhoff tanks each 30 by 90 ft. in plant and 26 ft. deep. Notes on cleaning and sludge disposal of tanks, trickling filter, etc.

LOW SEWER GRADES AND. Sewer Grades and Sewage Disposal, Arthur J. Martin. Eng. News-Rec., vol. 87, no. 16, Oct. 20, 1921, pp. 638-640. British view on dilution standards, activated by spiral movement, low sewer velocities and sewage utilization.

SLUDGE REMOVAL. Sludge Removal at Sewage Disposal Plant at Rochester, N.Y., N. Adelbert Brown. Eng. & Contracting, vol. 56, no. 19, Nov. 9, 1921, pp 144. Notes on cost of sludge removal and use of sludge as fertilizer. Paper read before Am. Soc. Mun. Improvements.

SHAPERS

TOOLROOM WORK. A New Shaping Machine. Eng. Production, vol. 3, no. 55, Oct 20, 1921, p. 372, 3 figs. Describes machine introduced by the Butler Machine Tool Co., Ltd., Halifax, designed especially for toolroom work.

SHIP DESIGN

DOUBLE BOTTOM. A New System of Double-Bottom Construction. Shipbldg. & Shipg. Rec., vol. 18, no. 12, Sept. 22, 1921, pp. 368 and 373-374, 4 figs. Detail of G. A. system developed by D. B. Gebbie and T. B. Abell.

SILICA BRICK

MANUFACTURE. Experimental Work in Connection with the Manufacture of Silic Brick, A. W. McMaster. Jl. Eng. Inst. Can., vol. 4, no. 11, Nov. 1921, pp 561-565, 6 figs. Development of new industry in Nova Scotia by Dominio Iron & Steel Co. Ltd.

THERMAL EXPANSION Reversible Thermal Expansion of Silica, H. S. Houldsworth and J. W. Cobb. Iron & Coal Trades Rev., vol. 103, no. 2797, Oct. 1921, pp. 508-509. Describes experiments with commercial silica bricks, rat of expansion at various temperatures; layer formation in bricks; et (Abstract) Paper read before Refractory Matls Section of Ceramic So

SPRINGS

COIL. The Manufacture of Coil Springs, A. W. Allen. Machinery (Lond.), vo 19, no. 474, Oct. 27, 1921, pp. 85-89, 17 figs. Coiling machines; open cc barrel springs; press operations; eye forming; cutting, eyeing and bowing.

COMPRESSION. Nested Steel Compression Springs, T. F. Stacy. Am. Mach vol. 55, no. 20, Nov. 17, 1921. pp. 795-796, 2 figs. Deals with design of co centric springs so proportioned that all springs are worked to maximum fib stress.

DESIGN. The Design of Springs, Joseph Kaye Wood. Am. Mach., vol. 55, no. 1 Oct. 27, 1921, pp. 674-677, 10 figs. Control of the "spring criterion" Fc mulas for leaf springs constrained at one or both ends. Characteristics of co spiral and buffer springs.

A general Method for Spring Design, Joseph Kaye Wood. Am. Mach vol. 55, no. 19, Nov. 10, 1921, pp. 757-762, 3 figs. Types of springs. Ec nomy index and load-deflection rate. General formulas and table of co stants Parallel scale chart Importance of material index.

STANDARDIZATION

AUTOMOBILE INDUSTRY. Industrial Standardization, Geo. W. Watson. Automob Engr., vol. 11, no. 155, Oct. 1921, pp. 356-358. Advocates more standa ization in British automobile industry, including agricultural tractors, e Résumé of presidential address before Instn. of Automobile Engrs.

STANDARDS

GERMAN V D I REPORT. Report of the German [illegible] Standards. Mitteilungen des Normenausschusses der Deutschen Industrie. Betrieb, vol 3, no 25, Sept 15, 1921, pp 367-379, 18 figs. [illegible] cylinder, round-head, and countersunk [illegible] Board of Directors for drawings for recording dimensions; straight wooden stairs for small dwellings, window and door [illegible].

Report of the German Industry Committee on Standards. Mitteilungen des Normenausschusses der Deutschen Industrie. Betrieb, vol. 3, no. 26, Sept. 25, 1921, pp 393-406, 21 figs. and supp. [illegible] Proposals of Board of Directors for ball bearings. Proposed [illegible] for boiler and structural steel work, [illegible] and countersunk, oval heads.

STEAM

CALLENDAR EQUATIONS. The Callendar Equations for Steam, Gerard Stoney. Beama, vol 9, no 4, Oct 1921, pp 345-350 [illegible] figs. Abstract of some of the best and easiest ways in which to use these equations with special reference to steam turbine practice.

PRODUCTION AND DISTRIBUTION ACCOUNTING. Accounting for Steam Production and Distribution, A. R. Smith. Power, vol. 54, no. 17, Oct. 25, 1921, pp. 630-633, 1 fig. Describes two forms of balance sheets and enumerates possible losses which can be detected by their use. Ways and means and advantage of metering boiler outputs.

STEAM-ELECTRIC PLANTS

DIAGRAMMATIC RECORDING IN. How Can the Executive Keep in Touch with Plant Economy? C. H. Delany. J. Electricity & Western Industry, vol. 47, no. 7, Oct. 1, 1921, pp. 267-268, 4 figs. Diagrammatic method of recording results in operation of a steam electric power plant.

STEAM ENGINES

UNIFLOW. A 200 hp. Uniflow Steam Engine. Power House, vol. 14, no. 18, Sept. 20, 1921, pp. 21-23, 4 figs. Built by Galloways Ltd., Manchester. Has a novel high-speed valve gear and compression release.

See also Locomotives.

STEAM PIPES

REDUCING RESISTANCES IN. Economies Obtainable by Reducing Resistances in Steam Piping. O. Denecke. Mech. Eng., vol. 43, no. 11, Nov. 1921, pp. 735-738, 2 figs. Discussion of general principles on which design of steam piping in power plants should be based, with comparison of formulas suggested for various elements affecting steam consumption as function of resistances encountered to flow of steam. Translated from Zeit. für Dampfkessel u Maschinenbetrieb.

STEAM POWER PLANTS

MODERN DESIGN. Modern Steam Power Station Design. Frank S. Clark. Jl. Franklin Inst., vol. 192, no. 4, Oct. 1921, pp. 413-452, 11 figs. Notes on present status of turbine design; economical and mechanical features of station design; operation of plant.

STEEL

ARTIFICIAL SEASONING. Artificial Seasoning of Steels. H. J. French. Am. Mach., vol. 55, no. 19, Nov. 10, 1921, pp. 768-771. Review of available data on length changes and spontaneous generation of heat in hardened steels. Results of preliminary experiments on artificial seasoning. Printed by permission of Bur. of Standards.

AUTOMOBILE GEAR. Investigation of Tooth Wear With Various Gear Steels. E. R. Ross. Automotive Industries, vol. 45, no. 18, Nov. 3, 1921, pp. 865-869, 10 figs. Steel with minimum of 0.45 carbon that is capable of treatment giving a scleroscope hardness of 75 or over is recommended for oil treating. Specification limits should be close enough to insure uniform results from a standard heat treatment.

BAR, WEIGHT OF. Estimating the Weight of Bar Steel. Hyman. Iron Age. Machy. (N.Y.), vol. 28, no. 3, Nov. 1921, p. 190. Formulas for calculating approximate weights of various sections and lengths of steel.

CAST, CARBONIZING PARTS. The Carbonizing of Cast Steel Parts, William G. Conner. Trans. Am. Soc. for Steel Treating, vol. 2, no. 2, Nov. 1921, pp. 148-149. Writer finds that all parts or pieces should be cooled in pots to atmospheric temperature.

CAST, IMPACT TESTS ON. Study Impact Tests on Cast Steel. [illegible] Iron Trade Rev., vol. 69, no. 18, Nov. 3, 1921, pp. 1145-1147 and 1154, 6 figs. Results of investigations on cast steels of varied compositions and heat treatments. Higher shock strength is shown to be obtained from low phosphorus material.

IMPACT PROPERTIES. Impact Properties of Various Steels. [illegible] Chem. & Met. Eng., vol. 25, no. 20, Nov. 16, 1921, pp. 910-912, 5 figs. Cylinders of steel, centrifugal cast, were sectioned and tested, a set of steel bars, with increasing carbon content, and some steel casting were tested after various heat-treatments; comparison of impact for forged and cast steels.

NITROGEN IN CARBURIZED. Nitrogen in Carburized Steels, W. E. Ruder and G. E. Brophy. Chem. & Met. Eng., vol. 25, no. 19, Nov. 9, 1921, pp. 867-871, 7 figs. Describes micrographic methods for detection of nitrogen compounds.

PROPERTIES. The Properties of Steel. Eng. Production, vol. 3, no. 57, Nov. 3, 1921, pp. 417-418, 1 fig. Notes on influence of various elements.

STAINLESS. Stainless Steel in Engineering. Eng. & Ind. Management, vol. 2, no. 17, Oct. 27, 1921, pp. 466-467, 2 figs. Describes demonstration at Thos. Firth's & Sons, Sheffield, England, showing behavior of turbine blades, made from stainless steel under working conditions. See also Eng. Production, vol. 3, no. 56, Oct. 27, 1921, p. 405, 2 figs.; Engineering, vol. 112, no. 2913, Oct. 28, 1921, pp. 592-594, 7 figs.; and Engineer, vol. 132, no. 3435, Oct. 28, 1921, pp. 447-450, 7 figs.

See also Iron and Steel; Chromium Steel; Manganese Steel; Vanadium Steel.

STEEL CASTINGS

HEAT TREATMENT. Heat Treatment Improves Castings, Martin M. Rock. Foundry, vol. 49, no. 20, Oct. 15, 1921, pp. 797-799. Tensile tests of unannealed, air cooled and water quenched steel castings do not disclose marked difference in strength but impact tests show water-quenched product excels others.

STEEL, HEAT TREATMENT OF

HARDENING. Discussion of the Hardening of Steel and other Alloys, Oscar E. Harder. Trans. Am. Soc. for Steel Treating, vol. 2, no. 2, Nov. 1921. pp. 139-147, 1 fig. With particular emphasis on important part played by solution and precipitation.

HARDNESS VARIATIONS. Hardness Variations in Heat-Treated Steel, Carle R. Hayward. Chem. & Met. Eng., vol. 25, no. 15, Oct. 12, 1921, pp. 695-696. Gives some tables of figures for shore center and half-way tests showing greater hardness in center.

INFLUENCE OF MASS. A Contribution to the Problem of the Influence of Mass in Heat Treatment, E. J. Janitzky. Trans. Am. Soc. for Steel Treating, vol. 2, no. 1, Oct. 1921, pp. 55-62, 3 figs. Writer seeks to show that law which relation of mass has to physical properties exists and can be determined mathematically.

QUENCHING. Efficiency of Various Quenching Mediums With Their Practice and Applications, James B. Morey. Trans. Am. Soc. for Steel Treating, vol. 2, no. 1, Oct. 1921, pp. 63-69, 4 figs. Discusses effect of brine, oil, sperm, lard, [illegible] or salt water.

STEEL, HIGH-SPEED

ELECTRIC TOOL. Features of Electric Tool Steel Practice, W. J. and S. Stuart Green. Iron Age, vol., 108, no. 17, Oct. 27, 1921, pp. 1061-1064, 3 figs. Points out that Standardized shop practice is necessary. Large ingots are recommended. Top pouring preferred for tool steel.

TREATMENT. How to Make the Most out of High Speed Steel, A. J. Wilson. Can. Machy., vol. 26, no. 13, Sept. 29, 1921, pp. 35-36. Steel must be heated uniformly. Tools should not be hardened direct from forging operation. Should be annealed.

TUNGSTEN CONTENT, EFFECT OF. Effect of Tungsten Content on the Specific Gravity of High Speed Steel, Arthur S. Townsend. Trans. Am. Soc. for Steel Treating, vol. 2, no. 2, Nov. 1921, pp. 133-138. Observations made in writer's laboratory tend to establish general rule for annealed steels that the higher the tungsten content the higher the specific gravity.

STEEL MANUFACTURE

ENAMELED STEEL. Enameled Steel Manufacture, Chester H. Jones. Chem. & Met. Eng., vol. 25, no. 19, Nov. 9, 1921, pp. 883-886, 9 figs. Development of glass-lined steel containers; fabricating and finishing the steel; mixing and firing the enamel.

STEEL WORKS

ELECTRICAL DEVELOPMENT IN. Electrical Development in Steel Mills, R. B. Gerhardt. Iron Age, vol. 108, no. 18, Nov. 3, 1921, pp. 1135-1136. Report of progress during past year. Advance in control equipment.

FRENCH, REBUILDING. French Modernize in Rebuilding, L. Guillet. Iron Trade Rev., vol. 69, no. 18, Nov. 3, 1921, pp. 1152-1154. Better equipment than was used before installed in iron and steel works. Products of American engineering skill used in some plant. Résume of restoration, (Abstract.) Paper before British Iron & Steel Inst.

STELLITE

USE FOR CUTTING TOOLS. Stellite and Its Use for Cutting Tools (Le "Stellite" et son emploi pour les outils de tour). L'Ouvrier Moderne, vol. 4, no. 6, Sept. 1921, pp. 227-230, 26 figs. Properties of stellite, degrees of hardness, operating tools, etc.

STOKERS

ELVIN MECHANICAL. Distinctive Features of the Elvin Mechanical Stoker. Ry. & Locomotive Eng., vol. 34, no. 10, Oct. 1921, pp. 259-264, 10 figs. Details of its construction and operation, and improvements made without changing fundamental principles of its design. Applied to Mallet locomotives.

STREET RAILWAYS

PAVEMENT AND TRACK SPECIFICATIONS. Proposed Specifications for Street Railway Pavements and track Construction, Charles E. De Leuw. Eng. & Contracting, vol. 56, no. 18, Nov. 2, 1921, p. 412. Specifications proposed by committee before Am. Soc. Mun. Improvements.

SWITCHBOARDS

METER CONNECTIONS. Switchboard-Meter Connections — Common Types of Alternating-Current Instruments, E. A. Reinman. Power, vol. 54, no. 17, Oct. 25, 1921, pp. 625-628, 12 figs. Wiring for frequency meters, power- and reactive-factor meters and synchroscopes on single- and three-phase circuits.

T

TERMINALS, RAILWAY

SNOW AND ICE HANDLING. Handling Snow and Ice in Railway Terminals, J. J. Navin. Eng. & Contracting, vol. 56, no. 20, Nov. 16, 1921, pp. 462-463. (Abstract.) Paper read before Maintenance of Way Club of Chicago.

TEXTILE MACHINERY

CONSTRUCTION. Machining Operations on Textile Machine Parts. Machinery (Lond.), vol. 19, no. 473, Oct. 20, 1921, pp. 57-62, 14 figs. Review of methods employed by British Northrop Loom Co., Ltd., Daisyfield, Blackburn.

TEXTILE MILLS

VENTILATION. Ventilation and Humidification of Textile Factories, H. N. Leask. Domestic Eng. (Lond.), vol. 41, no. [illegible], Oct. 1921, pp. 155-159, 1 fig. Describes an apparatus designed by A. B. Cleworth meeting all the requirements of humidity and ventilation, etc. Extract from paper read before Rochdale Cotton Spinners' Mutual Improvement Soc.

TIDAL POWER

SYSTEM FOR UTILIZING. Long Distance Transmission of Electrical Energy with Special Reference to Tidal Power, T. F. Wall. Engineering, vol. 112, no. 2912, Oct. 21, 1921, pp. 587-588, 3 figs. Preliminary outline of system obviating difficulty of varying speeds of turbines, permitting use of a-c. generators driven directly from turbines and offering other advantages. Paper read before British Assn.

TIMBER

JOIST AND RAFTER SPANS. Maximum Joist and Rafter Spans, L. P. Keith. Contract Rec., vol. 35, no. 45, Nov. 9, 1921, pp. 972-973. Presents tables which facilitate determination of lengths of timbers for load conditions encountered in ordinary construction.

STRUCTURAL, DECAY IN. The Cause and Prevention of Decay in Structural Timber, R. J. Blair. Jl. Eng. Inst. Can., vol. 4, no. 11, Nov. 1921, pp. 565-568, 6 figs. Fungus is said to be cause of timber decay; factors influencing growth of fungus; methods for preventing decay and preserving timber.

TIME STUDY

STOP-WATCH. Stop Watch Time Study. Does It Promote Industrial Efficiency? Eng. & Indus. Management, vol. 6, nos. 16 and 17, Oct. 20 and 27, 1921, pp. 437-440 and 463-465. Oct. 20: An indictment of the Stop Watch, by Frank B. and L. M. Gilbreth. Defense of stop watch by Carl G. Barth and Dwight V. Merrick in discussion held under auspices of Taylor Society.

TRACTORS

NEW MODELS. British Tractor Trials Develop Interesting Engineering Features, M. W. Bourdon. Automotive Industries, vol. 45, no. 17, Oct. 27, 1921, pp. 817-822, 13 figs. American-made machines received favorable comments and a number of new models were introduced at British exhibitions.

TUBES

COPPER. Copper Tubes Produced by Cold Extrusion Process, A. Ludlow Clayden. Raw Material, vol. 4, no. 9, Sept. 1921, pp. 314-315, 5 figs. Describes method of producing thin-wall copper tubes, developed from experience gained in the production of rifle shells during war.

SEAMLESS COPPER. Copper Tube Extrusion and the Manufacture of Radiator Cores, Herbert Chase. Automotive Industries, vol. 45, no. 18, Nov. 3, 1921, pp. 870-873, 8 figs. How seamless tubes are formed from solid stock by cold extrusion, shaped with hex ends and baffles, tested under pressure and finally assembled and soldered into complete radiator cores. Describes apparatus for determining relative efficiency of various types of cores.

WELDED MANUFACTURE. Welded Tube Manufacture Iron Age, vol. 108, no. 20, Nov. 17, 1921, pp. 1274-1276, 7 figs. Machinery required for tubes ⅜ to 4 in. in diam. from sheets of no. 10 and no. 22 gage.

TUNNELS

LINING. Lining Tunnels Under Traffic. Ry. Maintenance Engr., vol. 17, no. 11, Nov 1921, pp. 415-418, 3 figs. Discusses hand method and pneumatic method; describes some pneumatic lining done by Southern Pacific; details of operations and cost.

LINING RAILWAY. Methods of Lining Railway Tunnels Under Traffic. Eng. & Contracting, vol. 56, no. 20, Nov. 16, 1921, pp. 456-459. Notes on lining tunnels by hand methods and by pneumatic method; getting aggregate to mixer; mixer plant; placing concrete; labor organization and cost. Methods employed by different railroads. Committee report before Am. Ry. Bridge & Building Assn.

U

UNEMPLOYMENT

[illegible]. What Construction Can Do for the Unemployed, R. C. Marshall. Eng. & Contracting, vol. 56, no 16, Oct. 19, 1921, pp. 378-379. [illegible] the unemployment emergency, and discusses steps for reviving construction. Memorandum submitted to President's Unemployment Conference.

UNIVERSAL JOINTS

[illegible] Pressed Steel Housing for a Universal Joint [illegible] 17, 1921, pp. [illegible], 8 figs. Method of producing small automobile parts. Series of stamping operations. Des[illegible]

URANIUM STEEL

MICROSTRUCTURE. Uranium Steels, Hugh S. Foote, Chem. & Met. Eng., vol. 25, no. 17, Oct. 26, 1921, pp. 789-792, 13 figs. Discussion of microstructure of [illegible] percentages of uranium. Brief description of influence of uranium as an alloy in structural and high-speed steels.

V

VENTILATION

INDUSTRIAL. Industrial Ventilation, R. L. Gould and E. L. Hewitt. Am. Mach. vol. 55, no. 20, Nov. 17, 1921, pp. 792-795, 3 figs. Relation of ventilation to efficiency. Various methods of natural and artificial ventilation.

VENTURI METERS

HERSHEL. The Hershel Venturi Meter (Il Venturimetro Herschel). Giornale del Genio Civile, vol. 59, July 31, 1921, pp. 439-448, 2 figs. Discusses its principle experimental verifications and practical application.

W

WAGES

LIMITATION OF OUTPUT. Limitation of Output, H. M. Vernon. Eng. & Indus. Management, vol. 6, no. 16, Oct. 20 1921, pp. 428-432, 3 figs. Based on chapter in writer's recently published book on industrial Fatigue and Efficiency. Includes statistical information obtained during war and now published for first time. Discussion as to what is best form of wage and piece-rate payment.

PROBLEMS. Wages Problems. Iron & Coal Trades Rev., vol. 103, no. 2794, Sept. 16, 1921, pp. 395-397. Paper by W. L. Hichens on "The Principles by which Wages are Determined" and paper by Prof. Kirkaldy on "The Wages System and Possible Developments." See also Colliery Guardian, vol. 122, no. 3168, Sept. 16, 1921, pp. 797-798 and p. 805.

SYSTEMS. A Wage System. Eng. & Indus. Management, vol. 6, no. 17, Oct. 27, 1921, pp. 468-469. Describes system in use in large American works which, it is claimed, contains many points of suggestive value meriting wider adoption and application.

WASTE HEAT

INSTALLATION AT CEMENT PLANT. Waste Heat Installation at Cement Plant Rock Products, vol. 24, no. 23, Nov. 5, 1921, pp. 13-17, 14 figs. Trinity Portland Cement Co., Dallas, Texas, erects waste-heat power plant at cost of over half a million dollars. Entire plant run by waste heat from kilns.

UTILIZATION. Waste Heat Utilization for Steam Generation, G. R. McDermott. Blast Furnace & Steel Plant, vol. 9, no. 10, Oct. 1921, pp. 607-613. Discusses sources of waste heat and waste-heat boilers of several types. (Abstract.) Paper read at Assn. of Iron & Steel Elec. Engrs. Convention.

WATER POWER

DEVELOPMENT IN WEST. Future Water Power Development Problems of the West, F. G. Baum. Jl. Electricity & Western Industry, vol. 47, no. 6, Sept. 15, 1921, pp. 221-223, 6 figs. Analysis of Western power resources and some new angles on the possibilities of 220,000-volt transmission.

WATER PIPES

STRESSES IN LARGE HORIZONTAL. Stress Coefficients for Large Horizontal Pipes, James M. Paris. Eng. News-Rec., vol. 87, no. 19, Nov. 10, 1921, pp. 768-771, 20 figs. Various elementary kinds of loading separately considered and adaptable by proper combination to actual loadings under any condition of support and surcharge.

WATER SUPPLY

AMERICAN STANDARDS. American Standards for Quality of Water, J. J. Hinman Jr. Jl. Soc. Chem. Industry, vol. 40, no. 17, Sept. 15, 1921, pp. 325R-327R. Discusses American Standards of water supply and gives tables of standards of state water laboratories and of plant operation.

WATER WORKS

SAND AND ICE IN INTAKES. Study of Sand and Ice Conditions at Water Intake. C. M. Daily. Eng. & Contracting, vol. 56, no. 19, Nov. 9, 1921, p. 435, 3 figs. Report of investigation on experimental intake tower and channel to determine action of ice and sand.

WINNIPEG, CAN. The New Winnipeg Waterworks, Frank W. Skinner. Engineering vol. 112, nos. 2913 and 2914, Oct. 28 and Nov. 4, 1921, pp. 589-591 and 621-624, 18 figs. Notes on design and location, type of aqueduct, intake, arch design, surge tank, culverts, construction railroads, drainage, concreting pipe manufacture and casting, etc.

WELDING

HAMMER. Hammer-Welding Plant of the Blaw-Knox Co., Ernest Edgar Thum. Chem. & Met. Eng., vol. 25, no. 16, Oct. 19, 1921, pp. 747-751, 8 figs. New plant and process for making large seamless tanks and sheet-steel vessels described by tracing course of an 8-ft. boiler shell of ⅝-in. plate through its manufacture.

See Electric Welding, Arc.

WELDS

TESTING. A Standard for Testing Welds. Ry. Jl., vol. 27, no. 10, Oct. 1921, pp. 14-19, 14 figs. Report of committee appointed by Am. Welding Soc. Discusses shop, commercial and research standards of tests, test specimens and machines.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

A

ACCOUNTING

POWER PLANTS. Power-Plant Accounts, Wilfred A. Miller. Power, vol. 54, nos. 16, 17, 18, 19, 20, 21, 22, 23, 24 and 25, Oct. 18, 25, Nov. 1, 8, 15, 22, 29, Dec. 6, 13 and 20, 1921, pp. 596-599, 636-638, 680-684, 719-723, 769-772, 805-809, 848-852, 891-894, 934-936 and 979-980, 59 figs. Oct. 18. How to record indirect expenses. Oct. 25: Interest on borrowed money, profit and related subjects, Nov. 1: Considerations in buying equipment; meaning of depreciation. Nov. 8: Power plant as manufacturing department. Nov. 15: "Income" and "profit and loss" accounts. Nov. 22: The "surplus" account. Nov. 29: Debit and credit the cost account. Dec. 6: Closing ledger accounts. Dec. 13: Investment account and reserve for depreciation and obsolescence. Dec. 25: Scrapping equipment. (Continuation of serial.)

AIR COMPRESSORS

REGULATION. The Regulation of Air Compressors, Power, vol. 54, no. 24, Dec. 13, 1921, pp. 918-921, 11 figs. Discusses various arrangements used to control amount of air delivered by compressor.

AIR CONDITIONING

CHEMICAL PROCESSES. Notes on the Relation of Atmospheric Conditions to Chemical Processes, A. E. Stacey. Jl. Am. Soc. Heating & Ventilating Engrs., vol. 27, no. 8, Nov. 1921, pp. 777-781, 3 figs. Gives a few typical examples of need of air conditioning in chemical industry.

AIRPLANE ENGINES

CARBURATORS. *See Carburators.*

CYLINDERS. Preliminary Calculation of Cylinder Dimensions for Aircraft Engines, Otto Schwager. Aerial Age Weekly, vol. 14, no. 8, Oct. 31, 1921, pp. 179-180 and 187. Method described depends on air requirement of fuel. Gives examples for water-cooled, air-cooled and rotary engines. Translated from Zeit. fur F. & M., Dec. 31, 1920.

FUEL. The Problem of Fuel for Aviation Engines, Aerial Age Weekly, vol. 14, no. 1, Sept. 12, 1921, pp. 8-11 and 22-23, 6 figs. Technical note of Nat. Advisory Committee for Aeronautics. Discusses composition, quantity available, price per heat unit, stocks of fuel at aerial ports, preparation of fuel mixtures, carburetor function, etc. Lecture given by Prof. Kutzbach.

GEAR PUMP. Performance of a Vane-Driven Gear Pump. R. H. Heald. Aerial Age, vol. 14, no. 4, Oct. 3, 1921, pp. 81-83 and 90, 8 figs. Gives results of tests with pumping unit driven by a wind wheel in air stream during flight, for pumping gasoline to tank in upper wing from which it flows by gravity.

RADIATORS. Cooling System Test of the Curtiss JN-6 with Packard 1A-744 Engine Equipped with Side Radiators. Air Service Information Circular, vol. 3, no. 294, Oct. 20, 1921, 12 pp. 8 figs. Result of test to determine effectiveness of side radiators.

AIRPLANES

IMPROVING PERFORMANCE. Means for Improving Airplane Performance, Harlan D. Fowler. Aviation, vol. 11, no. 23, Dec. 5, 1921, pp. 652-655, 14 figs. Discusses aerofoils, combining high speed with large load, variable area, etc.

LOAD FACTORS. Effect of Variation in Load Factor on Structural Weight of Wings, R. A. Miller. Aerial Age Weekly, vol. 14, no. 8, Oct. 31, 1921, pp. 177-178, 1 fig. Concludes that area of spars varies directly with load factor, area of struts varies with load factor and increases at slightly smaller rate than load factor, etc

MULTI-ENGINED. Multi-Engined Commercial Airplanes, Donald W. McIlhiney. Aviation, vol. 11, no. 18, Oct. 31, 1921, pp. 506-507. Gives table of principal data of 44 such airplanes, and discusses main points.

SPEED METERS. N.A.C.A. Recording Air Speed Meter, F. H. Norton. Aerial Age Weekly, vol. 14, no. 7, Oct. 24, 1921, pp. 151 and 154, 7 figs. Describes new type designed by technical staff of Nat. Advisory Committee for Aeronautics, consisting of a tight metal diaphragm of high natural period which is acted upon by the pressure difference of a pilot-static head.

STAGGERING OF BIPLANE. The Effects of Staggering a Biplane, F. H. Norton. Aerial Age Weekly, vol. 14, no. 5, Oct. 10, 1921, pp. 103-104, 5 figs. The lift, drag and center of pressure travel are determined for a biplane with a stagger varying from—100 per cent to + 100 per cent.

STATIC TEST. Report of Static Test on Engineering Division Messenger Airplane. Air Service Information Circular, vol. 3, no. 270, Oct. 1, 1921, 15 pp. 10 figs. Particulars of tests carried out at McCook Field, Dayton, Ohio, to determine strength of wings, ailerons, empennage, fuselage, and chassis.

STORAGE OF PARTS. Instructions for the Storage of Airplanes Engines, Their Parts and Accessories. Air Service Information Circular, vol. 3, no. 256, July 15, 1921, 9 pp. Deals with storage of wooden airplane parts, airplane materials, engines, armament, equipment and propellers. Specifications covering requirements of Air Service for rust-preventing compound for protection against corrosion of aircraft engine.

STRUTS. Tests on Combined Loading of Wooden Struts. Air Service Information Circular, vol. 3, no. 276, Oct. 1, 1921, 11 pp. 5 figs. Results of investigation to determine whether test data obtained when a wooden strut is subjected to a column load and also to a side or lateral bending load verify formulas now in use.

TESTS. Aerodynamical Report and Tests on the Eggleston Air-Cell Giant Biplane. Aerial Age Weekly, vol. 14, no. 14, Dec. 12, 1921, pp. 323-324 and 326, 4 figs. Report of tests carried out at wind speed of 30 m.p.h. by Cox-Klemin Aircraft Corp., College Point, L. I.

TRUSS RIBS. Experimental Reinforced Plywood Truss Ribs, B. C. Boulton. Aerial Age Weekly, vol. 13, no. 25, Aug. 29, 1921, pp. 591-594, 17 figs. Gives tables of data for rib design and direct stresses in rib trusses. Test data on 15 ft. truss ribs. (Concluded).

See also Flying Boats; Seaplanes.

AIRSHIPS

MOORING. The Mooring of Airships, G. H. Scott, Flight, vol. 13, no. 48, Dec. 1, 1921, pp. 803-04. Discusses mooring on surface of land or water; mooring in the air on one or more wires, and towing; and mooring at a mast. Extract of paper read before Cambridge Univ. Aeronautical Soc.

NON-RIGID, STRESSES IN. Bending Moments, Envelope, and Cable Stresses in Non-Rigid Airships, C. P. Burgess. Nat. Advisory Committee for Aeronautics report no. 115, 1921, 14 pp., 4 figs. Describes theory of calculations and methods in use in U.S. Navy Bur. of Aeronautics. Principal stresses are said to be due to gas pressure and unequal distribution of weight and buoyancy, and concentrated loads from car suspension cables. Deals also with variations of tensions in car suspension cables of any type of airship, with reference to rigid type, due to propeller thrust or inclination of airship longitudinally.

ALLOY STEELS

Cracking During Dip Brazing. Report on Cause of Cracking of Alloy Steel During Dip Brazing. Air Service Information Circular, vol. 3, no 295, Oct. 20, 1921, 3 pp 2 figs. Results of investigation show that two influences contribute to cracking, namely, a sudden rise in temperature after immersion in brass, a sharp [illegible] cross-section [illegible] in specimen. Slow preheating to brazing temperature is said to obviate this difficulty

Impact Tests. Effect of Repeated Impact on Steels. (Influence des chocs repétés à la compression sur les aciers), Fernand Eloy. Revue de l'Industrie Minérale, no. 19, Oct 1, 1921, pp 603-606. Discusses tests with special and carbon steels, showing superiority of former.

Tool Steel. Tool-Steel Specifications—A Hard Nut to Crack, Charles M. Brown. Raw Material, vol. 4, no. 10, Oct. 1921, pp. 349-352. Advocates formulation of definite standards as an advantage from user's point of view.

ALLOYS

Carbon-Chromium-Silicon. A New Carbon-Chromium-Silicon Resistance Material. Raw Material, vol. 4, no. 10, Oct. 1921, pp. 359-361, 4 figs. Discusses physical properties of "Silchrome" and gives results of tests made at Columbia University for electric resistance, etc.

See also Aluminum Aloys; Bearing Metals; Magnesium Alloys.

ALUMINUM

Industrial Applications. New Industrial Application of Aluminum, Magnesium, Calcium and Sodium. (Conférences et exposition publiques des nouvelles applications industrielles de l'aluminium du magnésium, du calcium et du sodium). Bul. de la Société d'Encouragement pour l'Industrie Nationale. vol. 133, no. 7, July-August-September, 1921, pp. 683-956, 186 figs., partly on supp. plates. Papers read at recent Aluminum Exposition, discussing manufacture, properties, alloys, castings, use in electric and food industries, welding, enameling, etc. See also Revue de Métallurgie, vol. 18, no. 9, Sept. 1921, pp. 541-607, 43 figs.

ALUMINUM ALLOYS

Bronzes. On the Heat-Treatment of Aluminum Bronze, A. A. Blue. Chem. & Met. Eng., vol. 25, no. 23, Dec. 7, 1921, pp. 1043-1048, 25 figs. Concludes from experiments that heat treatment produces marked and consistent changes in Brinell and scleroscope hardness and has little or no effect on tensile strength and yield point.

Researches. Researches on Aluminum Alloys, Walter Rosenhain, Sydney L. Archbutt and D. Hanson. Engineering vol. 112, nos. 2913 and 2914, Oct. 28 and Nov. 4, 1921, pp 614-615 and 644-645, also Engineer, vol 132, nos. 3436, Oct. 28, and Nov. 4, 1921, pp. 461-463 and 489-490. Brief account of principal contents of report to Alloys Research Committee. Deals with east and wrought alloys; permanence and constitution of alloys.

AMMONIA

Synthesis. The Procedure of the Synthesis of Ammonia, Carl Bosch. Chem. Age (N.Y.), vol. 29, no. 11, Nov. 1921, pp. 451-458, 5 figs. Process and apparatus for synthetic production of ammonia from nitrogen and hydrogen.

APPRENTICES, TRAINING OF

Shipyards. American Shipyard Apprenticeships, Evening Schools and Scholarships, Charles F. Bailey. Advance Copy, Soc. of Naval Architects & Mar. Engrs., meeting Nov. 17-18, 1921, no. 8, 10 pp., 1 fig. Reviews present situation, including requirements for apprenticeship. pay, bonus, evening schools, scholarships, etc., and makes suggestions for improvement.

AQUEDUCTS

Montreal, Can. History of the Montreal Aqueduct, A E. Doucet. Jl. Eng. Inst. Can., vol. 4, no. 12, Dec. 1921, pp. 601-605. Early methods of supply. Description of original aqueduct and first and second enlargements.

ARMATURES

Locating Faults in D.C. Locating Faults in Direct-Current Armatures — Effects of Grounds, B. A. Briggs. Power, vol. 54, no. 24, Dec. 13, 1921, pp. 927-929, 6 figs Discusses various conditions under which grounds may occur in an armature. Causes of insulation failure to ground. Testing for grounded coils with a lamp and how to cut these coils out of circuit.

AUTOMOBILE ENGINES

Anti-Freezing Solutions. Anti-Freezing Solutions, O. B. Zimmerman. Jl. Soc. Automotive Engrs., vol. 9, no. 5, Nov. 1921, pp. 307-310 and (discussion) 310-312. Progress report of Committee of S.A.E., discussing cooling media and their ideal requirements.

[illegible] Camshafts. Machinery (Lond.), vol. 19, no. 477, Nov. 17, 1921, pp. 189-194, 9 figs. Description of important oper[illegible] manufacturing procedure in making camshafts for a high-grade motor-car.

[illegible]

[illegible] J. William Chubb. Am. Mach., vol. 55, no 21 Nov. 24, 1921, pp. 827-830, 10 figs. Methods used in well-equipped English motor plant. Cylinders produced on American [illegible]

AUTOMOBILE FUELS

Air-Fuel Mixtures. Condensation Temperatures of Gasoline and Kerosene-Air Mixtures, Robert E. Wilson, and Daniel P. Barnard. Jl. Soc. Automotive Engrs., vol. 9, no. 5, Nov. 1921, pp. 313-319, 11 figs. Describes simple and reliable method for determining temperatures of initial condensation of fuels from air-fuel mixtures, and an approximate method of determining temperatures of partial condensation in such mixtures. From paper read before Am. Chem. Soc.

Benzol. *See Benzol.*

AUTOMOBILES

Brakes, Four-Wheel. The History of Four-Wheel Brakes. Autocar, vol. 47, no. 1361, Nov. 19, 1921, pp. 1057-1064, 21 figs. A series of articles on brakes, including, operating front wheel brakes, Servo brakes, and four-wheel brake tests.

Design. Car Design and Production. Autocar, vol. 47, no. 1362 Nove, 26, 1921, pp. 1123-1126, 7 figs. Shows how design, workshop processs and material costs influence selling price of a motor vehicle.

Frame Stresses. Automobile Frame Stresses, Ethelbert Favary. Jl. Soc. Automotive Engrs., vol. 9, no. 5, Nov. 1921, pp. 301-303 and (discussion) 303-306, 3 figs. Gives frame-stress calculations intended to enable the designer to proportion frames and parts with the view of eliminating some of the factors that are productive of excessive weight which causes fuel wastage. Laboratory tests of tensile strength, elastic limit, yield point, etc., of materials.

German 1921 Show. The German Automobile Exhibition 1921, A. Heller. Eng. Progress, vol 2, no. 11, Nov. 1921, pp. 241-246, 9 figs. Discusses motors, carburetors, radiators, electric equipment, head lights, speed change gear, back-axle drive, road wheels and springs.

Machining Differential Gear Case. Mtehods and Tools Used in Machining the Peerless Differential Carrier and Gear Case, Fred H. Colvin. Am. Mach., vol. 55, no. 23, Dec. 8, 1921, pp. 912-914, 11 figs. Turret lathe tooling for special jobs; drilling fixture for rapid handling of work; gages for surfaces which are not easy of access.

Mechanical Features. Progress in Design. Autocar, vol. 47, no. 1360, Nov. 12, 1921, pp. 945-953, 21 figs. Notes on engine design, gas passages, valves, lubrication, carburation, transmission, brakes, steering suspension, and wheels.

Repair Service. Automotive Service Methods and Equipment, Howard Campbell. Am. Mach., vol. 55, no. 22, Dec. 1, 1921, pp. 870-873, 7 figs. Details of service plant of Hellman Motor Corp., Long Island City, N.Y.

AVIATION

Commerciale. Commercial Aviation in France. (L'Aviation Commerciale Française), L. Hirschauer. La Technique Moderne, vol. 13, no. 4, April 1921, pp 145-153, 12 figs. Gives tabulation of lines in existence; shows development of aerial transport companies. their flying machines and government action; reviews activity in other countries.

B

BALANCING

Reciprocating Masses. The Exponential Method in the Analysis of the Balance of Reciprocating Masses, P. Cormack. Engineering, vol. 112, no. 2919, Dec. 9, 1921, pp. 778-780, 1 fig. Calculation of inertia forces for radial and rotating cylinder engines.

Rotating Parts. Balancing Rotating Parts. (Sur l'équilibrage des pièces en rotation). P. Lemaire. La Technique Moderne, vol. 13, no. 6, June 1921, pp. 249-257, 27 figs. Discusses static and dynamic balancing of machinery.

BEAMS

Irregularly Distributed Loads. Beams with Loads irregularly Distributed, T. Thompson. Engineering, vol. 112, nos. 2915 and 2916, Nov. 11 and 18, 1921, pp. 656-658 and 686-689, 7 figs. Describes method for speedy and accurate calculation of bending moments and deflections of beam with irregularly distributed loading.

BEARING METALS

Babbitt. Characteristics of Bearing Metals, Edward T. Keenan. Power, vol. 54, no. 25, Dec. 20, 1921, pp. 977-978. Composition of various babbitt metals for various kinds of bearings. List of babbitts and their compounds.

Industrial Value. Bearing Metals and Their Industrial Value, J. Czochralski. Brass World, vol. 17, nos. 9 and 10, Sept. and Oct, 1921, pp. 245-248 and 281-286, 33 figs. Sept: Discusses alloys in which tin is replaced by lead, and experiments carried out for the purpose. Oct: Methods of testing and comparative efficiency of bearing metals. Abstract). Zeit. F. Metallkunde.

BEARINGS

Hand vs. Machine-Finished. Hand Versus Machine Finished Bearings, E. A. Dixie. Am. Mach., vol. 55, no. 22, Dec. 1, 1921, pp. 888-890. Comparison of machine and hand-finished surfaces. Some examples of better and quicker work.

BEARINGS, BALL

Friction and Safe Load. Friction and Carrying Capacity of Ball and Roller Bearings, H. L. Whittemore and S. N. Petrenko. U.S. Bur. Standards Technologic Papers, no. 201, Oct. 6, 1921, 34 pp., 30 figs. Account of experiments undertaken to deternine maximum safe load and static friction under load of ball and flexible roller bearings. Results agree roughly with Herts's theory, differences being ascribable to inhomogeneity of material.

GRINDERS. Use of Ball Bearings as Adapted to Grinders, Donald A. Hampson. Can. Machy., vol. 26, no. 17, Oct. 27, 1921, pp. 30-32 and 36, 9 figs. Discusses advantages as to lower cost of production, increased output, higher efficiency, saving of power, etc.

BEARINGS, ROLLER

CALCULATION. Practical Calculations of Roller Bearings (Calcul pratique des roulements à rouleaux), P. Masson. La Technique Moderne, vol. 13, no. 5, May 1921, pp. 193-197, 3 figs. Discusses cylindrical and conical roller bearings and works out formulas. Comparison with ball bearings.

TYPES. Usual Forms of Roller Bearings (Les formes usuelles des roulements à rouleaux). La Technique Moderne, vol. 13, no. 6, June 1921, pp. 258-263, 22 figs. Describes products of various American, British, French and Swedish firms.

BLAST-FURNACE GAS

BURNING UNDER BOILERS. Burning Blast-Furnace Gas Under Boilers, Gordon Fox and F. H. Wilcox. Power, vol. 54, no. 24, Dec. 13, 1921, pp. 930-931. Discusses gas burner, ignition, combustion chamber, baffling, and draft losses through boiler passes.

BLIND

MPLOYMENT OF. The Employment of the Blind in Workshops. Engineering, vol. 112, no. 2917, Nov. 25, 1921, pp. 715-717, 7 figs. Deals with experience gained in Germany in employment of blind on machine work, and machining operations performed by blind at the Siemens-Schuckert Works.

BLUEPRINTING

IGH-SPEED MACHINE. A High-Speed Blue Printing Machine. Engineer, vol. 132,, no. 3438, Nov. 18, 1921, p 345, 5 figs. Describes new photo-printing machine brought out by B. J. Hall & Co., Ltd., London.

BOAT LIFTS

0-FT. LIFT. Elevators for Raising Boats to Considerable Heights (Elevators di navi per grandi altezze de sollevamento). L'Industria, vol 35, no. 17, Sept. 15, 1921, pp 391-394, 5 figs. Describes installation designed by four German companies for raising boats 36 meters, which works successfully.

BOILER FEEDWATER

TREATMENT. Boiler Feed Water Treatment and Treatment Control, E. C. Bashore. Power Plant Eng., vol. 25, no. 21, Nov. 1, 1921, pp. 1050-1052. Causes of scale, corrosion, foaming, embrittlement, and methods of treatment. (abstract). Paper read at Nat. Exposition of Chem. Industries.

The interior Treatment of Boiler Waters, C. R. Knowles. Ry. Age, vol. 71, no. 20. Nov. 12, 1921, pp. 935-936. Discusses introduction of substances into boiler to prevent scale, corrosion, foaming or other ill effects of bad water.

The Treatment of Boiler Feed Water, Robert June, Power House, vol. 14, no. 21, Nov. 5, 1921, pp. 21-23, 3 figs. Discusses artificial zeolite systems and evaporating methods.

BOILER OPERATION

L CONSUMPTION, CONTROL OF. The Influence of Weather on Coal Consumption, Malcolm C. W. Tomlinson. Management Eng., vol. 1, no. 6, Dec. 1921, pp. 321-326, 13 figs. Describes method of using outside temperature to check boiler operation.

BOILER PLANTS

ONOMICAL DESIGN. Boiler and Furnace Economy, D. S. Jacobus. Mech. Eng., vol. 43, no. 12, Dec. 1921, pp. 779-782. Deals with such questions as when it will pay to use economizers in a new plant; most economical rating at which to operate a boiler; limitations imposed on efficiency by inability of furnace brickwork to withstand temperatures available with many classes of fuel; furnace volume and length of flame travel; use of air heaters, etc.

Boiler-House Management, David Brownlie, Iron & Coal Trades Rev., vol., 103, nos. 2803 and 2804, Nov. 18 and 25, 1921, pp. 721-722 and 700-702. Nov. 18: Discusses efficient design and equipment of boiler plant and scientific control of the working of the plant. Types of boilers and relatives advantages and disadvantages. Nov. 25: Discusses mechanical stoking, economizers and feedwater heaters, superheaters, forced or induced draft, and auxiliary machinery. (Abstract). Paper read before South Wales Inst. Engrs.

BOILERS

EHEATING WITH FLUE GAS. Utilizing Flue Gases to Preheat Air to Furnace—Consideration of Some of the Problems Involved, E. R. Welles and C. T. Mitchell. Power, vol. 54, no. 22, Nov. 29, 1921, pp. 844-846, 1 fig. Points out that rough calculations (the best that can be made with available data) indicate reasonable possibility of economic application of preheating.

WATER WORKS. Selecting Steam Boilers for Water Works, F. W. Dean. Fire & Water Eng., vol. 70, nos. 22 and 23, Nov. 30 and Dec. 7, 1921, pp. 1007-1008, 1014 and 1027-1029 and 1053-1054 and 1058. Importance of choosing most economical type. Various kinds of boilers with their characteristics considered. Proper setting and fuel to be used. Boiler safety. (Abstract). Paper read before N. E. Water Works Assn.

BRAKES

MBINATION AIR AND VACUUM. Brakes on the Paulista Railroad (Frenos para el Ferrocarril Paulista), F. H. Parke. Ingenieria Intercolonial, vol. 6, no. 6, Dec. 1921, pp. 348-351, 3 figs. A combination of air and vacuum brake for electric locomotives drawing trains provided with air brakes, constructed by Westinghouse Air Brake Co.

WESTINGHOUSE DOUBLE-CAPACITY. Exceptional Train Loading in the United States and the Westinghouse Double Capacity Brake. Ry Gaz., vol. 35, no. 21, Nov. 18, 1921, pp. 769-771, 5 figs. Tests with 75,100 and 110-car coal trains, respectively 12,000, 16,000 and 17,250 American tons, on Virginian railway, fitted with Westinghouse empty and load brake.

BRASS

HEAT TREATMENT. Heat Treatment of Brass and Brasses Containing Tin, Léon Guillet. Chem. & Met. Eng., vol. 25, no. 22, Nov 30, 1921, pp 1009-1014, 16 figs. Brasses containing a little beta respend to heat treatment; tin-brasses, developing special constituent analogous to delta in bronzes, may have their physical properties changed very notably by proper annealing and quenching. From Revue de Métallurgie, July 1921.

HOT-WORKING. Hot Working of Brass (Le travail du laiton à chaud), A. Devilliers. La Technique Moderne, vol 13, no 5, May 1921, pp 206-209, 8 figs. Discusses [illegible] content of lead, effect of aluminum and pros and cons of hot and cold working.

BRIDGE DESIGN

LONG SPAN. Some Thoughts on Long-Span Bridge Design, Gustav Lindenthal. Eng., News-Rec., vol 87, no. 21, Nov. 24, 1921, pp. 861-864. Notes on architectural features; aesthetics and East River bridges; wire-cable problems and eyebar chain possibilities.

BRIDGES, RAILWAY

STRESS CALCULATION. The Influence of Rigid Connections on the Distribution of Live Loads on Raileay Underbridges, Conrad Gribble. Ry. Engr, vol. 42, no. 502, Nov. 1921, pp. 413-417,12 figs. Shows that not only bending moments but shears and reactions are different from those which would be deduced from the assumption of free ends.

C

CALORIMETERS

RECORDING. Report on Recording Calorimeters, Gas World, vol. 75, no. 1943, Oct. 15, 1921, pp. 314-319 and (discussion) 319-321, 5 figs. Fifth report of Research Sub-Committee of Gas Investigation Committee giving results of tests made.

CARBURETORS

AIRCRAFT. Instructions to Designers of Aircraft Carburetors. Air Service Information Circular, vol 3, no. 291, Oct. 20, 1921, 4 pp. 2 figs. Deals with general requirements of carburetor design, gasoline inlet connection, gasoline strainer, float chamber, metering jets, air intake pipe, venturis, throttles, mixture control. performance, tests inspection, etc.

KEROSENE CARBURETION. Actual State of Kerosene Carburetion (Etat actuel de la carburation au pétrole lampant), Sigma. La Métallurgie, vol. 53, no. 45, Nov. 10, 1921, pp. 2101-2102. Discusses mixing, ignition, combustion, flame control, etc. (Concluded)

METERING CHARACTERISTICS. Report on the Control of Carburetor Metering Characteristics by the Supplementary Admission of Air. Air Service Information Circular, vol. 3, no. 292, Oct 20, 1921, 14 pp., 9 figs. Results of test to determine characteristics of mixture-control device operating on principle of supplementary admission of air, particularly as applied to high-compression, over-dimensioned aviation engine, under laboratory and flight conflictions.

TESTING ZENITH. Testing a Zenith Carburetor (Essai d'un carburateur Zénith à triple diffuseur sur voiture 16 hp. Panhard S.S.), Henri Petit. La Vie Automobile, vol. 17, no. 739, Oct. 10, 1921, pp. 374-375, 2 figs. Details of three tests on a 16-hp. Panhard.

CARS

ELECTRIC. Illinois Central Steel Suburban Coaches. Ry. Mech. Engr., vol. 95, no. 12, Dec. 1921, pp. 755-759, 11 figs. Designed for future electrification; doors electrically controlled; total weight 92,100 lbs.

CARS, COAL

STEEL HOPPER. All-Steel Coal Hopper Wagons for Bengal-Nagpur Railway. Ry. Engr., vol. 42, no. 502, Nov. 1921, pp. 405-409, 5 figs. High-capacity hopper wagons constructed by Midland Railway Carriage & Wagon Co., Ltd., Birmingham, for Bengal-Nagpur Railway, to the design of J. W. Barry.

CARS, FREIGHT

BOX. The Use of Ordinary Box Cars for Shipping Fruit, Vane G. Gibson and Herbert Graff. Ry. Rev., vol. 69, no. 20, Nov. 12, 1921, pp. 643-646, 7 figs. Tests undertaken by Department of Agriculture show most practical means for ventilating box cars. (Abstract).

CONTAINER. Avoidable Waste in Car Operation—The Container Car, Walter C. Sanders. Mech. Eng., vol. 43, no. 12, Dec. 1921, pp. 799-802, 9 figs. Describes "container" cars recently placed in service on N.Y. Central lines and others having improvements on original type which are now under construction. Advantages of described car are enumerated.

WOOD IN CONSTRUCTION OF. The Use of Wood in Freight Car Construction, H. S. Sackett. Ry. Age, vol. 71, no. 22, Nov. 26, 1921, pp. 1037-1042, 6 figs. Relative advantages of double and single sheathed box car; composite gondola car; advantages of composite design; etc. Gives table of lumber grades and dimensions.

CARS, PASSENGER

ALL-STEEL. Illinois Central Suburban Operation and Equipment. Ry. Rev., vol. 69, no. 21, Nov. 19, 1921, pp. 669-677, 14 figs. Describes new all-steel cars just put in service as first step toward electrification.

New All-Steel Suburban Coaches for the South African Railways. Ry. Gaz., vol. 35, no. 20, Nov. 11, 1921, pp. 722-725, 6 figs. Describes all-steel composite bogie coaches built by Leeds Forge Co., Ltd., constructed on central gangway principle.

DESIGN. On the Question of Passenger Carriages, W. J. Tollerton. Bul. Int. Ry. Assn., vol. 3, no 10, Oct. 1921, pp 1399-1440, 52 figs. Gives list of questions and answers regarding general types and arrangements of passenger carriages used in U. S., Canada and Mexico, details of construction of principal parts of carriage, lighting, heating, ventilating, etc.

CARS, TANK

MILK. Handling Milk in Specially Constructed Tank Cars. Ry. Mech. Engr., vol. 95, no. 12, Dec. 1921, pp. 763-764, 3 figs. Large glass-lined steel tanks save expense in handling and haulage; refrigeration in transit eliminated.

CAST IRON

SELF-CORROSION. Self-Corrosion of Cast Iron and Other Metals in Alkaline Soils, W. Nelson Smith and J. W. Shipley. Elec. Ry. Jl., vol. 58, no. 21, Nov. 19, 1921, pp. 911-912. Results of investigation to show that city water main external corrosion could not be due to electrolysis from stray currents. (Abstract). Paper read before Eng. Inst. of Can.

CENTRAL STATIONS

AUXILIARY DRIVES. Relation of Auxiliary Drives to Heat Balance, J. R. McDermet. Power, vol. 54, no. 23, Dec. 6, 1921, pp. 888-890, 1 fig. Deals with direct steam drive, motor drive, house turbines, combination drives, and feedwater heating by bleeder condensers.

SUPERPOWER. A Superpower System for the Region Between Boston and Washington, W. S. Murray. U. S. Geol. Surv' professional paper 123, 1921, 261 pp., 61 figs. and 11 supp. plates. Market for superpower energy will be furnished by electric utilities, industries, and railroads. Estimated requirement for energy supplied through electric utilities for municipal, private, industrial, and railroad purposes in 1930 is 31,000,000,000 kw-hr., which could be supplied by co-ordinated power system such as is described. Study of 96,000 manufacturing establishments operating within superpower zone shows that by 1930, they can save $190,000,000 annually above fixed annual charge sagainst capital investment of $185,000,000. See a so Power Plant Eng. vol. 25, no. 24, Dec. 15, 1921, pp. 1185-1187, 1 fig.

CHARTS

SCALE SELECTION. Scale Selection for Z Charts, Arthur R. Burnet. Management Eng., vol. 1, no. 6, Dec. 1921, pp. 365-370, 4 figs. Describes new method of chart making and curve plotting and compares it with older method.

CHIMNEYS

TALL, DESIGN OF. Notes on the Design of Tall Chimneys and Their Foundations, J. M. Wade. Roy. Engrs. Jl., vol. 34, no. 5, Nov. 1921, pp 209-219, 6 figs. Discusses design, height, draft, and calculations, including calculations of gases formed by combustion of one ton of coal, and for height and outlet of a chimney for furnaces consuming two tons of fuel per hour.

CHROME STEEL

AUTOMOBILE INDUSTRY. Chromium Steels and Irons Leslie Aitchison. Iron & Coal Trades Rev., vol 103, no. 2802, Nov. 11, 1921, pp. 686-687 Discusses alloy and carbon steels, effect of alloying on critical temperature, mechanical properties, stainless steels, and vanadium additions, especially in connection with the automobile industry.

MECHANICAL PROPERTIES. Chromium Steels and Iron, Leslie Aitchison. Engineering, vol. 112, nos. 2918 and 2919 Dec. 2 and 9, 1921, pp. 771-772 and 805-807, 5 figs. Brief account of general effect which chromium exerts upon steels, followed by description of mechanical properties of chrome steels. Paper read before Instn. Automobile Engrs.

COAL

BRIQUETTING. Duplex Coal-Briquetting Machine. Engineering, vol 112, no. 2916, Nov. 18, 1921, pp. 689-691, 12 figs. Describes machines constructed by Sutcliffe, Speakman & Co., Ltd., Leigh, England, weighing 32 tons and exerting pressure of 200 tons on material. At speed of 30 working strokes per min. machine turns out 40 tons of briquettes per hr. with expenditure of 48 hp.

COKE OVENS

SILICA BRICK FOR. Silica Brick For Coke Ovens, A. H. Middleton. Colliery Guardian, vol. 122, no. 3174, Oct. 28, 1921, pp. 1203-1204. Discusses advantages of silica over quartzite brick, including greater output and thermal efficiency, greater durability, resistance to corrosion, etc. Author would not advise use of brick with higher specific gravity than 2.35 for very high temperatures. Paper read before Coke Oven Managers' Assn. Report of discussion on above paper in Colliery Guardian, vol. 122, no. 3175, Nov. 4, 1921, [illegible] 1274

COLUMNS

BUCKLING UNDER AXIAL LOAD. Buckling of Elastic Structures, H. M. Westergaard. Proc. Am. Soc. Civ. Engrs. vol. 47, no. 9, Nov. 1921, pp. 455-533, 14 figs. Investigation deals with structural actions in which stresses are not proportional to loads, although proportional limit of material has not been exceeded and deflections remain small. Describes astatic and in particular, heterostatic action. Deals also with columns carrying axial and transverse loads at same time. Formulas are given for buckling of slabs and systems of crossing-beams. Classified bibigroaphy.

COMBUSTION

CONTROLLING RATE. Controlling the Rate of Combustion. Sanitary and Heating Eng., vol. 96, no. 11, Nov. 18, 1921, pp. 313-314, 2 figs. Discusses hydraulically operated damper regulators in low pressure heating plants.

COMPRESSED AIR

INTERCOOLING. Value of Intercooling Compressed Air, C. K. Bennet. Power Plant Eng., vol. 25, no. 23, Dec. 1, 1921, pp. 1142-1144, 5 figs. Methods and means of cooling air during and after compression.

CONCRETE

AGGREGATE, SAND IN COARSE. Permissible Tolerance of Sand in Coarse Aggregates W. K. Hatt. Pub. Roads, vol. 4, no. 6, Oct. 1921, pp. 19-21 and 26, 8 figs Results of investigation of 1:2:3. 1:2:4 and 1:3:6 concrete, using in each case both a fine and coarse sand as fine aggregate.

PROPORTIONING. Method of Proportioning Concrete Materials—Screened and Unscreened Gravel, R. W. Crum. Iowa State College of Agriculture & Mechanic Arts Official Publication, vol. 19, no. 51, May 18, 1921, bul. 60, 56 pp., 21 figs. Based on laboratory investigations carried out by P. J. Preston Describes laboratory tests made in verification of method.

CONCRETE CONSTRUCTION, REINFORCED

SEA WATER, IN OR NEAR. Use of Reinforced Concrete in or Near Sea Water. Eng & Contracting vol 56, no. 21, Nov. 23, 1921, pp. 487-488. Report submitted by Arthur S. Tuttle of Board of Estimates & Apportionment of New York City. Summary of rules for securing durable work.

CONCRETING

FREEZING WEATHER, IN. The Cooling of Fresh Concrete in Freezing Weather, Tokujiro Yoshida. Eng. & Contracting, vol 56, no. 21 Nov. 23, 1921, pp. 474-478, 7 figs. Data on length of time required for concrete of given temperature to lose its heat and become cold enough to freeze when exposed to temperatures lower than freezing point of water. (Abstract). Bulletin issued by Engineering Experiment Station of University of Ill.

CONDENSERS, STEAM

COOLING-WATER TREATMENT. Chemical Treatment of Water for Cooling Condensers (Du traitement chimique des eaux servant à la réfrigération des condenseurs), G. Paris. Chaleur et Industrie, vol. 2, no. 18, Oct. 1921, pp. 634-642, 12 figs. Describes Balke process which changes bicarbonate of lime and magnesium into chlorides by addition of hydrochloric acid, and the Hulsmeyer process depending on thermic action and addition of sodium carbonate.

CONVEYORS

MOLD. Conveyor System Cuts Moulding Costs, Herbert H. Leonard. Can. Manufacturer, vol. 41, no. 11, Nov. 1921, pp. 31-35, 11 figs. Moulding car wheels on jolt machines is made possible by adoption of conveyor systems for transferring molds, flasks and sand, supplemented by I-beam trolleys and gravity conveyors

NEW SYSTEM. Tramrail Reduces Labour Force to Half. Iron Age, vol. 108, no. 24, Dec. 15, 1921, pp. 1523-1525, 3 figs. States that marked reduction in production costs has been effected by Globe Machine & Stamping Co., Cleveland, by installation of new conveying system and japanning equipment.

COPPER METALLURGY

SULPHATE, MANUFACTURE OF. The Manufacture of Copper Sulphate, H. Suchanek. Chem. Trade Jl. & Chem. Engr., vol. 69, no. 1801, Nov. 26, 1921, pp. 652-655. Principal materials for preparation of copper sulphate are old copper, copper-containing residues, ashes, etc. cupreous pyrites, ores poor in copper, and impure sulphate solutions. Description of plant for use of scrap copper as raw material; and manufacture from other cupreous materials. Translated from Chemiker-Zeitung, Nov. 3, 1921.

COST ACCOUNTING

JOB CARDS. Job Cards, Hubert Bentley. Eng. & Indus. Management, vol. 6, no. 19, Nov. 10, 1921, pp. 533-534, 2 figs. Outlines useful method of keeping distinct record of time taken on jobs for costing purposes. Describes specimen job cards

COST SYSTEMS

FOUNDRY. Advantages of a Foundry Cost System, Robert E. Belt. Iron Age, vol. 108, no. 21, Nov. 24, 1921, pp. 1351-1353. Points out that it forms basis for establishing selling price and indicates degree of efficiency of various departments. Paper read before Nat. Founders' Assn.

CRANES

Metallurgical Industry. Modern Cranes and Conveyors in the Metallurgical Industry (Les appareils modernes de levage et de manutention dans l'industrie metallurgique), Lucien Dujardin. L'Outillage, vol. [illegible], no. 12, Oct. 20, 1921, pp. 1087-1103, 50 figs. A number of articles discussing construction and operation of apparatus for charging furnaces of various systems, electromagnets, crane trucks, etc.

Mounted on Trucks. The Truck with the Giant Arm. Commercial Vehicle, vol. 25, no. 8, Nov. 1921, pp. 30-31, 4 figs. Universal crane, mounted on different trucks, speeds up all types of loading and gives greater flexibility in maneuvring into position.

CRANKSHAFTS

Grinding. Crankshaft Grinding. Eng. Production, vol. 3, no. 58, Nov. 10, 1921, pp. 447-450, 11 figs. Notes on special machines and attachments.

CUTTING METALS

Acetylene Jet-Cutting Machines. Economy in Metal Cutting. Eng. & Indus. Management, vol. 6, no. 20, Nov. 17, 1921, pp. 565-566, 2 figs. Describes Godfrey acetylene jet-cutting machine and its economic advantages.

Oxy-Hydrogen Cutting. Effect of Oxy-Hydrogen Cutting on Locomotive Rods, Arthur F. Pitkin, Am. Mach., vol. 55, no. 24, Dec. 15, 1921, pp. 964-965, 11 figs. Unusual examples of rapid cutting together with data as to its effect on steel used in locomotive rods.

D

DAMS

Earth. Reclamation Service Building Highest Earth Dam, R. T. Crowe, Eng. News-Rec., vol. 87, no. 22, Dec. 1, 1921, pp. 890-891, 4 figs. Tieton dam to be 232 ft., high with concrete core wall 100 ft into rock. Unique method of building corewall. Reprinted from Reclamation Rec., Oct.

Multiple-Arch. Calculations of Multiple Arch Dams (Sul calcolo delle dighe ad archi multipli), Gregori Antonino. Giornale dell' Associazione Nazionale degli Ungegneri Italiani. vol. 2, no. 8, June 1, 1921, pp. 111-114, 2 figs. Deals with stresses and construction of arches.

DIE CASTINGS

Design and Use. Die Castings and Their Use in Industry, C. T. Roder. Iron Age, vol. 108, no. 22, Dec. 1, 1921, pp. 1409-1411. Their relation to consumers of sand or malleable castings. Dies and their construction. Designing of castings.

DIESEL ENGINES

Ansaldo-San Giorgio. 300-Hp. Two Cycle Diesel Engine. Engineering, vol. 112, no. 2917, Nov. 25, 1921, pp. 721-722, 10 figs, on supp. plate. Describes new series of engines built by Ansaldo-San Giorgio of Turin and Spezzia, Italy, intended primarily for industrial purposes. Results of tests with two-stroke, single-acting engine with three vertical cylinders.

Beardmore-Tosi. Trials of the Beardmore-Tosi Diesel Engine. Engineer, vol. 132 no. 3437, Nov. 11, 1921, pp. 508-510, 12 figs, one on p. 512. Results of trial are presented. Beardmore-Tosi engine, salient features of which are described, is said to mark distinct advance in four-cycle engine construction. See also Shipbldg. & Shipg. Rec., vol. 18, no. 19, Nov. 10, 1921, pp. 605-606, 3 figs. on pp. 600-601.

Compressorless. A Compressorless Diesel Engine. Power Plant Eng., vol. 25, no. 23, Dec. 1, 1921, pp. 1146-1147, 2 figs. Fuel injected without air, under pump pressure; gradual combustion at constant pressure; air compressed by lower end of piston; crosshead to take connecting-rod thrust.

Electricity Supply and. The Function of the Heavy Oil Engine in Connection with the General Supply of Electricity, Geoffrey Porter. Gas & Oil Power, vol. 17, no. 194, Nov. 3, 1921, pp. 22-24, 2 figs. Discusses oil fuels, Diesel engine, design, especially the Still Engine and advantages of heavy oil engines based on comparative figures From paper read before Diesel Engine Users' Assn.

Sulzer. The New Sulzer Diesel Engine, A. P. Chalkley. Mar. Eng., vol. 26, no. 11, Nov. 1921, pp. 845-846, 2 figs. Describes new Sulzer marine Diesel engine with turbo-scavenging; 1,350 b. hp. at 95 r.p.m.; built by Winterthur Works and being installed in a 9,000-ton deadweight motorship.

DISABLED MEN

Training of. On Behalf of the Industrial Disabled, Gerald A. Boate. Indus. Management, vol. 62, no. 6, Dec. 1921, pp. 345-352, 2 figs. Includes alphabetical list of occupations in which disabled men have been retrained. Scientific selection of suitable occupations for disabled men.

DRAWINGS

Production and. Drawings and Production. Eng. Production, vol. 3, no. 62, Dec. 8, 1921, pp. 533-536. Discussion of Albert F. Guyler's paper with above title read before Instn. Production Engrs.

Suggestions for Making. Drawings and Production, Albert F. Guyler. Eng. Production, vol. 3, no. 61, Dec. 1, 1921, pp. 509-513, 13 figs. Suggestions for the making of drawings. Paper presented before Instn. Production Engrs.

DRILLING MACHINES

Recent Developments. Recent Machine-Tool Developments—XXIII, Joseph Horner, Engineering, vol. 112, no. 2919, Dec. 9, 1921, pp. 780-783, 11 figs. Deals with different types of drilling machines.

DROP FORGING

Modern Practice. Modern Drop-forging Practice, Fred. R. Daniels. Machy. (N.Y.), vol. 28, no. 4, Dec. 1921, pp. 308-312, 7 figs. Notes on trimming forgings; forging heats. Typical examples of drop-forging work.

E

ECONOMIZERS

Feedwater Heaters and. The Selection of Economizers and Feed-Water for Municipal Power-Plants, W. F. Schaphorst. Am. City, vol. 25, no. 6, Dec. 1921, pp. [illegible], 4 figs. Discusses operation of economizers and two types of feedwater heaters.

EDUCATION, ENGINEERING

Early Training. The Education of Engineers, E. A. Allcut. Eng. & Indus. Management, vol. 6, no. 22, Dec. 1, 1921, pp. 633-637. Refers to lack of coordination in connection with early training of engineers and points out discrepancies (starting at elementary schools) with view to their ultimate disappearance or modification.

ELECTRIC COOKING

Dining Car. The Great Northern's New Restaurant Train. Ry. Gaz., vol. 35, no. 19, Nov. 4, 1921, pp. 694-695, 4 figs. Further details of electric cooking equipment.

ELECTRIC FURNACES

Melting and Refining. The Electric Furnace in Melting and Refining, John B. C. Kershaw. Electrician, vol. 87, no. 2270, Nov. 18, 1921, pp. 636-639, 5 figs. Annual review of developments, including modern tendencies in electric-furnace design, the Soderberg electrode, and the Russ electric arc furnace.

Resistance. New Electric Resistance Furnaces for Heat Treating Steel (Nouveaux fours électriques à résistance pour le traitement thermique de l'acier). L'Industrie Electrique. vol. 30, no. 705, Nov. 10, 1921, pp. 405-407, 4 figs. Describes vertical furnace and horizontal continuous furnace developed during war.

Smelting. Smelting Iron Ore Electrically, Frank Hodson. Iron Trade Rev., vol. 69, no. 23, Dec. 8, 1921, pp. 1492-1493. Points out that inexperience and inadequate financing have been responsible for failure of many efforts to place direct processes of steelmaking on practical basis.

ELECTRIC LAMPS, INCANDESCENT

Performance Equations. Simple Equations for the Lamp Performance, H. E. Eisenmenger. Jl. Am. Inst. Elec. Engrs., vol. 40, no. 12, Dec. 1921, pp. 905-912, 7 figs. Author seeks to find new empirical equations for relations between "fundamental quantities" of incandescent lamps (voltage efficiency, candle power. life wattage, current, and resistance). Gives number of new equations for voltage-candle power relations, some of which are so simple that they do not require evolution.

ELECTRIC LOCOMOTIVES

Design. Selecting Designs for Electric Locomotives, A. W. Gibbs. Ry. Age, vol. 71, nos. 21 and 22, Nov. 19 and 26, 1921, pp. 987-989, 4 figs, and pp. 1057-1060, 15 figs. Nov. 19: Describes methods used for testing locomotive and discusses electric locomotive drives. Nov. 26: Tests indicate that non-symmetrical wheel arrangement is essential for best performance. (Abstract). Paper read before Franklin Inst.

Storage-Battery. Storage-Battery Locomotives in Metal Mines, E. V. Daveler and R. E. Renz. Min. & Sci. Press, vol. 123, no. 22, Nov. 26, 1921, pp. 751-752. Describes experience in Butte & Superior mine; provisions for safety; care and service of locomotives. Paper read before Nat. Society Congress.

ELECTRIC MOTORS

Control Equipment for Auxiliary. Control Equipments for Auxiliary Motors, M. D. Wright. Assn. Iron & Steel Elec. Engrs., vol. 3, no. 11, Nov. 1921, pp. 493-506 and (discussion) 507-521, 11 figs. Discusses motor control for steel mill drives, automatic acceleration, voltage drop relays, shunt contactors, etc.

ELECTRIC MOTORS, A.C.

Phase Advancers with Induction. The Oscillating Phase Advancer, W. E. Milton Ayres. English Elec. Jl., vol. 1, no. 7, July-October 1921, pp. 298-306, 9 figs. Discusses savings effected by use of phase advancers with induction motors, covering cost of motor, power factor, distributing system, substation transformers, etc.

ELECTRIC MOTORS, D.C.

Starting Panels. A Drum-Type Starting Panel for Electric Motors. Engineering, vol. 112, no. 2917, Nov. 25, 1921, pp. 726-728, 9 figs. Starter constructed by Brock, Hirst & Co., Ltd., embodies spring-controlled fingers which are self-aligning, and of which contact pressure may be individually adjusted, while drum is ground with copper segments in position so that latter from part of true cylinder and give even contact with fingers.

ELECTRIC RAILWAYS

CAR-YARD LAYOUT. Dead Mileage Saving to Pay for New Car Storage Facilities. Elec. Ry. Jl., vol. 58, no. 20, Nov. 12, 1921, pp. 852-853, 13 figs. Discusses flexible track layout and tipple for loadings and and coal at new car yard of Northern Ohio Traction & Light Co. in Akron.

SWITZERLAND. On the Question of Electric Traction, E. Huber. Bul. Int. Ry. Assn., vol. 3, no. 10, Oct. 1921, pp. 1357-1398, 2 figs. Gives history of single-phase traction in Switzerland and general tabular description of most important Swiss lines. Consumption of energy, load factor, maintenance cost of locomotives, and some results of trials. Bibliography.

ELECTRIC SWITCHES

PIPE FRAMEWORKS. Standard Pipe and Fittings for Outdoor Switching Frames, L. J. Moore. Elec. World, vol. 78, no. 21, Nov. 19, 1921, pp. 1020-1023, 3 figs. Found more convenient to keep in stock and transport; do not require special labor for assembly; can be quickly erected and stand service better than wood frames.

ELECTRIC WELDING

SCIENCE OF. The Science of Electric Welding, W. E. Ruder. Jl. Franklin Inst., vol. 192, no. 5, Nov. 1921, pp. 561-583, 24 figs. Notes on carbon electrode arc welding; metallic arc process; metallography of welds; metal transfer; electrodes; reliability of welded joints; electrical characteristics and equipment; automatic arc welding.

ELECTRON METAL

See Magnesium Alloys.

ELEVATED RAILWAYS

HAMBURG, GERMANY. Ten years of the Hamburg Elevated Railway, Wilhelm Mattersdorff. Elec. Ry. Jl., vol. 58, no. 23, Dec. 3, 1921, pp. 879-895, 16 figs. Describes improvements made in recent years and gives operating data.

ELEVATORS

INTERLOCKS, SURVEY OF. Results of a Survey of Elevator Interlocks and an Analysis of Elevator Accident Statistics, C. E. Oakes and J. A. Dickinson. U. S. Bur. Standards Technologic Papers, no. 202, Oct. 17, 1921, 30 pp. Gives results of field survey of several thousand elevator landings equipped with various types of mechanical and electromechanical interlocks and contact devices. Survey was conducted in connection with preparation of elevator safety code in cooperation with engineers of Am. Soc. Mech. Engrs. Statistics show that 73.8 per cent of all fatal accidents might be prevented by well-designed interlocks.

EMPLOYMENT

CONTINUOUS, PROBLEM OF. The Engineering Approach to the Problem of Continuous Employment, Richard A. Feiss. Bul. Taylor Soc., vol. 6, no. 5, Oct. 1921, pp. 187-194. Deals with problems and importance of stabilization of employment.

EMPLOYMENT MANAGEMENT

TRADE TESTS. The Value of the Trade Test in Industry, Russell J. Waldo. Management Eng., vol. 1, no. 6, Dec. 1921, pp. 351-357, 7 figs. Shows parts of typical trade tests used by writer with unusual success.

ENAMELING

INDUSTRIAL ENAMELED EQUIPMENT. Uses for Industrial Enameled Equipment, Max Donauer. Chem. & Met. Eng., vol. 25, no. 22, Nov. 30, 1921, pp. 1015-1020, 21 figs. Discusses advantages and properties of enameled equipment for various purposes, especially food industries. (Abstract) Paper read before Am. Ceramic Soc.

ENGINEERS

BUSINESS METHODS. Business Methods of European Engineers Compared with Those of American Engineers, Axel Malm. Jl. Engrs.' Club Phila., vol. 38-11, no. 203, Nov. 1921, pp. 389-391. Discusses salesmanship, advertising methods and [illegible] of foreign and American engineers.

ENGINEHOUSES

COLD-CLIMATE. Novel Engine Facilities for a Cold Climate, Ry. Age, vol. 71, no. 22, Nov. 26, 1921, pp. 1049-1051, 2 figs. Describes rectangular enginehouse containing turntable, at Hoornepayne, Ont., constructed by Can. Nat. Ry. Co.

F

FACTORY MANAGEMENT

[illegible]

FANS, CENTRIFUGAL

DESIGN. The Design and Construction of Fans—XIII and XIV, F. G. Whipp. Mech. World, vol. 70, [illegible] Nov. [illegible] and Dec. 2, 1921, pp. 370- [illegible] and calculations of area and pressure; gives table of losses due to friction, design and calculation.

FATIGUE

SAFETY WORK AND. Fatigue Study: A first Step in Safety Work, Frank B. and L. M. Gilbreth. Eng. & Indus. Management, vol. 6, no. 20, Nov. 17, 1921, pp. 557-558. Authors show how fatigue can prove most useful in safety work, and that same methods and devices at present employed in factories and offices can be used effectively to do both types of work.

FILTERS

CLEANING SEWAGE. The Maintenance of Clean Filtering Medium in Sewage Filters, Herbert D. Bell.Surveyor, vol. 60, nos. 1557 and 1558, Nov. 18 and 25, 1921, pp. 345-346 and 375-376, 1 fig. Deals principally with media in percolating filters. Experimental results. Paper read before Assn. Mgrs. Sewage Disposal Works.

FLOOD CONTROL

SAN ANTONIO FLOOD. The Flood of September 1921, at San Antonio, Texas. C. Terrell Bartlett. Proc. Am. Soc. Civ. Engrs., vol. 47, no. 9, Nov. 1921, pp. 443-454, 5 figs. Describes flood in detail and its engineering aspects, and outlines briefly principal geographic, topographic and clinatic features of region.

FLOW IN PIPES

HOT GASES. Flow of Hot Gases in Pipes (Expériences très simples au sujet des mouvèments des gaz chauds dans des tuyaux), J. Seigle. Revue de l'Industrie Minérale, no. 19, Oct. 1, 1921, pp. 607-611, 10 figs. Describes expirements in connection with circulation of hot gases and smoke in furnaces.

FLOW OF STEAM

NOZZLES. Note on the Flow of Air and Steam in Nozzles, Gerald Stoney and Norman Elce. Engineering, vol. 112, no. 2918, Dec. 2, 1921, pp. 750-751. Notes on discharge coefficients which afford evidence that no condensation takes place before throat with wet or saturated steam, and that saturated steam acts down to throat as a perfect gas with adiabatic index of 1.3.

FOREMEN

TRAINING OF. How to Educate Foremen, V. M. Palmer. Indus. Management, vol. 62, no. 6, Dec. 1921, pp. 321-324. Importance of giving them systematic training and method of accomplishing this.

FORGING

FLOW OF METAL. The Flow of Metal During Forging, Harold F. Massey. Mech World, vol. 70, nos. 1820, 1821, and 1822, Nov. 18, 25 and Dec. 2, 1921, pp. 408-410, 424-425 and 444-447, 33 figs. Results of a number of experiments, particularly to study the relation between the action of forging by pressure and by blows. Paper read before Manchester Assn. of Engrs.

FOUNDRIES

CHARGING PLATFORM. Charging Floor with Undercover Storage, Edwin A. Hunger. Iron Age, vol 108, no 23, Dec 8, 1921, pp 1459-1462 7 figs Details of new foundry and machine shop of Duplex Printing Press Co., Battle Creek Mich Notable feature is big charging platform entirely under cover, with storage capacity for 5,000 tons of metal and ten carloads of coke at one time Raw materials unloaded in single operations. Core-making expedited with special cement boxes.

CONVEYORS FOR. Decreasing Foundry Costs Through the Mechanical Handling of Materials, J. M. Macrae. Management Eng., vol. 1, no. 5, Nov. 1921, pp 257-259, 3 figs. Describes application of complete conveyor system installed in the Kelsey Wheel Co. foundry, Detroit, Mich.

MATERIAL-HANDLING EQUIPMENT. Solves Material Handling Problems in Design of New Foundry, H. R. Simonds. Iron Trade Rev., vol. 69, no. 24, Dec. 15, 1921, pp. 1545-1549, 10 figs. Electrically controlled cars for raw materials. storage-battery lift trucks for ladles and castings, and monorail system speed operations in new casting plant in Springfield, Mass. Molding floor routine is flexible. Wood block floor used in all operating departments.

SYSTEMATIZING PRODUCTION. Systematizing Foundry Production, Hubert Bentley. Eng. & Indus. Management, vol. 6, no. 22, Dec. 1, 1921, pp 631-632, 2 figs. Describes efficient system capable of general application in foundry Deals with regulation of supply of castings, method of ordering storage, and recording of work in hand.

FOUNDRY PRACTICE

METAL CASTING. Problems Involved in Casting Metal, Thomas Turner, Foundry vol. 49, no. 3, Dec. 1, 1921, pp. 926-933, 6 figs. With good foundry practice sound castings can be obtained from any metal provided there are no reactions which lead to formation and evolution of gas. (Abstract.) Paper read before Inst. of Metals.

FUELS

RESEARCH. Fuel Research Developments, C. F. Kettering. Jl. Soc. Automotive Engrs., vol. 9, no. 5, Nov 1921, pp 291-296 and 343-344, 15 figs. Discusses multi-cylinder distribution and chemical constitution of mixtures, anti-knock substances, ignition point, future fuel research, etc.

SAWDUST. Sawdust Burned with Aid of Steam Jets. Power, vol. 54, no. 24, Dec 13, 1921, pp 914-917, 3 figs Large industrial plant at Cleveland, Ohio, burns both sawdust and coal under same boilers. Automatic control speeds up stokers when sawdust supply becomes low.

Smokeless. Low Temperature Carbonisation. Eng. & Indus. Management, vol. 6, No. 16, Oct. 20, 1921, p. 445. Describes works erected by Low Temperature Carbonisation, Ltd., Barugh. [illegible] it is claimed, production of smokeless fuel, coalite, together with valuable by-products, is now a commercial proposition.
See also Pulverized Coal.

FURNACES, HEATING

Automatic Grates. Automatic Grates and Their Application in High Temperature Combustion Chambers (Les grilles automatiques dans leurs applications aux chambres de combustion à haute température), F. Verdeaux. La Technique Moderne, vol. 13, no. 10, Oct. 1921, pp. 414-417, 3 figs. Discusses heating furnaces in particular; relation between temperature at fire bridge and fuel consumption; [illegible]

FURNACES, HEAT-TREATING

Springs. Furnaces for Heat Treating Springs. Forging & Heat Treating, vol. 7, no. 11, Nov. 1921, pp. 568-572, 18 figs. Stationary and continuous furnaces; types and arrangement.

FURNACES, HOT-AIR

Testing. Air Management in Furnace Testing, A. C. Willard, A. P. Kratz and V. S. Day. Jl. Am. Soc. Heating & Ventilating Engrs., vol. 27, no. 8, Nov. 1921, pp. 797-812, 11 figs. Describes air-weighing plant for calibration purposes, and the Wahlen gage for measuring small air pressures.

FURNACES, REVERBERATORY

Side Charging. History of Side-Charging of Reverberatory Furnace. Eng. & Min. Jl., vol. 112, no. 22, Nov. 26, 1921, pp. 856-858. Gives summary of litterature on reverberatory smelting of copper ores, including Anaconda method, development of side feeding, fettling, etc., reviews patent situation involved.

FURNACES, ROASTING

Development, America. Evolution of Mechanical Roasting, Arthur S. Dwight. Min. & Metallurgy, no. 180, Dec. 1921, pp. 5-10. Review of outstanding incidents in American lead and copper-smelting industries during last decade of 19th century.

FUSION WELDING

Steel. The Fusion Welding of Steel, S. W. Miller. Iron Trade Rev., vol. 69, nos. 21 and 22, Nov. 24 and Dec. 1, 1921, pp. 1346-1349 anq 1422-1426, 17 figs. Advantages and limitations of oxy-acetylene, electric and thermit processes. Low-carbon steel best adapted to welding. (Abstract.) Paper presented at Am. Iron & Steel Inst.

G

GAGES

Go and not Go. The Need of Gauging for Modern Manufacturing. A. C. Wickman. Can. Machy., vol. 26, no. 17, Oct. 27, 1921, pp. 33-36, 3 figs. Discusses limits in the tapped hole, go and not-go gages, limit of microscopic magnification.

GAS MAINS

Corrosion. External Corrosion of Mains and Services, J. G. Taplay. Gas World, vol. 75, no. 1943, Oct. 15, 1921, pp. 349-250. Discusses electrolytic, acid, and alkaline corrosion. Describes experiments made to determine effect of calcium bicarbonate in earth and wall plaster.

GAS PRODUCERS

Calculations of Gases. Calculations Regarding Gas in Gas Generator With Steam Added to Air Blowing (Calculs comparatifs au sujet des gaz de gazogène, dans le cas d'addition de vapeur d'eau à l'air soufflé), J. Seigle. Revue de Métallurgie, vol. 18, no. 9, Sept. 1921, pp. 608-618, 7 figs. Discusses calorific power per cubic meter, calorific power of the volume of gas from 1 kg. of coal, etc.

Ebelmen. The Fused Ash Gas Producer (Le gazogène à fusion des cendres), A. Fichet. Le Génie Civil, vol. 79, no. 16, Oct. 15, 1921, pp 329-332, 2 figs. Describes Ebelmen system principally, also the Rehmann system.

Lignite Briquets for. Using Lignite Briquettes in Gas Generators (Essais d'utilisation de briquettes de lignite pour le chauffage de fours à gazogène), De Groote. Chaleur et Industrie, vol. 2, no. 18, Oct. 1921, pp. 661-666. Describes favorable experiments with a battery of three Morgan generators; composition of briquettes used, heat balance, ash, composition of gas, etc.

GEARS

Helical. Cutting Helical Gears on Automatic Machine, H. A. Wilson. Can. Machy. vol. 26, no. 19, Nov. 10. 1921, pp. 29-33, 13 figs. Various operations on automatics, including making of stud; dust cap cutting helical gears; chart showing tools used; machine equipped with rear end threading attachment.

Herringbone. Double Helical or Herringbone Gears, Howard H. Talbot. Iron Age, vol. 108, nos. 23 and 24, Dec. 8 and 15, 1921, pp. 1469-1473 and 1531-1533, 17 figs. Dec. 8: Elements of design to combine adequate strength with smooth and continuous action and minimum of friction of contact surfaces. Dec. 15: Use of long addenda in pinion and short addenda in driven gear, to increase the "follow through."

Maag. Maag Gearing, L. J. Le Mesurier. Engineering vol. 112, no. 2919, Dec. 9, 1921, pp 801-805, 20 figs. Describes system of gearing and methods of production developed by Maag Gear Co., Zurich, Switzerland, with which means have been found which enable straight-tooth spur gears to be employed successfully under conditions demanding highest possible peripheral speeds and loads per unit width of tooth. Describes entirely novel grinding process. (Abstract.) Paper read before North-East Coast Instn. Engrs. & Shipbuilders.

GRINDING

Steel Billet. Modern Method of Steel Billet Grinding, R. H. Cannon. Forging & Heat Treating, vol. 7, no. 11, Nov. 1921, pp. 557-559, 3 figs. Advantages of grinding over chipping in relation to wheel cost, labor cost and overhead. Making grinding wheel test.

H

HANDLING MATERIALS

Factories. An organized Transportation Department, John A. MacCrea. Management Eng., vol. 1, no. 6, Dec. 1921, pp. 327-329, 4 figs. Describes briefly organization and principal features of operation of department for moving of material.

Trucks as Conveyors. Making the Truck an Asset in Management, Edward H. Tingley. Management Eng., vol. 1, no. 5, Nov. 1921, pp. 267-271, 9 figs. How special types may be used to save floor space, provide effective storage and minimize moving time between operations.

Waste Elimination. Material Handling an Important Factor in the Elimination of Industrial Waste, H. V. Coes. Mech. Eng., vol. 43, no. 12, Dec. 1921, pp. 803-804 and 825. Points out opportunities in almost every branch of industry to reduce large wastes in material handling. Examples of savings effected, and how to arrive at best method.

HARDNESS

Measurement of Steel Balls. Schleroscope Hardness of Steel Balls, Arthur L. Collins. Iron Age, vol. 108, no. 22, Dec. 1, 1921, pp. 1391-1393, 5 figs. Widely varying results on different sizes. Esplanation of cause and suggested remedy.

Testing. The Hardness Testing of Metals. Eng. Production, vol. 3, no. 58, Nov. 10, 1921, pp. 436-440, 11 figs. Discussion of modern methods. (Abstract.) Progress report of Committee of Eng. Div. of U.S. Nat. Research Council.
The Use of the Scleroscope on Light Specimens of Metals, Fred S Tritton. Metal Industry (Lond.), vol. 19, no. 19, Nov 4, 1921, pp. 361-364, 4 figs. Describes experiments undertaken to find out whether errors existed when using ordinary methods of support, and if so, to find some method of support that would eliminate them.

HEAT TRANSMISSION

Air Space. Air Space Transmission, Percy Nicholls. Jl. Am. Soc. Heating & Ventilating Engrs., vol. 27, no. 8, Nov. 1921, pp. 783-790, 3 figs. Includes abstract of paper by H. C. Dickinson and M. S. Van Dusen on the testing of thermal insulators and presents table prepared by Bur. of Standards, separating, values for radiation and convection.

HEATING, ELECTRIC

Development, Switzerland. The Development of Electric Heating in Switzerland (Die Entwicklung der elektrischen Heizumg in der Schweiz). Gesundheits-Ingenieur, special no., July 1921, pp. 18-27, 15 figs. Describes arrangements developed by Sulzer Bros., Winterthur, Switzerland, in reconstruction of existing hot-water installations, steam and hot-water central-heating plants for use of electricity.

Hot-Water. The Electric Pumping Hot-Water Heating System in the Repair Shop for Electric Locomotives of the Swiss Federal Railway in Bellinzona (Die elektrische Pumpen-Warmwasserheizung in der Reparaturwerkstätte für elektrische Lokomotiven der Schweiz. Bundesbahnen, in Bellinzona. Schweiz. Elektrotechnischer Verein Bul., vol. 12, no. 10, Oct. 1921, pp. 270-274, 4 figs. Describes electric heating installation believed to be largest of its kind.

HEATING, FACTORY

Ventilation and. Heating and Ventilation of Factories, H. H. Angus. Contract Rec., vol. 35, no. 50, Dec. 14, 1921, pp. 1085-1088. General outline of principles involved and methods adopted to maintain satisfactory working temperatures and atmospheric conditions. Paper before Toronto Branch Am. Soc. Mech. Engrs.

HELIUM

Airships. Helium for Airships. Aviation, vol. 11, no. 22, Nov. 28, 1921, p. 635 Discusses available supply, cost of production, repurification plant, etc.

HIGHWAYS

American Practice. A British View of American Highway Practice, A. Dryland. Eng. News-Rec., vol. 87, no. 22, Dec. 1, 1921, pp. 892-894. American vehicle weights regarded as light. Bituminous surfacing for worn concrete roads suggested. Highway research commended.

Cost, Reducing. Can the Cost of Highways be Reduced? Contract Rec., vol. 35, no. 48, Nov 30, 1921, pp 1039-1041. Highway Division of Asso. Gen. Contractors of America have drawn up report indicating factors, exclusive of direct construction charges, which increase cost of hard surfaced roads. See also Eng. & Contracting, vol. 56, no. 23, Dec. 7, 1921, pp. 526-527.

HYDRAULIC TURBINES

BREAKDOWN. Investigation of Breakdown of 30,000-Kw. Turbine. Power, vol. 54, no. 21, Nov. 22, 1921, pp. 788-793, 13 figs. Account of accident in Schuylkill plant of Philadelphia Elec. Co. and conclusions from investigation. Points out that abrupt changes of section and formation of sharp angles in design of bucket wheels should be avoided.

DESIGN. Certain Features Relating to Hydraulic Turbine Design and Settings, E. W. Burbank. Proc. La. Eng. Soc., vol. 7, no. 4, Aug. 1921, pp. 150-173, 8 figs. Discusses formulas and terms used, reaction and impulse types of turbines and their operation.

SAND-REMOVING PLANT. Wear in Hydraulic Turbines and How to Avoid it (L'usure des turbines hydrauliques, ses conséquences et les moyens d'y parer), H. Dufour. Bulletin Technique de la Suisse Romande, vol. 47, no. 22, Oct. 29, 1921, pp. 253-256, 6 figs. Describes sand-removing plant at Monthey works of Société pour l'Industrie Chimique à Bâle.

HYDROELECTRIC DEVELOPMENTS

QUEENSTON-CHIPPAWA. The Chippawa-Queenston Power Canal. Can. Engr., vol. 41, no. 23, Dec. 8, 1921, pp. 1 and 10, 6 figs. Big Ontario power development practically completed. Canal is 12½ mi. long with max. depth of 145 ft.; available gross head, 315 ft.; width of concrete section, 48 ft.; depth of water, 35-40 ft.; total earth excavation, 13,299,000 cu. yd.; total rock excavation, 4,182,000 cu. yd.; max. capacity of each turbine, 60,000 hp.; total weight of each complete generating unit, 1,853,000 lb.

ST. LAWRENCE RIVER. Hydro Report on St. Lawrence River. Can. Engr., vol. 41, nos. 21, 22, 23, and 24, Nov. 24, Dec. 1, 8 and 15, 1921, pp. 1, 4-5; pp. 1, 4, 5, 9, and 10, 5 figs.; pp. 4-5; and 9-10. Suggests three alternative schemes for power development and gives cost of each. Study of physical conditions Ontario Hydroelectric Commission's engineering report to Int. Joint Commission.

The St. Lawrence Power Development. Can. Engr., vol. 41, no. 22, Dec. 1, 1921, pp. 1, 10, 11 and 12, 4 figs. Salient features of report by Hugh L. Cooper to Int. Joint Commission on navigation and power in St. Lawrence River. Recommends Croil Island as site for main dam and power plant.

HYDROELECTRIC PLANTS

220,000-VOLT. First 220,000-Volt Station Completed. Elec. World, vol. 78, no. 23, Dec. 3, 1921, pp. 1115-1119, 12 figs. Describes Big Creek No. 8 Station built by Southern Cal. Edison Co.; has 22,500 kw. vertical reaction turbine; lines are operated at 150,000 volts and will be at 220,000 volts ultimately.

I

INDUSTRIAL MANAGEMENT

ASSEMBLING METHODS. Saving time in Assembling, Albert A. Dowd and Frank W. Curtis. Machy. (N.Y.), vol. 28, no. 4, Dec. 1921, pp. 296-300, 6 figs. Examples showing savings resulting from investigation of assembling methods.

EXECUTIVE CONTROL CHARTS. Comparability of Executive Control Charts, Arthur R. Burnet. Management Eng., vol. 1, no. 5, Nov. 1921, pp. 283-288, 7 figs. Fundamental requirement of the "Z" chart and how it may be secured.

FACTORY INVESTIGATIONS. How Factory Investigations Reduce Costs. Machinery (Lond.), vol. 19, no. 476, Nov. 10, 1921, pp. 149-154, 7 figs. Discusses handling of materials, inspection and salvage. manufacturing a fly-wheel pulley, savings affected by use of punch press, etc.

FINANCIAL CONTROL. The Parallel of Control in Business, Frederic H. Leland. Management Engr., vol. 1, no. 6, Dec. 1921, pp. 348-350, 1 fig. Points out that there are two scales of parallel lines of business control, a major scale, which shows correctly amount of money involved in principal activities of business; and minor scale which shows money involved in greater detail than [illegible] scale.

[illegible] Leaks We Have Stopped, A. H. Cubberley. Factory, vol. 27, no. 6, Dec. 1921, pp. 743-747, 2 figs. Analysis of principal financial leaks and how to stop them. Practice at E. I. du Pont de Nemours Co. Works.

FUTURE OF. Scientific Management—XXXIII, Henry Atkinson. Eng. & Indus. Management, vol. 6, no. 19, Nov. 10, 1921, pp. 529-531. Future of scientific management. (Concluded.)

GANTT CHARTS. The Gantt Chart—IV, Wallace Clark. Management Eng., vol. 1, no. 5, Nov. 1921, pp. 279-282, 3 figs. Its application to plant load.

[illegible] Plants, George H. Shepard. Machy. (N.Y.), vol. 28, no. 4, Dec, 1921, pp. 268-270, 1 fig. Organization of [illegible]

[illegible], Howell B. May. Indus. [illegible], Dec. 1921, pp. 341-344. How new spirit of team- [illegible] co-operative inter- [illegible] foremen and workers and [illegible]

[illegible] Applying "Moving Average" Charts to Industry, [illegible]nent Eng., vol. 1, no. 6, Dec. 1921, pp. 343-348, 9 figs. D[illegible] in production and how it is reduced.

PRODUCTION METHODS. Modern Production Methods — XXIV, W. R. Basset. Am. Mach., vol. 69, no. 23, Dec. 8, 1921, pp. 950-955, 7 figs. Setting piece rates. Points out that incentive factor is as important as securing results for wage given. Examples of rate derivation. Why piece rates should not be cut.

Productive Ways and Means, H. Darbyshire. Eng. & Indus. Management vol. 6, no. 22, Dec. 1, 1921, pp. 618-621, 4 figs. Writer deals with number of essential details with which management and supervising staff of any industrial organization should become familiar.

PROGRESS DEPARTMENT. Estimating and Handling Output of "Modifications." Eng. & Indus. Management, vol. 6, no. 21, Nov. 24, 1921, pp. 601-603. Describes progress organization of factory, where, although lines are standardized and produced upon more or less repetition basis, these lines may be modified time and again to meet specific requirements of customers.

RECORDS FOR ELECTRICAL DEPARTMENT. Efficient Record System for Industrial Electrical Department, J. Elmer Housley. Elec. World, vol. 78, no. 21, Nov. 19, 1921, pp. 1015-1018, 1 fig. Gives forms for motors, lamps, trucks, etc., and describes how to use them.

STORING MATERIALS. Management Problems of the Small Factory, Ernest Cordeal. Indus Management, vol. 62, no. 6, Dec. 1921, pp. 334-340, 7 figs. How Materials are effectively handled and stored.

TOOLROOM ORGANIZATION. Organizing Tool Production. Eng. Production, vol. 3, no. 59, Nov. 17, 1921, pp. 462,466, 15 figs. Procedure in the works drawing office and toolroom.

See also Time Study.

INDUSTRIAL ORGANIZATION

ENGINEERING DEPARTMENT. Organization of an Engineering Department, W. E. Irish. Indus. Management, vol. 62, no. 6, Dec. 1921, pp. 357-361, 1 fig. Author shows plan of organization found suitable to requirements of large steel company and gives account of its working.

KNITTING MILLS. The Organization of Knitting Mills, Carle M. Bigelow. Management Eng., vol. 1, nos. 5 and 6, Nov. and Dec. 1921, pp. 261-265, 7 figs. and pp. 359-364, 6 figs. Nov.: Standardizing physical conditions. Deals with plant layout and routing. Dec.: Standardizing control of material.

INDUSTRIAL RELATIONS

CONSTRUCTION INDUSTRIES. Development of Satisfactory Relationship Between Employer and Employe in Construction Industry, Ernest T. Trigg. Eng. & Contracting, vol. 56, no. 21, Nov. 23, 1921, pp. 479-481. (Abstract). Paper presented before joint meeting of Acad. Political Sci. and Am. Indus. Relations Assn. See also Contract Record, vol. 35, no. 47, Nov. 23, 1921, pp. 1021-1023.

HUMAN FACTOR. The Human Factor in Industry—III, Clarence H. Northcott. Indus. Management, vol. 62, no. 6, Dec. 1921, pp. 363-369. Deals with psychology, instincts and tendencies of worker.

OPEN-SHOP FOUNDRY. The Transition to an Open-Shop Foundry, Paul R. Ramp. Iron Age, vol. 108, no. 22, Dec. 1, 1921, pp. 1395-1398. Methods used with success in training molding-machine workers, with view to increased output.

TRAINING EXECUTIVES. Training the Industrial Relations Executive, Edward S. Cowdrick. Management Eng., vol. 1, no. 6, Dec. 1921, pp. 329-330. Notes on college courses in industrial relations.

WORKS COUNCIL. Industrial Democracy in Great Britain. Clarence H. Northcott. Management Eng., vol. 1, no. 5, Nov. 1921, pp. 295-297. Deals with establishment of a works council; qualifications for membership and voting; and how council is organized.

INSPECTION

SYSTEMS. Inspectors' Reports, Examples and Methods. Eng. & Indus. Management vol. 6, no. 20, Nov. 17, 1921, pp. 570-573. Discussion of certain systems of inspection, with view to demonstrating their efficiency under given conditions.

INTERNAL-COMBUSTION ENGINES

MARINE. Internal Combustion Engines in Marine Service—II, Charles Edward Lucke. Jl. Am. Soc. Mar. Draftsmen, vol. 8, no. 3, Oct. 1921, pp. 47-57, 10 figs. Compares new standards of turbine steamer and motorship machinery. Paper read before Franklin Inst.

See also Airplane Engines; Automobile Engines; Diesel Engines; Gas Engines; Oil Engines; Semi-Diesel Engines.

IRON

ELECTRODEPOSITION OF. The Industrial Future of Electro-Deposited Iron, W. E. Hughes. Chem. Age (Lond.), vol. 5, no. 124, Oct. 29, 1921, pp. 521-523, 4 figs. Discusses results of research work and microscopic examination of structure of deposited iron. Sees good future for its application.

ELECTROLYTIC. Commercial Production of Electrolytic Iron, C. P. Perin and Donald Belcher. Min. & Metallurgy, no. 180, Dec. 1921, pp. 17-18, 2 figs. Describes French process consisting of electrolyzing a concentrated solution of ferrous chloride at temperature of 75 deg. cent. Anodes are of cast iron, cathode is a rotating mandrel of steel. With this process tubes and sheets of any desired gage can be made.

IRON ORE

DIRECT REDUCTION. Production of Iron by Direct Reduction of the Ore by the Electrothermal Process (La Production du fer par reduction directe des minerais par voie électrothermique), Marcel Guedras. La Technique Moderne, vol. 13, no. 6, June 1921, pp. 264-265. Describes levoz process, its principles, apparatus and practical results.

IRON AND STEEL

CHEMICAL INDUSTRIES, RELATIONS TO. Relations of the Iron and Steel and Chemical Industries, James M. Camp. Iron Age, vol. 108, no. 21, Nov. 24, 1921, pp. 1329-1331, 1 fig. Notes on chemicals consumed by steel makers; steel used by chemical plants; role of by-products from coke. Paper read before Am. Iron & Steel Inst.

SWEDEN. The Swedish Iron and Steel Industry, Raw Material, vol. 4, no. 10, Oct. 1921, pp. 344-348, 8 figs. Historical review of its development.

IRON, PIG

CALCULATING FOUNDRY VALUE OF. Calculating a Foundry Iron Value, Y. A. Dyer. Iron Age, vol. 108, no. 24, Dec. 15, 1921, pp. 1547-1548. Unit valuation of elements in foundry pig irons. Silicon, manganese and phosphorus considered as metalloids. Carbon and sulphur grouped as Fe.

L

LABOR

CLASSES TO BE AVOIDED. Three Classes of Labor to Avoid, H. A. Haring. Indus. Management, vol. 62, no. 6, Dec. 1921, pp. 370-373. Discusses prejudices and habits displayed by men in certain occupations, and describes effects of certain classes of employment upon individual's fitness for modern industrial work.

LATHE TOOLS

AUTOMOBILE FORGINGS. Cost-Reducing Tooling Equipments, Ralph E. Flanders. Machy. (N.Y.), vol. 28, no. 4, Dec. 1921, pp. 301-305, 13 figs. Employed for machining steering knuckles and other automobile forgings at high rate of production.

LATHES

AUTOMOBILE WORK ON TURRET Automobile Production Work on Turret Lathes, Edward K. Hammond. Machy. (N.Y.), vol. 28, no. 4, Dec. 1921, pp. 261-264, 7 figs. Time-saving and cost-reducing methods developed for use in engine department of motor-car plant.

LIGHTING

HIGHWAYS. Illumination of Highways, C. A. B. Halvorson and R. B. Hussey. Eng. & Contracting, vol. 56, no. 23, Dec. 7, 1921, pp. 535-536, 2 figs. Describes new type of reflector and equipment known as highway lighting unit, consisting of series of nested or concentric parabolic reflectors made of steel and coated with white porcelain enamel; reflectors are so arranged that lignt is directed up and down highway and as much as possible of it confined to road surface. (Abstract). Paper read before Am. Soc. Mun. Improvements.

INDUSTRIAL. Good Lighting Increases Production, J. M. Hickerson. Indus. Management, vol. 62, no. 6, Dec. 1921, pp. 325-328, 2 figs. Summary of major facts brought out by survey of industrial lighting conditions.

Illuminating Engineering: The Future Field' J. H. Asdell. Eng. & Indus. Management, vol. 6, no. 16, Oct. 20, 1921, pp. 441-444. Practical notes on planning an efficient scheme of lighting for industrial purposes, together with simple formula for calculation of illumination in general practice.

METAL-WORKING PLANTS. Lighting Metal-Working Plants to Increase Production, A. L. Powell. Elec. World, vol. 78, no. 22, Nov. 26, 1921, pp. 1069-1072, 7 figs. Proper intensities, spacings and fixtures for benches, machine tools, sheet-metal work, assembling, painting, etc.; general or "localized-general" system of illumination is satisfactory in most cases.

LOCOMOTIVES

FEEDWATER TREATMENT. Water Treatment From an Investment Standpoint, L. F. Wilson. Ry. Rev., vol. 69, no. 19, Nov. 5, 1921, pp. 602-604. Discusses external and internal treatment of locomotive feedwater.

FUEL CONSUMPTION. The Effect of Grade on Locomotive Coal Consumption, George S. Chiles. Ry. Rev., vol. 69, no. 22, Nov. 26, 1921, pp. 715-719, 2 figs. Actual operation of modern equipment illustrates influence of ascending and descending grades.

HORNBLOCKS, MACHINING. Machining Locomotive Hornblocks. Eng. Production, vol. 3, no. 58, Nov. 10, 1921, p. 451, 4 figs. Describes operation on horizontal milling machine.

MODERN DESIGN. Modern Locomotive Engine Design and Construction—LXXV. Ry. Engr., vol. 42, no. 502, Nov. 1921, pp. 421-424 and 439, 3 figs. Discusses coupling-rod design and construction, coupling-rods stresses, etc.

OIL-BURNING. The Lentz Hydraulic Drive for Heavy-Oil Locomotives (Das Flüssigkeitsgetriebe von Lentz für Schwerölkomotiven), H. Wittfeld. Zeit, des Vereines deutscher Ingenieure, vol. 65, no. 45, Nov. 5, 1921, pp. 1160-1163, 4 figs. Discusses efforts heretofore made for rendering internal-combustion engines for heavy oil feasible for locomotive drive with aid of the Lentz hydraulic drive; and gives operating results with trial of first heavy-oil locomotive with such drive.

STEAM PRODUCTION AND USE. On the Question of Economic Production and Use of Steam on Locomotives, G. J. Churchward. Bul. Int. Ry. Assn., vol. 3, no. 10, Oct. 1921, pp. 1527-1538, 1 fig. Abstract of replies to questions on superheated steam, superheater engines and none superheater engines, feedwater treating, and special arrangements, water tube boilers, etc. Appendix describing Riegel water tube locomotive boiler.

STEAM-TURBINE. An early Steam Turbine Locomotive. Engineering, vol. 112, no. 2917, Nov. 25, 1921, p. 728, 4 figs, on p. 730. Details of Belluzzo steam-turbine locomotive constructed in 1908 by Societa Anonima Officine Mecanniche, Milan, and recently dismantled.

STOKER-FIRED. The Locomotive Stoker As An Operating Factor, Frank P. Roesch Ry. Rev., vol. 69, no. 21, Nov. 19, 1921, pp. 685-687. How stoker-fired locomotives can be operated to obtain maximum operating efficiency with minimum expense.

Performance of the Hanna Locomotive Stoker on the Norfolk & Western Railway. Ry & Locomotive Eng., vol. 34, no. 11, Nov. 1921, pp. 308-310, 1 fig. Describes special trial trips showing efficiency of this stoker. Particulars of firebox conditions., etc.

SUPERHEATER. Superheater Practice in American Locomotives. Boiler Maker, vol. 21, no. 11, Nov. 1921, pp. 301-305, 12 figs. Describes most successful methods developed for handling superheater work by railroads.

TRUCKS. On the Question of Bogies (Trucks), Axle and Springs of Locomotives, George Hughes. Bul. Int. Ry. Assn., vol. 3, no. 10, Oct. 1921, pp. 1589-1674, 84 figs. Includes appendixes containing tabular statements on kinds of bogies used by various companies, method of fixing springs for driving and coupled wheels, springing, cylinders, heating surpaces and particulars of two-wheel trucks.

2-8-2- MIKADO. 2-8-2- Type Locomotives for the Nickel Plate. Ry. Mech. Engr., vol. 95, no. 12, Dec. 1921, pp. 737-738, 4 figs. Design based on U.S.R.A., light Mikado with improvements in details. Booster handles 22 per cent additional tonnage.

LUBRICATION

AUTOMOBILE CHASSIS. Various Methods of Chassis Lubrication, Cornelius T. Myers. Automotive Industries, vol. 45, no. 22, Dec. 1, 1921, pp. 1067-1069. Compares lubricating materials and discusses various methods and devices. Condensed from paper read before Soc. Automotive Engrs.

PRIME MOVERS. The Lubrication of Prime Movers, C. H. Bromley. Mech. World, vol. 70, no. 1821, Nov. 25, 1921, pp. 428-429. Discusses oils for steam turbines, emulsion and sludge, Diesel-engine lubrication, etc. (Abstract). Paper read before System Operators' Assn.

LUMBER

CARE IN STORAGE. The Care and Protection of Lumber in Storage, H. A. Sackett. Ry. Age, vol. 71, no. 24, Dec. 10, 1921, pp. 1133-1136, 9 figs. Sanitary precautions to prevent decay; building of piles; and protection against fire.

M

MAGNESIUM ALLOYS

ELECTRON METAL. The Magnesium Alloy "Electron," S. Beckinsale. Metal Industry (N.Y.), vol. 19, no. 11, Nov. 1921, p. 433. Gives chemical analysis of three specimens; hardness and compression tests; microscopic examination; machining properties.

MACHINE SHOPS

DESIGN. The Design and Construction of Engineering Workshops—XXIV, Ernest G. Beck. Mech. World, vol. 70, no. 1817, Oct. 28, 1921, pp. 342-343, 6 figs. Discusses orientation of roofs; glare, glazing, screening, ventilation, etc. (To be continued.)

MACHINE TOOLS

AUTOMATIC. Automatic Machine Tools in Relation to Production Problems, Henry Baker. Machinery (Lond.), vol. 19, no. 477, Nov. 17, 1921, pp. 181-185. Application of mathematical methods to tool setting; idle time; stoppages; economy of extra tools or extra machines.

IMPROVING DETAILS. Tool Details that Improve the Finish of Work in a Machine Shop. Eng. & Indus. Management, vol. 6, no. 21, Nov. 24, 1921, pp. 586-589, 12 figs. Gives practical advice on raising standard of quality of work, and details for improving machine tools, together with explanatory diagrams.

OPERATION CONTROL. Some Notes on the Operating Control of Machine Tools, N. F. Stockbridge. British Machine Tool Eng., vol. 1, no. 12, Nov.-Dec. 1921, pp. 406-412, 11 figs. Discusses the various adjustments of the radial drilling machine up to 4 ft. 6 in. radius.

METAL SPRAYING

SCHOOP PROCESS. Metal Spraying by the Schoop Process, Sidney Mornington. Compressed Air Mag., vol. 26, no. 11, Nov. 1921, pp. 10293-10295, 5 figs. Promises to be of great industrial value for applying zinc or lead to bridges, pontoons, railway cars, and other equipment exposed to action of the elements or exhaust gases.

METALS

FATIGUE. An Investigation of the Fatigue of Metals, H. F. Moore and J. B. Kommers. University of Illinois Bul., vol. [illegible], no. 8, Oct. 24, 1921, 185 pp., 46 figs. Report of investigation [illegible] Engineering Experiment Station in co-operation with Nat. Research Council, Engineering Foundation, and Gen. Elec. Co. Concludes that phenomenon known as fatigue under repeated stress might better be called progressive failure of metals. Most probable explanation seems to be that such failure is progressive spread of microscopic fractures. Bibliography.

[illegible] Eng. & Contracting, vol. [illegible], no. 26, Dec. 28, 1921, pp. 593-596, 5 figs.

HARDENING. On the Theory of the Hardening of Metals, Kotaro Honda. Chem. & Met. Eng., vol. 25, no. 22, Nov. 30, 1921, pp. 1001-1003. Thinks that hardness in metals is due in part to forces between atoms and in part to an interlocked, strained crystalline structure.

LIGHT AND EXTRA LIGHT. Light and Extra Light Metals (Les Métaux blancs légers et ultra-légers), R. de Fleury. La Fonderie Moderne, no. 10, Oct. 1921, pp. 294-298. Discusses alloys with aluminum or magnesium base; compares light and heavy metals casting of aluminum; treatment of light metals alloys of aluminum.

MILLING

PROBLEMS. Some Miller Problems—How They Were Solved., H. A. Wilson. Can. Machy., vol. 26, no. 20, Nov. 17, 1921, pp. 33-34, 4 figs. Milling steel parts to within limits of .002 in. at the rate of 600 per hour; milling four tables at one time, value of gang milling.

MILLING CUTTERS

ACTION OF. On the Art of Milling, John Airey. Mech. Eng., vol. 43, no. 12, Dec. 1921, pp. 783-789 and 798, 17 figs. Account of invrstigation undertaken at University of Michigan for purpose of finding rational basis for action of milling cutter. It is shown that metal is removed more efficiently with thick than with thin chips; thus, under usual conditions, cutter with fewest teeth gives greatest efficiency. Formulas for determining number of teeth for known diameter of cutter and for determining depth are included.

MOLDING METHODS

JARRING MACHINES. Germans Jar Molds Mechanically, U. Lohse. Foundry, vol. 49, no. 23, Dec. 1, 1921, pp. 934-938, 8 figs. Compares different methods of packing sand in molds; mechanical jarring machines, both with and without schock absorbers are described in detail. (Abstract). Staul und Eisen, Sept. 1, 1921.

MOTOR BUSES

COSTS OF CARS AND Bus and Car Costs Compared, H. L. Andrews. Elec. Ry. Jl., vol. 58, no. 18, Oct 29, 1921, pp. 769-771. Compares estimates on operating costs of motor bus, trolley bus and safety car, as given by Thirlwall and Stocks, and defends figures of Thirlwall.

GLOUCESTER, MASS. Transportation by Motor Bus in Gloucester. Elec. Ry. Jl., vol 58, no. 18, Oct. 29, 1921, pp. 773-777, 6 figs. All urban and suburban transportation is by motor bus. Describes equipment; data on buses, fares and routes.

MOTOR-TRUCK TRANSPORTATION

COSTS. A Formula Covering Costs of Heavy Motor Trucking, Charles Hine. Ry. Age, vol. 71, no. 22, Nov. 26, 1921, pp. 1045-1046, 1 fig. Shows superiority of time basis over ton-miles or truck-miles for computing expenses.

MOTOR TRUCKS

BRITISH TYPES. Engineering Features of British Truck Models, M. W. Bourdon. Automotive Industries, vol. 45, no. 20, Nov. 17, 1921, pp 958-963, 14 figs. Des[illegible] features in the 6-ton Maudslay, 4-ton Dennis, and other trucks

ELECTRIC VS GASOLINE. Electric Vehicle Operation Cheaper than Gasoline Truck, Walter R Metz. Elec. World, vol 78, no 24, Dec. 10, 1921, pp 1173-1174, 2 figs Operating costs of electric trucks in government service in Washington, D C., compared with cost of gasoline trucks under similar conditions; electric trucks superior for city requirements.

VIBRATION, REDUCTION OF. Reducing Destructive Vibration in Equipment. Elec. [illegible] 1921, pp. 805-810, 9 figs. Discusses crystallization and fatigue, experience in motor-truck field, use of ball and roller bearings, cushioning shocks, types of cushion wheels, etc.

N

[illegible]

[illegible] Measuring Flow, W. Trinks. Power [illegible] 1044-1045, 4 figs. Methods o[illegible] compressors and steam engines

O

OIL ENGINES

FUNCTION OF. Function of the Heavy Oil Engine in Connection with the General Supply of Electricity, Geoffrey Porter. Petroleum World, vol. 13, no. 254, Nov. 1921, pp. 466-470. Discusses fuels available, compares steam and oil engine stations; local versus bulk electricity supply; etc. (Abstract). Paper read before Diesel Engine Users Assn.

MARINE. Worthington Airless-Injection Oil-Engine. Motorship, vol. 6, no. 11, Nov. 1921, pp. 872-875, 12 figs. Details of a new marine motor for small commercial vessels developed at Blake works, East Cambridge; successful tests run on regular steam-boiler fuel oil with low-consumption results.

TWO-CYCLE. A Two-Cycle Oil Engine. Engineer, vol. 132, no. 3438, Nov. 18, 1921, p. 544, 3 figs. Describes two-stroke hot-bulb type constructed by Marshall, Sons & Co., Ltd., Gainsborough.

OIL FUEL

TEXTILE MILLS. Oil Fuel for Textile Works, J. Veen Stevens. Eng. & Indus. Management, vol. 6, no. 21, Nov. 24, 1921, pp. 597-598. Tests for standardizing quality. Paper read before British Assn. of Mgrs of Textile Works.

OIL SHALES

SCOTLAND. The Scottish Oil-Shale Industry, F. E. J. Foxall-Smedley. Petroleum World, vol. 13, no. 254, Nov. 1921, pp. 445-452, 5 figs. Describes processes of destructive distillation and apparatus, refinery processes and apparatus, and by-products.

OILS

INSULATING. A Research on Insulating Oils, E. B. Wedmore. Electrician, vol. 87, no. 2272, Dec. 2, 1921, pp. 702-704, 5 figs. Discusses spark gaps for testing electric strength of insulating oils and gives results of investigation undertaken to establish a basis which would permit the correlation of measurements taken with different types of spark gaps upon commercial oils.

OPEN-HEARTH FURNACES

PORTS, IMPROVING. Improving Ports of Open Hearths, John W. Kagarise. Iron Trade Rev., vol. 69, no. 22, Dec. 1, 1921, pp. 1417-1421 and 1426, 6 figs. Various types of water-cooled ports are described. Using by-product coke-oven gas introduces difficulty. Paper read before Am. Iron & Steel Inst.

Improvements in Open-Hearth Port Construction, John W Kagarise. Iron Age, vol. 108, no. 21, Nov. 24, 1921, pp. 1324 and 1326-1329. Early types; water-cooled ports; the McKune system and the Venturi and Egler furnaces with some results. Paper read before Am. Iron & Steel Inst.

OXY-ACETYLENE WELDING

MILD STEEL. A Survey of Oxy-acetylene Welding, Lorn Campbell, Jr. Jl. Soc. Automotive Engrs., vol. 9, no 5, Nov. 1921, pp 320-321 and (discussion) 321-322. Discusses the subject as a factor of efficiency in manufacturing; gives reasons why rivets should be replaced by welds; outlines mild steel welding and describes apparatus.

P

PAINTS

DRYING. Artificial versus Natural Means of Drying Paint and Varnish, R. E. Lippert. Jl. Soc. Automotive Engrs., vol 9, no 5, Nov 1921, pp 335-340 and (discussion) 340-343, 13 figs. Describes process for drying coats of paint and varnish by adding heat and moisture simultaneously to air surrounding siccat've coatings through employment of mechanical devices; also describes several humidifying devices.

PAPER MANUFACTURE

SULPHITE PULP, COOKING. Variables in the Cooking of Sulphite Pulp, Benjamin T Larrabee. Paper, vol 29, no 9, Nov 2, 1921, pp 15-16. Discusses variations in operation at different mills, determination of the completion of a cook, digester operations, etc. Paper read before Am. Pulp & Paper Mill Superintendents' Assn.

PATTERNMAKING

LAYOUT AND EQUIPMENT. Pattern-making Lay-out and Equipment, James Edgar. Eng. & Indus Management, vol 6, no. 22, Dec. 1, 1921, pp. 624-625. Practical advice covering essential feature of organization. Notes on type of vice, oosition of machines, and sawing machine.

PATTERNS

STORAGE. The Organization of a Pattern Stores, H. Varley. Eng. & Indus. Management, vol. 6, no 19, Nov 1921, pp. 522-525, 10 figs. Describes storage method and manner of running stores which is claimed to be common-sense application of systematic routine reduced to its simplest terms.

PAVEMENTS, BRICK

Foundations. Foundations for Brick Pavements, F. M. [illegible]. Can. Engr., vol. 41, no. 21, Nov. 24, 1921, pp. 1 and [illegible], 4 figs. Construction of rigid and non-rigid foundations for vitrified brick highway surfaces. Mixing and laying concrete for rigid foundations. Paper read before Highway Eng. Conference, University of Pa.

PEAT

Air-Drying. The Air-Drying of Peat, Ernest V. Moore. [illegible] Industry, vol. 40, no. 19, Oct. 15, 1921, pp. [illegible]-230[illegible]. Notes on process of manufacturing air-dried peat fuel, and uses.

PIERS

Testing Concrete Foundation. Testing Concrete Foundation Piers of Chicago Union Station Co., R. F. Imler. Eng. World, vol. 19, no. 6, Dec. 1921, pp. 399-400, 3 figs. By use of locomotive crane travelling on temporary tracks, 1200 tons of 130-lb. steel rail were unloaded from cars and piled upon platform formed by 16 steel I-beams and four plate and angle girders.

PILES

Gages for Test Driving. The Gauging of Penetration in Pile-Driving, Ernest Latham. Engineering, vol. 112, no. 2916, Nov. 18, 1921, pp. 684-686, 7 figs. Results of tests with inertia gages.

PIPE, CAST IRON

Centrifugal Casting. Manufacture of Cast Iron Pipe by Centrifugal Methods, F. W. Hudson. Contract Rec., vol. 35, no. 48, Nov. 30, 1921, pp. 1038-1039, 2 figs. Describes the DeLavaud process and machinery. Comparison of centrifugal product with sand-cast pipe.

PIPE, STEEL

Protective Covering. Protective Covering for Steel Pipe, L. M. Klauber. Gas Age-Rec., vol. 48, nos. 14 and 15, Oct. 22 and 29, 1921, pp. 478-484 and 514-516, 21 figs. Oct. 22: Describes method of covering pipe for protection in corrosive soils used by San Diego Consolidated Gas & Elec. Co. The clean pipe is dipped into hot asphalt, wrapped with chemically and electrically resistant asbestos felt, redipped in asphalt and wrapped spirally with burlap. Oct. 29: Tests with some coverings, materials for wrapping, life of pipe, etc.

PISTONS

Machining Bosses. Machining Piston Bosses. Eng. Production, vol. 3, no. 58, Nov. 10, 1921, p. 450, 3 figs. Describes method for intensive production.

POLE LINES

Longer Spans. Longer Spans Proposed for Rural Lines. Elec. World, vol. 78, no. 24, Dec. 10, 1921, pp. 1168-1170, 3 figs. By selecting conductors with high elastic limit and properly guying poles at sharp corners and dead-ends urban factors of safety can be obtained with poles placed 250 ft. apart.

POWER

Costs. How to Follow Up Power Costs—II, N. A. Craigue. Indus. Management, vol 62, no. 6, Dec. 1921, pp. 354-356, 1 fig. Discusses various methods of distribution, such as by estimated percentages, by metered amounts, and unit cost or cost constant method.

Hydraulic, Storage of. Mechanical Storage of Power in Italy, G. Müller. Power, vol. 54, no. 21, Nov. 22, 1921, pp. 804-805, 2 figs. Discusses storage of hydraulic energy by using surplus power during periods of high water or low demand, to pump water from tailrace back to higher level for use during peaks or periods of drought. Notes on the Viverone plant, Funghera mechanical storage plant, and a large one under construction.

POWER GENERATION

Fuel Economy. Fuel Economy by the Adoption of Scientific Management in Steam (Power) Generation and Utilization, David Brawnlie. Eng. & Indus. Management, vol. 6, nos. 17, 18, 19, 20, 21 and 22, Oct. 27, Nov. 3, 10, 17, 24 and Dec 1, 1921, pp. 475-478, 516-520, 549-552, 559-562, 593-594 and 626-630 and 637, 31 figs. Oct. 27: Boiler feedwater meters. Nov. 3: Steam meters Nov. 10: Steam meters and feedwater regulators. Nov. 17: Feedwater regulators and coal weighing. Nov. 24: Coal weighing. Dec. 1: Economizers.

POWER PLANTS

Code on Definitions and Values. Code on Definitions and Values. Mech. Eng., vol. 43, no. 12, Dec. 1921, pp. 805-810 and 821. Preliminary draft of fourth in series of 19 codes in preparation by A.S.M.E. committee on power tests codes.

Design. Developments in Power Station Design. Engineer, vol. 132, nos. 3447, 3438, 3439 and 3440, Nov. 11, 18, 25 and Dec. 2, 1921, pp. 502-504, 5 figs.; 530-532, 8 figs.; 558-559, 4 figs.; and 600-601, 7 figs. Nov. 11: Lopulco pulverized-coal feeders and equipment. Nov. 18: Self-cleaning multiple-retort stokers; ash-removal equipments. Nov. 25: Coal-storage system of Ed. Bennis & Co., Ltd., and ash removal from boiler houses. Dec. 2: Pneumatic coal-handling plant at Bankside electric generating station, London.

Oiling Systems. Central Oiling Systems for Power Plants. Power House, vol. 14, no. 21, Nov. 5, 1921, pp. 32-33. The treatment of oil for continuous use; correct lubrication; impurities; precipitation; filtration; entrained water;action of heat; filtering materials; separation of water.

Operation. Refinements of Practice in Modern Power Plants, I. L. Kentish-Rankin. Power Plant Eng., vol. 25, no. 24, Dec. 15, 1921, pp. 1190-1192. Turning steam into cold pipe lines; handling hot water, precautions for instrument piping; flue dusts and their chemical actions; moisture in superheated steam lines.

Records and Accounting. Power Plant Records and Accounting, Einar Winholt. Power Plant Eng., vol. 25, no. 24, Dec. 15, 1921, pp. 1193-1196, 6 figs. Discusses total cost of operating power plant, distribution of cost, and gives forms.

Waste in. Waste in Industrial Power Plants, David Moffat Myers. Management Eng., vol. 1, no. 6, Dec. 1921, pp. 370-371. Notes on how to determine efficiency of operation.

POWER TRANSMISSION

Waves. Wave Transmission of Power. Steamship, vol. 33, no. 389, Nov. 1921, pp. 142-154, 13 figs. Theoretical discussion by G. Constantinesco. Discusses power transmission by waves through liquids and its application to rock drills, riveters, etc. made by W. H. Dorman & Co., Shafford, Eng.

PRODUCER GAS

Coke-Oven Heating. Producer Gas for Coke Oven Heating. Colliery Guardian, vol. 122, no. 3177, Nov. 18, 1921, pp. 1403-1404, 5 figs. Discusses trend of progress in coke industry. Notes on Koppers regenerative coke oven and regenerative gas oven.

PULVERIZED COAL

Assay Muffles. Firing Assay Muffles with Pulverized Coal, E. H. Hamilton. Min. & Metallurgy, no. 180, Dec. 1921, p. 24, 2 figs. Describes satisfactory burning of pulverized coal in assay furnaces of U. S. Smelting Refining & Mining Co., Midvale, Utah. Details of furnaces.

Power-Plant Equipment. Burning Pulverized Anthracite Mine Waste, O. M. Rau. Elec. Ry. Jl., vol. 58, no. 22, Nov. 26, 1921, pp. 945-949, 8 figs. Results of tests obtained by burning pulverized anthracite coal in Philadelphia Rapid Transit Company's power plant; pulverizing equipment installed for ten boilers.

PUMPS

Air-Lift. Air-Lift in Theory and Practice, A. W. Allen. Min. & Sci. Press, vol. 123, no. 21, Nov. 19, 1921, pp. 711-712. Discusses essentials for air lifting, design of rising main, elevating solids by air lift, elasticity, and advantages and disadvantages of air lift.

Rotary. Imbye Pumping, with Special Reference to the Feuerheerd Pump, S. H. Cashmore. Colliery Guardian, vol. 122, no. 3172, Oct 14, 1921, pp. 1073-1074, 5 figs. Comparison of various types of pumps; describes the Feuerheerd pump which is claimed to have a great future. Read before South Staffordshire and Warwickshire Inst. Min. Engrs.

PUMPS, CENTRIFUGAL

Impellers. Open vs. Closed Impellers in the Brockton Sewage Pumping Plant, H. S. Crocker. Eng. News-Rec., vol. 87, no. 21, Nov. 24, 1921, pp. 854-856. Experience at Brockton, Mass., shows that open-type impeller properly designed will give greater output and higher efficiency than enclosed one for small high-speed pumps.

PYROMETERS

Féry. The Measurement of Temperature—XV, P. Field Foster. Mech. World, vol. 70, no. 1819, Nov. 11, 1921, pp. 382-383, 8 figs. Describes the Féry radiation pyrometer.

Recording and Non-Recording. Pyrometer Solves Temperature Problems, John P. Goheen. Foundry, vol. 49, no. 23, Dec. 1, 1921, pp. 938-939. Discusses non-recording and recording pyrometers and their application, temperature control of furnaces, etc. Paper to be read before Am. Inst. Min. & Met. Engrs.

R

RAILLESS TRACTION

Double-Trolley Omnibus. Trolley Omnibus Developments. Tramway & Ry. World, vol. 50, no. 25, Nov 17, 1921, pp. 257-260, 4 figs. Describes Staaker-Clough trolley omnibus with double trolley.

Europe in. Trackless Trolleys at Work Abroad, Walter Jackson. Elec. Ry. Jl., vol. 58, no. 24, Dec 10, 1921, pp. 1027-1032, 2 figs. Describes installations of Tees-side and York in England and Vienna in Austria and gives operating costs.

Trackless Trolleys. Trackless Trolleys at Work Abroad, Walter Jackson. Elec. Ry. Jl., vol. 58, no 20, Nov. 12, 1921, pp. 859-863, 4 figs. Discusses systems of Bradford and Leeds and gives particulars of operating costs.

Westinghouse-Packard Trolley Bus. Recent Trolley Bus Developments, K. A. Simmon. Automotive Manufacturer, vol. 43, no. 7, Oct. 1921, pp. 15-18, 5 figs. Describes Westinghouse-Packard trolley bus, a truck chassis with electric motors in tandem furnishing power. Results of tests.

RAILWAY ELECTRIFICATION

Boston-Washington. Plan for Electrifying Sections of Eleven Railroads. Ry. Mech. Engr., vol. 95, no. 12, Dec. 1921, pp. 739-743, 9 figs. Superpower report provides for [illegible] of power supply in region between Boston and Washington.

Brazil. The Paulista Electrification, S. B. Cooper. Ry. & Locomotive Eng., vol. 34, no. 11, Nov. 1921, pp. 304-306, 3 figs. Discusses new line of Companhia Paulista de Estradas de Ferro, between Jundiahy and Campinas, Brazil. Baldwin-Westinghouse electric locomotives type 2-4-0+0-4-2 for passenger service and 0-6-0+0-6-0- for freight .

Chile. Chile Starts on Extensive Electrification Program. Elec. Ry. Jl., vol. 58, no. 23, Dec. 3, 1921, pp. 991-993, 5 figs. First zone of State Railways, comprising 144 miles, which includes Valparaiso-Santiago line, to be completely electrified at 3,000 volts d. c.

France. Electrification of French Railways and American Experience (L'Electrification des Chemins de fer Français et l'expérience Américaine), A.-R. Garnier. La Technique Moderne, vol. 13, nos. 4, 5, 7, and 8, Apr. May, July and Aug. 1921, pp. 167-173-, 209-217, 305-315 and 346-356, 19 figs. Apr.: Gives tabulation of efficiency of single and three-phase systems; cost of installation; American and Canadian lines; etc. May: Reviews French, Swiss, Italian, German and American electrification; power, substations and their equipment, motor generators, locomotives, etc. July: High and low-tension apparatus, direct control for fast trains, auxiliaries transmission systems, etc. Aug.: Practical results obtained in Europe and America; tables of power consumption etc. of various lines; further electrification projects by French roads. (Concluded.)

RAILWAY OPERATION

Automatic Train Control. An Automatic Mechanical Train Controller. Engineer, vol. 132, no. 3437, Nov. 11 1921, pp. 520-521. 4 figs. Details of device for automatical y giving warning in cab of locomotive of position of signals on line, and for simultaneously applying brakes.

Automatic Train Control, North Eastern Railway. Ry. Gaz., vo . 35, no. 21, Nov. 18, 1921, pp. 765-767, 5 figs. Describes system which has been in use for many years. and is applicable to engines and stock fitted with Westinghouse, Westinghouse and vacuum combined, or vacuum brakes alone.

The "Daniels" Automatic Train-Stop. Ry. Gaz., vol. 35, no. 19, Nov. 4, 1921, pp. 683-685, 5 figs. New, exclusively mechanical, train-stop, designed to give warning at distant signal and to cause a partial application of brakes, and at stop signals, should they be passed at "danger," to cause a further positive brake application, and to shut off steam. Apparatus provides for a distinct audible indication as a "clear" signal of either type is passed.

Lackawanna. Lackawanna Success the Result of Supervision, Charles W. Foss and James G. Lyne. Ry. Age, vol. 71, nos. 22 and 23, Nov. 26, and Dec. 3, 1921, pp. 1027-1032 and 1097-1102, 24 figs. Nov. 26: Notes on service, elimination of grades and curvature, locomotives, freight and passenger cars, and handling of coal. Dec. 3: Details of handling of coal and manifest freight.

Light Railways. On the Question of Operation of Light Railways, Working Rules and Regulations, F. Level. Bul. Int. Ry. Ass., vol. 3, no. 10, Oct. 1921, pp. 1471-1482. Summary of replies from 106 administrations to questions regarding classes of tickets, issuing, collecting, checking, etc.

Safety Appliances. On the Question of Safety Appliances on Light Railways, A. Bonnevie. Bul. Int. Ry. Assn., vol. 3, no. 10, Oct. 1921, pp. 1539-1588. Gives tabulation of lines in various countries and the length, gage, gradients, curve radii, maximum load, brakes, couplings, speeds, number of trains, track, signals, etc.

RAILWAY SHOPS

Operations and Apparatus. Railroad Shop Operations and Apparatus, Frank A. Stanley. Am. Mach., vol. 55, no. 23, Dec. 8, 1921, pp. 922-923, 9 figs. Describes "home-made" acetylene gas generator; cutting continuous threads on staybolts; systematic arrangement of tools.

RAILWAY SIGNALING

Liverpool Overhead Railway. The Re-Signaling at the Liverpool Overhead Railway. Engineer, vol. 132, no. 3436, Nov. 4, 1921, pp. 488-489, 3 figs. Signaling is arranged on a 2-min. service, but actually is based on interval between trains of 100 sec. Notes on overlaps; light signals; color-light signals; track transformers, relays, etc.; train stops; and emergency cross-over roads.

Track Circuits, A.C. Shunting Characteristics of the Relay in an A-C. Track Circuit Employed in Railroad Signaling, C. F. Estwick. Jl. Am. Inst. Elec. Engrs., vol. 40, no. 12, Dec. 1921, pp. 919-925, 5 figs. Study of various characteristics of track circuit particularly in connection with shunting action

RAILWAY TRACK

Crossings. Railroad Crossings and Crossing Signs, R. S. Messenger. Elec. Ry. Jl., vol. 58, no. 17, Oct. 22, 1921, pp. 744-745. Suggests standardization to reduce accidents. (Abstract). Paper read before National Safety Council.

RAINFALL

[illegible] High Rates of Rainfall, Allen Hazen. [illegible] 1921, pp. 858-860, 6 figs. A probability-method study of data for Eastern and Middle Western States in Mor[illegible] and Meyer's "Elements of Hydrology".

[illegible]ATION

[illegible] in Florida. Eng. World, vol. [illegible] dragline operation over soft ground.

RECTIFIERS

Mercury-Vapor. Application of Glass Mercury Vapor Rectifiers of Medium Power (Les applications du redresseur a vapeur de nercure de moyenne puissance en verre), Maurice Leblanc. Revue Générale de l'Electricité, vol. 10, no. 21, Nov. 26, 1921, pp. 765-770, 12 figs. Discusses the field between the most powerful glass rectifiers and the least powerful metal rectifiers and endeavors to close this gap.

Mercury-Vapor. Mercury Vapor Rectifiers (Les redresseurs à vapeur de mercure), François Aubert. La Technique Moderne, vol. 13, no. 7, July 1921, pp. 289-298, 25 figs. Discusses importance of converting a.c. to d.c. principle, its properties, early types, difficulty of constructing them for large capacity, and examples of modern high capacity rectifiers.

REFRACTORIES

Research. Report of the Refractories Materials Committee. Gas World, vol. 75, no. 1943, Oct. 15, 1921, pp. 322-324 and (discussion) 324-325, 1 fig. Notes on jointing materials, including softening-point of mixtures of silica brick and clay firebrick, and mixtures of fireclay with fireclay grog; research.

REFRIGERATION

Total-Heat Diagram. Solving Refrigerating Problems by the Total Heat Diagram. Power, vol. 54, no. 22, Nov. 29, 1921, pp. 839-841, 3 figs. Describes use of Mollier diagram or total heat chart based on Goodenough's table of the properties of ammonia.

RELATIVITY

Einstein's Theory. Einstein and the Theory of Relativity, J. H. Jones. Engineer, vol. 132, nos. 3438, 3439 and 2440, Nov. 18, 25, and Dec. 2, 1921, pp. 529-530, 556-558 and 588-599, 2 figs. Nov. 18: The beginnings of relativity. Nov. 25: Distance between two points; time between two events. Dec. 2; Apparent contraction; composition of velocities; Fresnel's convention coefficient; mass and momentum, and mass and energy. Article deals only with Einstein's restricted theory.

RESERVOIRS

Groined-Arch. An English Groined Arch Service Reservoir. Eng. & Contracting, vol. 56, no. 24, Dec. 14, 1921, pp. 550-551, 2 figs. Reservoir of Birkenhead-Almen water supply covers area of 3. 6 acres, and holds 30,000,000 gal., total depth is 32 ft. of which 5 ft. is below ground level; roof consists of 217 concrete domes, each 30 ft. in diam., supported on 432 pillars built in concrete blocks. (Abstract). From Concrete & Constructional Eng.

Reinforced-Concrete. Reinforced Concrete Reservoir at Perty Amboy, New Jersey, George A. Johnson. Am. City, vol. 25, no. 6, Dec. 1921, pp. 451-455, 4 figs. Describes buildings of first 40,000,000-gal. unit of proposed 160,000,000 gal. water-distributing reservoir. It is 900 ft. long, at full water level, with width varying from 230 to 370 ft., and has water depth of 25 ft. Feature of reservoir is said to be design of bottom and top slabs.

ROADS

Impact Tests. Tests of Impact on Pavement by the Bureau of Public Roads, C. A. Hogentogler. Pub. Roads, vol. 4, no. 6, Oct. 1921, pp. 3-18, 10 figs. Results of tests on road slaps, for purpose of throwing light on behavior and resistance of various types of pavements when subjected to forces similar to those produced by heavy motor trucks.

See also Eng. News-Rec., vol. 87, no. 23, Dec. 8, 1921, pp. 944-947, 8 figs.

ROADS, BRICK

Rolled-Base. "Rolled-Base" Brick Roads in Ohio, A. T. Goldbeck and F. H. Jackson. Eng. & Contracting, vol. 56, no. 23, Dec. 7, 1921, pp. 528-529. Account of Inspection of number of brick roads of so-called "rolled-Base" type conducted by authors for purpose of obtaining information regarding their behavior under various traffic and subsoil conditions. Includes description of roads together with comments regarding methods of construction, soil drainage, and traffic conditions. (Abstract.) Public Roads, Nov. 1921.

ROLLING MILLS

Electrically Driven. Motoe Equipment for Main Drive of Rolling Mills. Electrician, vol. 87, no. 2270, Nov. 18, 1921, pp. 647-653. List of particulars of electrically-driven rolling mills.

The Future of the Electrically Driven Rolling Mill, L. Rothera. Electrician, vol. 87, no. 2270, Nov. 18, 1921, pp. 632-633. Discusses cost of production and electric drive, influence of power factor, and the chance for the gas engine with available-gas supplied from blast furnaces and coke ovens.

Motors, Size of. Factors which Influence the Size of Rolling Mill Drives, L. Rothera. English Elec. Jl., vol. 1, no. 7, July-October 1921, pp. 291-297,8 figs. Discusses power demand for rolling various sections, output rquired and methods of rolling, as factors in determining size of motor.

ROPE

Fibre. Ribre Rope (Cables de fibra). Ingenieria Internacional, vol. 6, no. 6, Dec. 1921, pp. 321-325, 7 figs. Discusses power transmission rope, single and multiple transmission systems, tensile strength, calculations, etc.

Manila. Results of Some Test of Manila Rope, Ambrose H. Stang and Lory R Strickenberg. U.S. Bur. of Standards Technologic Papers, no. 198, Sept. 15, 1921, 11 pp. Summary of results of tensile tests of 368 specimens of rope, all of which were 3-strand, regular lay manila rope having diameters from ½ in. to 4½ in. are given in tables and graphically. Gives formula for determining average breaking load as function of diameter of rope. Ropes showed continually varying modulus of elasticity and no well-defined proportional limit.

RUBBER

Aging. The Aging of Rubber. Andrew [illegible] A. Mar. Eng., vol. 25, no. 23, Dec. 7, 1921, pp. 1039-1042. [illegible] acceleration of oxidation; depolymerization; [illegible] aging.

Microsectioning. Recent Development in the Art of Rubber Microsectioning, Henry Green. Jl. Indus. & Eng. Chem., vol. 13, no. 12, Dec. 1921, pp. 1130-1132, 11 figs. Describes [illegible] method [illegible] freezing method. Paper read before Am. Chem. Soc.

Vulcanization. The Relation between Coefficient of Vulcanization and Mechanical Properties of Vulcanized Rubber, O. de Vries. Jl. Indus. & Eng. Chem. vol. 13, no. 12, Dec. 1921, pp. 1133-1134. Results of investigations showing that the natural accelerator or accelerators in rubber cause an increase in coefficient of vulcanization for fixed mechanical properties which amounts to about 0.5 for all types of quick-curing rubber, independent of their composition.

S

SAFETY

Inspection. Safety Inspectors and Inspections, John A. Dickinson. Am. Mach., vol. 55, no. 22, Dec. 1, 1921, pp. 887-869. Diffeernt types of inspection. Importance of standardizing safeguards. Advantages of helping inspectors.

SANITATION

Engineering Problems. Sanitary Engineering Problems and Progress. Eng. News-Rec., vol. 87, no. 22, Dec. 1, 1921. pp. 904-908. Abstracts of paper, reports and discussions at meeting of Am. Pub. Health Assn. and conference on sanitation problems held by Am. Soc. Civ. Engrs., dealing with stream pollution and sewage disposal, water supply and water purification, street cleaning and solid wastes disposal, and odors and their travel.

SCALES

Inspection and Maintenance. Inspection and Maintenance of Weighing Scales, Herbert T. Wade, Management Eng., vol. 1, no. 5, Nov. 1921, pp. 289-294, 10 figs. Describes scale-inspecting department of the Scovill Mfg. Co., Waterbury, Conn. Scale service organization.

Locomotive. Locomotive Weighing Plant of large Capacity, Carl C. Bailey. Ry. Mech. Engr., vol 95, no. 12, Dec. 1921, pp. 749-750, 3 figs. Heavy scale is housed in special building with equipment for determining all wheel loads at one time.

SCIENTIFIC MANAGEMENT

See Industrial Management; Taylor System.

SEMI-DIESEL ENGINES

Beardmore. Construction of Internal-Combustion Engines. Shipbldg. & Shipg. Rec., vol. 18, no. 22, Dec. 1, 1921, pp. 703 708, 9 figs. Describes the Beardmore semi-Diesel oil engines.

SEWER CONSTRUCTION

Soft-Ground Tunnels. Construction Systematized in Soft Ground Tunnel. Eng. News-Rec., vol. 87, no. 23, Dec. 8, 1921, pp. 940-942, 7 figs. Steel lines plates hold roof with shallow cover; pneumatic spades effective; concrete deposited through chutes driven through ground.

SEWERS

Inverted Siphons for. Inverted Siphons for Sewers. Eng. & Contracting, vol. 56, no. 24, Dec. 14, 1921, pp. 552-555. Outlines principles and practice relating to inverted siphons. (Abstract.) Committee report before Boston Soc. Civ. Engrs.

SHAPERS

Use in Production work. Production Shaping. Machy. (N.Y.), vol. 28, no. 4, Dec. 1921, pp. 272-276, 9 figs. Use of shapers in production work in machine-tool building plants.

SHIP PROPULSION, ELECTRIC

Merchant and War. Electric Propulsion of Ships, W. E. Thau. Advance Copy, Soc. of Naval Architects & Mar. Engrs., meeting Nov. 17-18, 1921, No. 4, 17 pp. 5 figs. Discusses propulsive equipment for merchant ships, turbine electric propulsive equipment, Diesel-electric equipment, and principal phases of electric propulsive equipment for war vessels.

SHIPS

Liners. England's Latest Type of Ocean Liner, The Scythia. Mar. Eng., vol. 26, no. 11, Nov. 1921, pp. 819-824, 15 figs., partly on supp. plates. Built by Vickers Ltd. Displacement 27,000 tons; 13,000 s.hp.; speed 17 knots; oil consumption 1,106 lb. per s. hp. Describes equipment and passenger accommodation.

SILICA BRICK

Manufacture and Use. Manufacture and Use of Silica Brick, Jefferson Middleton. Cem. Mill & Quarry, vol. 19, no. 9, Nov. 5, 1921, pp. 25-27. How material is ground and washed . Burning brick in circular down-draft kilns. Used for purposes where temperatures are high. (Abstract). Mineral Resources of U.S.

STANDARDIZATION

Germany. Industrial Standardization in Germany Auto Motive Industries, vol. 45, no. 23, Dec. 8, 1921, p. 1127. Discusses national standardization as developed in Germany under post-war conditions.

Industrial Standardization in Germany. P. G. Agnew. Jl. Am. Soc. Heating & Ventilating Engrs., vol. 27, no. 8, Nov. 1921, pp. 794-796. Describes advanced state of industrial standardization in Germany. 144 approved standards sheets have been issued and over 500 others have been developed. Notes on organization and methods of work.

Industrial. Industrial Standardization. Jl. Soc. Automotive Engrs., vol. 9, no. 6, Dec. 1921, pp. 359-435, 66 figs. A number of articles on standardization including standardization in Germany, S.A.E. standardization, automobile standardization in Great Britain, decreasing production costs through standardization, and reports of divisions to A.S.E. Standards Committee.

Inter-Works. Standardization and Assimilation, H. Varley. Eng. & Indus. Management, vol. 6, no. 20, Nov. 17, 1921, pp. 554-556. Writer advances plea for wider adoption of inter-works standardization and explains where and how it can be performed and applied.

STANDARDS

German N.D.I. Report. German Industry Committee on Standards (Normenausschuss der Deutschen Industrie). Betrieb, vol. 4, no. 1, Oct. 8, 1921, pp. 1-9, 8 figs. Proposals of the Board of Directors for blank hexagonal nuts, blank washers, low dimensions for drills and countersinks, diameters of core drills; sink-water traps with openings and with covers. Proposed standards for copper and brass.

German Industry Committee on Standards (Normenausschuss der Deutschen Industrie.) Betrieb, vol. 4, no. 2, Oct. 22, 1921, pp. 17-24, 9 figs. Proposed standards for offset and straight-arm hand cranks; brass; vector designations; permissible stresses in building material (mild steel and wood); terminology for cast iron, malleable iron, steel castings.

Importance of. Executives Should Foster Use of Standards. Herbert Chase. Automotive Industries, vol. 45, no. 23, Dec. 8, 1921, pp. 1101-1107, 2 figs. Proper use of standard specifications, fittings and dimensions tends to eliminate waste save time and cut expenses. Engineers know value of standards, but executives have, in general, failed to realize their importance and encourage their use.

STEAM-ELECTRIC PLANTS

Superpower System. Steam-Electric Central Stations Retained for the Superpower System, Arthur R. Wellwood. Power, vol. 54, no. 25, Dec. 20, 1921, pp. 969-972, 5 figs. Existing steam-electric stations retained represent 80 per cent of all such stations in Superpower Zone, and were chosen as result of detailed analysis and study based upon their 1919 performance. Operation of retained plants.

STEAM ENGINES

Exhaust. Simplification and Reduction of Operating Costs of Exhaust-Steam Engines by Simultaneous Utilization of Furnace Waste Heat (Vereinfachung und Betriebsverbillingung von Abdampfkraftanlagen durch gleichzeitige Ausnutzung von Ofenabwärme), Ernst Blau. Fördertechnik u. Frachsverkerh, vol. 14, no. 8, Apr. 15, 1921, pp. 88-90, 4 figs. Describes "Gefa" patented process for operation of exhaust-steam storage plants.

Heat Utilization. The Utilization of Heat in Steam Engines (Wärmeausnutzung bei Kraftmaschinen), K. Heilmann. Zeit. für Dampfkessel u. Maschinenbetrieb, vol. 44, no. 40, Oct. 7, 1921, pp. 315-319, 6 figs. Discusses relations between exhaust-steam utilization and power generation.

STEAM PIPES

Flow in. Machinery and Pipe Arrangement Calculations—XIII, C. C. Pounder. Mech. World, vol. 70, no. 1819, Nov. 11, 1921, pp. 386-388, 1 fig. Continues discussion of safety-valve springs and gives examples and calculations; also discusses weight flow of steam through pipes.

Steam Flow in Pipes, F. M. Van Deventer. Power Plant Eng., vol. 25, no. 22, Nov. 25, 1921, pp. 1096-1098, 1 fig. Steam flow chart for superheated steam and table of pipe sizes.

STEAM POWER PLANTS

Heat-Balance Systems. Heat Balance in Steam Power Plants. Mech. Eng., vol. 43, no. 12, Dec. 1921, pp. 790-796 and 825, 8 figs. Particulars of systems employed in three large modern stations, namely, Delaware Station of Philadelphia Elec. Co., by E. L. Hopping; Hell Gate Station, by J. H. Lawrence and W. M. Keenan; and Colfax Station, by C. W. E. Clarke.

Sanitarium. Steam for Battle Creek Sanitarium. Power Plant Eng., vol. 25, no. 23, Dec. 1921, pp. 1131—1138, 14 figs. Mechanical coal and ash handling automatically controlled underfeed stokers, special water treatment and graphic record system.

Critical Speeds. Simplified Appromixations of Critical Speeds, G. Arrowfmith Engineering, vol. 112, no. 2917, Nov. 25, 1921, pp. 717-720, 8 figs. Points oun that critical speeds can in very many cases be obtained without resource to tedious graphical constructions of bending moment and deflection dirgrrms.

Efficiency Calculations. Turbine Efficiency Calculations, Paul F. Christopher. Power Plant Eng., vol. 25, no. 21, Nov. 1, 1921, pp. 1039-1042, 3 figs. Use of heat-enthropy diagram in calculation of efficiency; estimating power load to meet demands for exhaust steam.

Steam Consumption. A Simple Method of Finding Steam Consumption of Small Turbines. Power, vol. 54, no. 23, Dec. 6, 1921, pp. 895-896, 3 figs. Presents curves for determining water-rate factor for any turbine at any load.

STEEL

Alloy. [illegible]

Carburizing. Present Theories of Carburizing Steel, H. B. Knowlton. Forging & Heat Treating, vol. 7, no. 11, Nov. 1921, pp. 543-548, 14 figs. Application of theories to commercial problems: effect of different temperatures on per cent and distribution of carbon in the case.

Chrome. [illegible]

Composition and Properties. Principal Steels and Their Characteristics and Uses (Les principaux aciers de construction, leur caractéristiques et leurs emplois), P. Dejean. La Houille Blanche, vol. 20, no. 55-56, July-August 1921, pp. 149-151, 3 figs. Gives tables of composition and properties. Discusses carbon steels, mild steels, cementation steels, corrosion resistant steels, etc., and their uses.

Ingots, Defects in. Defects in Ingots and Methods for Remedying Them (Les défauts des lingots et les méthodes pour y remédier), Sigma. La Métallurgie, vol. 53, no 47, Nov. 24, 1921, pp. 2185-2186. Summarizes results of investigations by L. Guillet, including piping, cracks, segregation, etc.

Low-Carbon, Strain Lines in. Strain Lines in Low Carbon Steel, A. Fry. Iron Age, vol. 108, no. 22, Dec. 1, 1921, pp. 1401-1402, 10 figs. New German etching method revealing effects on metal which has been stressed. Origin and character of lines. Translated from Stahl u. Eisen, Aug. 11, 1921.

Magnetic Analysis. Magnetic Analysis of Steel, R. L. Sanford. Am. Mach., vol. 55, no. 21, Nov. 24, 1921, pp. 836-839, 7 figs. Uses of electric current for inspection. Apparatus and method of operation; relation of magnetic to mechanical properties of steel. Advantages and difficulties.

Stainless. Stainless Steel and Its Engineering Applications. Mech. World, vol. 70, no. 1817, Oct. 28, 1921, pp. 346-348, 3 figs. Describes tests made with stainless-steel turbine blades at works of Th. Firth & Sons, Sheffield, showing that the blades remained absolutely unaffected. Also discusses manufacture of stainless steel and its properties.

STEEL, HIGH-SPEED

Heat Treatment. Proper Heat Treatment for High Speed Steel, J. L. Thorne. Can. Machy , vol. 26, no. 19, Nov. 10, 1921, pp. 36-37 and 53.Gives instances of improper heat treatment, object of high temperature furnace; quenching the tool; heating cutting edges.

Tool Steel. Action of Internal Stress on Tool Steel, C. Neil Greenwood. Forging & Heat Treating, vol. 7, no. 11, Nov. 1921, pp. 560-563. Discusses origins of internal stresses in pure metals and alloys, due to cold working and to suppression of phase changes by rapid cooling; volume changes taking place during heating and cooling. (Abstract). Paper read at joint meeting of Faraday Soc. with other institutions.

STEEL INDUSTRY

Research in. Research in the Steel Industry ,John A. Mathews. Min. & Metallurgy, no. 180, Dec. 1921, pp. 11-13. Discusses ways in which research department of steel company may function in order to contribute to success.

[illegible] WORKS

English. Methods in a Modern Stee Works. Eng. Production, vol. 3, no. 62, [illegible] plant and equipment of Thos. Firth [illegible]

STOKERS

Automatic. Use of Automatic Stoking in Industries (L'Emploi des foyers automatiques dans l'industrie), H. Drouot and F. Verdeaux. La Technique Moderne, vol. 13, nos. 8 and 9, Aug. and Sept. 1921, pp. 337-343 and 376-383, 37 figs. Aug: Discusses the various arrangements of grates and stokers, including those by Wackernie, Forney, Leach, Wilkinson, Godillot, Grieve, Babcock & Wilcox, Hotchkiss, Coxe, Ill. Stoker Co.; Green's ash conveyor. Sept. Discusses underfeed stokers and describes apparatus by Donneley, Jones, Riley and Combustion Eng. Corp.

STORAGE BATTERIES

Alkaline. Alkaline Accumulators, Albert Clarke. Beama, vol. 9, no. 5, No. 1921, pp. 446-450, 4 figs. Summarizes construction, production, average performances of, and recent developments of various types.

Hydraulic. Some Experience with Hydraulic Accumulator, J. A. McGillivray. Power House, vol. 14, no. 21, Nov. 5, 1921, pp. 24-27, 3 figs. Discusses some of the difficulties encountered when hydraulic system is called on to supply a heavy overload, and methods adopted to keep plant running.

STREAM POLLUTION

Dilution Factor. The Dilution Factor, Langdon Pearse. Eng. & Contracting, vol. 56, no. 24, Dec. 14, 1921, p. 546. Discusses bases for dilution factor, and gives data drawn from experience of Sanitary District of Chicago. Describes effect of sewage on fish life. (Abstract) Paper before Am. Soc. Civ. Engrs.

STREET RAILWAYS

Track Reconstruction. Reconstruction of Toronto Street Railway System on Large Scale. Contract Rec., vol. 35, no. 47, Nov 23, 1921, pp. 1009-1014, 15 figs. Track rehabilitation carried out by methods designed primarily for speed. Notes on steam-shovel grading, rapid pavement breaking and batch-transfer method of concreting.

STRESSES

Analysis of Internal State of. The Geometry of Progress in Structural Engineering or Euclidian Principles Applied to Stress Analysis and Volunetric. Measurement of Mechanical Intelligence, C. A. P. Turner. Cem. & Eng. News, vol. 33, no. 12, Dec. 1921, pp. 19-25, 3 figs. Writer claims that during past 20 years the structural engineer has advanced little in precise knowledge of internal states of stress in elastic materials of constructing upon which their strength or resistance depends. Refers to idio-syncracies of building code provisions for shear, and inconsistencies of research work, etc., which point to backward rather than forward trend of theoretical progress.

STRUCTURAL STEEL

Joists. Using Steel Lumber in Building, Thomas J. Foster. Iron Trade Rev., vol. 69, no. 21, Nov. 24, 1921, pp. 1350-1352 and 1359, 5 figs. Light steel I-joists, with cross bridging, metal lath and steel accessories have been developed to take place of wood. Light weight and fire-resisting properties are chief advantages. (Abstract). Paper read before Am. Iron & Steel Inst.

SUBSTATIONS

Automatic Converter. Canadian Automatic Converter Sub-Station. Engineering, vol. 112, no. 2918, Dec. 2, 1921, pp. 747-750, 8 figs. Station of Toronto hydro-electric system recently completed is of Westinghouse type, and laid out for 1000-kw, capacity, with provision for extension. Energy is received from high-level sub-station through 13,200-volt, 25-cycle, three-phase overhead transmission line through 300-amp. oil circuit breaker. Details of main converter transforners, rotary transformers, rotary converter, switchboard, etc. Details of operation.

SUPERHEATED STEAM

Industrial Heating. Superheated Steam for Heating Only. Power Plant Eng., vol. 25, no. 24, Dec. 15, 1921, pp. 1199-1200, 1 fig. Describes 3,000 hp. boiler plant of Lever Bros. Co. East Cambridge, Mass.; generates high pressure steam for industrial purposes only.

SURVEYING

Cadastral Resurveys. A Review of Important Developments in the Science of Cadastral Resurveys as Executed by the United States Government, with Ethical Discussion Thereof, Howard R. Farnsworth. Proc. A. Soc. Civ. Engrs., vol. 47, no. 9, Nov. 1921, pp. 405-442, 13 figs. Notes on improvements in field; identification and restoration of corners; identification of alienated lands.

T

TAR

DISTILLATION OF. Tar Distillation and Sulphate of Ammonia Manufacture. Gas World, vol. 75, no. 1943, Oct. 15, 1921, pp. 343-345. Describes different processes of tar dehydration and distillation and different sulphate of ammonia plants.

TAYLOR SYSTEM

CIVIL ENGINEERING. Organization in Public Building Work (L'organisation des travaux publics), C. Andreae. Bulletin Technique de la Suisse Romande, vol. 47, no. 24, Nov. 26, 1921, pp. 277-281, 2 figs. Discusses Taylor system and scientific management for civil engineering as against mechanical, in factories, etc.

TELEGRAPHY

INDUCTIVE INTERFERENCE. Inductive Interference in Telegraph and Telephone Circuits (Perturbazioni induttive sui circuiti Telegrafaci e Telefonici) G. Di Pirro. Telegrafi e Telefoni, vol. 2, no. 4, July-August 1921, pp. 151-170, 27 figs. Discusses electrostatic and electromagnetic induction, kinds of interference and remedial measures, interferences caused by d.c. traction current, etc.

TELEPHONY

GH-FREQUENCY. High Frequency Telephony Along Power Lines (La telefonia ad al ta frequenza sulle condutture industriali coi sistemi "Arturo Perego"), G. Giorgi. L'Elettrotecnica, vol. 8, no. 31, Nov. 15, 1921, pp. 682-683, 2 figs. Describes the Arturo Perego system of wired wireless, antenna parallel to transmission line.

EPEATERS. Three-Electrode-Lamp Repeaters in Telephony (Ripetizione Telefonia amplificata con la lampada a tre elettrodi, G. Marchesi. Telegrafi e Telefoni, vol. 2, no. 4, July-August 1921, pp. 170-177, 8 figs. Discusses single repeater or Edison system, two repeater single current or Richard system, and the four wire double circuit system. (Concluded)

TERMINALS, RAILWAY

EIGHT. New Freight Terminal for the N.Y.N.H. &. H.R.R. in Providence, R.I. Ry. Rev. vol. 69, no. 22, Nov. 26, 1921, pp. 707-711, 9 figs. Has approximate standing capacity of 4,000 cars, with yard trackage of 55 miles.

ASSENGER. On the Question of Terminal Stations for Passengers, A. S. Baldwin. Bul. Int. Ry. Assn. vol. 3, no. 10, Oct. 1921, pp. 1483-1526, 14 figs. Discusses arrangements for reducing movements of locomotives and empty rolling stock at passenger terminals; types of terminals: stub,through, loop and combinations; their capacity, track curvatures, etc. Appendix.

TEXTILE MILLS

ECTRICITY IN. Electricity in Textile Mills. Elec. Jl. vol. 18, no. 11, Nov. 1921, pp. 486-517, 53 figs. The Central Station and the Textile Mill by F. S. Root; Modernized Plant of Prudential Worsted Co. by J. B. Parks; The Textile Industry in the South John Gelzer; The Design of Induction Motors for Textile Service, O. C. Schoenfeld; Individual Motor Drive for Spinning and Twister Frames, George Wrigley; Motors for Textile Finishing Plants, Warren B. Lewis; Central Station Power for Textile Mills, John H. Fox; Adjustable Speed Motors and Control in Finishing Plants, C. W. Babcock, Silk Throwing and Electric Drive, C. T. Guilford; Day and Night Lighting in Textile Mills, Samuel G. Hibben.

TIDAL POWER

STALLATIONS. Tidal Power Installations (Installations marémotrices), André Defour. L'Electricien vol. 52, no. 1287, Nov. 1, 1921, pp. 488-494, 9 figs. Describes French plant at Rotheneuf, Ille-et-Vilaine, and gives cost calculation per hp. for the different types of equipment.

ILIZATION. Using Tidal Energy (Sur l'utilisation de l'énergie des marées), A De Rouville. Revue Générale de l'Electricité, vol. 10, no. 18, Nov. 5, 1921, pp. 627-631. Reviews the question from technical and economical standpoints; favors solution by reservoirs. Note on same subject by Georges Claude; pp. 631-632.

TIMBER

STIMATING. The Jonson Absolute Form Quotient: How it is used in Timber Estimating, H. R. Wickenden. Jl. of Forestry, vol. 19, no. 6, Oct. 1921, pp. 584-593. Volume and taper of trees is determined by the ratio between two diameters on the tree. Has been in successful use in Scandinavia for ten years.

TIME STUDY

ECONOMY OF HUMAN EFFORT. Economy and Human Effort in Industry, E. Farmer. Eng. & Indus.. Management, vol 6, no. 19, Nov. 10, 1921, pp. 535-537. Deals with alternative choices, namely, unreconcilable hostility to study; approval of its present form; and scientific inquiry into its possibilities. (Abstract). Paper read before British Assn.

METALLURGICAL ANALYSIS. Time Studies in Metallurgical Analysis, W. F. Dietrich. Min. & Sci. Press, vol. 123, no. 21, Nov. 19, 1921, pp. 708-710. Preliminary report on application of detailed time studies to instruction in metallurgical analysis in department of mining and metallurgy of Stanford University.

TOOL MAKING

RAW MATERIAL FOR. The Economical Size and Accurate Cost of Raw Material used in Tool Manufacture. Machinery (Lond.), vol. 19, no. 476, Nov. 10, 1921, pp. 155-159. Discusses correct diameter and length of blank, its weight, and cost per lb. of material. Gives table of weights for high-speed steels.

TRACTORS

MACHINING METHODS. Production Methods in a Tractor Works. Eng. Production, vol. 3, nos. 57 and 58, Nov. 3 and 10, 1921, pp. 421-425, and 443-446, 22 figs. Details and equipment of factory recently laid out by Wallace (Glasgow), Ltd., for manufacture of the Glasgow tractor. Details of tractor and machining process.

TRANSFORMERS

220,000-VOLT. Features of 220,000-Volt Transformers Available for First Time, Walter M. Dann. Elec. World, vol. 78, no. 22, Nov. 26, 1921, pp. 1063-1066, 9 figs. Rates at 16,667 kva. each, the Pacific Gas & Electric transformers constitute largest 220,000-volt units built to date; unusual coil arrangements, insulation and departure in ventilation make them of particular interest.

TRANSPORTATION

FACTORY. The Analysis and Control of Factory Transportation, F. A. Pope. Factory, vol. 27, no. 6, Dec. 1921, pp. 747-751, 6 figs. Describes plan providing both for internal transportation service and that of road trucks in outside work.

TUNNELS

DRIVING FLOOD-PROTECTION. Driving a 20,000 Sec. Ft. Flood Protection Tunnel. Eng. News-Rec., vol. 87, no. 22, Dec. 1, 1921, pp. 882-886, 7 figs. Turkey Creek diversion works at Kansas City includes 28 by 28-ft. tunnel through bedrock requiring grade change. Shovels are driven. Machine-mixed concrete placed by air.

LINING RAILWAY. Lining Railway Tunnels Under Traffic. Contract Rec., vol. 35, no. 49, Dec. 7, 1921, pp. 1066-1071. Various schemes used by several railway companies are described. Pneumatic concreting generally adopted although hand methods are used for short tunnels. (Abstract.) Committee report before Am. Ry. Bridge & Building Assn.

WATER-BEARING STRATA, THROUGH. Method of Constructing 8 Ft. Tunnel Through Water-Bearing Strata, R. F. Baker. Eng. & Contracting, vol. 56, no. 22, Nov. 30, 1921, pp. 518-519. Describes construction of tunnel by which aqueduct of Birkenhead Corporation passes under River Dee at point nearly ¾ mile below Hawarden swing bridge on Great Central Ry. Notes on tidal influence, method of excavating, rate of tunneling, etc. (Abstract.) Paper read before Liverpool Eng. Soc.

VOCATIONAL TRAINING

GERMANY. Industrial Training and Vocational Guidance, M. Morley. Eng. & Indus. Management, vol. 6, no. 20, Nov. 17, 1921, pp. 568-569. Outlines manner in which there are being developed in Germany as basic step towards decasualization. Most interesting of German plans is said to be the organized direction of workers from overcrowded or decaying industries to industries where their services are in demand.

W

FRENCH AND AMERICAN METHODS. Modern Theory of Salary (La théorie du salaire moderne), F. Bayle. La Technique Moderne, vol. 13, no. 5, May 1921, pp. 218-220. Discusses American and French methods and how they are arrived at.

REDUCTION, EFFECT OF. Cutting Wages the Sure Way to Retard Business Resumption, E. W. Hulet. Am. Mach., vol. 55, no. 23, Dec. 8, 1921, pp. 930-931. Study of business conditions for forty years. It is claimed that careful management makes high wages better for all.

Systems, Comparison of. Time, Piece-Rate and Premium Wage Systems (Zeitlohn, Stücklohn und Prämiensystem), H. Frydrychowics. Schiffbau, vol. 23, nos. 4-5, Oct. 26-Nov. 2, 1921, pp. 105-110, 3 figs. Discusses advantages and disadvantages of different systems in shipyards and recommends a new system.

WASTE UTILIZATION

Western Electric Co.'s Practice. More Dollars from Salvaged Material. Factory, vol. 27, no. 6, Dec. 1921, pp. 766-767, 3 figs. Describes how Western Elec. Co. saves $60,000 a year by changing its waste into by-products.

WASTES

Industrial, Salvaging. Salvaging Industrial Wastes, J. A. Smith. Mech. Eng., vol. 43, no. 12, Dec. 1921, pp. 797-798. Notes on salvage work in metal wastes and in maintenance and repairs.

WATER GAS

Blue. Investigating into the Manufacture of Blue Water Gas. Gas World, vol. 75, no. 1943, Oct. 15, 1921, pp. 321-322. Sixth report of Gas Investigation Committee discussing investigation of the manufacture in an outside generator; Uddington tests and lim ts of steaming; methods of diminishing heat losses; etc.

WATER METERS

Standardization. The Standardization of Water Meters — Disk Type, R. K. Blanchard. Jl. Am. Water Works Assn., vol. 8, no. 6, Nov. 1921, pp. 637-643, 1 fig. Discusses standard specifications for disk meters. Notes on demand for uniform overall length of meters; uniform length and design of couplings; uniform threads on spuds of meters; standard tests and capacities for disk meters; standard flanges.

WATER POLLUTION

Protection from. Protecting Water Supplies from Pollution, Allen Hazen. Fire & Water Eng., vol. 70, no. 23, Dec. 7, 1921, pp. 1049-1050, 1064 and 1076-1077. Principal methods of guarding water supplies from injurious contamination. Importance of filtration and chlorination.

WATER PURIFICATION

Colloidal Chemistry and. Some Notes on Colloidal Chemistry and Water Purification, Milton F. Stein. Jl. Am. Water Works Assn., vol. 8, no. 6, Nov. 1921, pp. 571-582. Notes on reactions in distilled and turbid water; practical measure of turbidity; effect of excess of alkali on coagulation; color and coagulation; color removal; test for color and tannins in water.

WATER TREATMENT

Chlorination. Tastes and Odors from Chlorination, Walter A. Sperry and Lloyd C. Billings. Jl. Am. Water Works Assn., vol. 8, no. 6, Nov. 1921, pp. 603-615, 3 figs. Where plant design is not well adapted for chlorinating, tastes are likely to be result of improper feeding. Some method of controlling chlorine feed is shown to be necessary. The chlorine absorption method, as outlined by Wolman and Enslow, is said to be consistent, accurate, and practicable.

WATT-HOUR METERS

Induction. Induction Watt-hour Meters, C. S. Darling. Beama, vol. 9, no. 5, Nov. 1921, pp. 459-466, 3 figs. Watt-hour meter gives at every instant a reading which is the summing up or integration of kw-hr. consumed.

WELDING

Metallography Applied to. Principles of Metallography as Applied to the Industry of Welding, W. H. Ludington. Jl. Eng. Inst. Can., vol. 4, no. 12, Dec. 1921, pp. 611-615, 5 figs. Outline of principles of metallography as applied to electric arc, thermit and oxy-acetylene welding.

See also Electric Welding; Fusion Welding; Oxy-Acetylene Welding.

WIRE ROPE

Fracture. The Fracture of Wire in Steel Ropes, E. M. Horsburgh. Engineering, vol. 112, no. 2916, Nov. 18, 1921, pp. 707-711, 13 figs. Fundamental principles are discussed, and attempt is made to deal with some problems in steel ropes in which general agreement has not yet been reached. Results of some of writer's experimental observations on wire ropes. Paper read before British Assn.

WOOD PRESERVATION

Car Sills, etc. The Preservative Treatment of Car Lumber, H. S. Sackett. Ry. Age, vol. 71, no. 23, Dec. 3, 1921, pp. 1079-1080, 3 figs. Discusses advantages of creosoting, decking, roofing, car sills, etc., and advocates extension of this practice.

Preservative Solution. Wood Preservative Which Makes Putrescible Matter Stable, Strengthens Timber, Making It Fire Resistant, F. G. Zinsser. Coal Age, vol. 20, no. 20, Nov. 17, 1921, pp. 793-796, 2 figs. Consists of oxides of copper and of zinc, ammonia and carbolic acid; solution of copper oxide in ammonia dissolves albumin, cellulose and pectines, making new bodies which cement wood and render inconstant substances stable.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N.Y.

A

ACCIDENTS

INDUSTRIAL. The Prediction Cost of Industrial Accidents, Sanford DeHart. Am. Mach., vol. 56, no. 1, Jan. 5, 1922, pp. [illegible] figs. [illegible] on cost of accidents. Instances of reduction in [illegible] and monetary losses. Examples of simple but efficacious safety methods and appliances.

ACCOUNTING

MUNICIPAL UTILITIES. Standard Accounting for Municipally Owned Public Utilities, [illegible]. Elec. World, vol. [illegible], no. 1, Jan. 1, 1922, pp. [illegible]. States that [illegible] reports or statements of [illegible] until there is an adequate basis of comparison [illegible]. No such basis exists today. Discusses possibility of [illegible], standardizing of statements, etc.

POWER PLANTS. Power-Plant Accounts—XVI, [illegible]. Power, vol. 54, no. 26, Dec. 27, 1921, pp. 1013-1015, 2 figs. General scheme of accounts. (Concluded).

AIR COMPRESSORS

DISPLACEMENT, CODE FOR. Code for Displacement Compressors and Blowers. Mech. Eng., vol. 44, no. 1, Jan. 1922, pp. 15-18 and 70. Preliminary draft of fifth in series of 19 codes in course of preparation by A.S.M.E. [illegible] power tests codes.

MARINE DIESEL ENGINES. Design of Air Compressors for Marine Engines, David Bruce. Motorship, vol. 7, no. 1, Jan. 1922, pp. 22-24, 11 figs. Discusses compressing and cooling, single-stage and multiple-stage, compressor capacity, spring loads on compressor valves, etc.

AIRCRAFT

BRITISH. Modern British Aircraft. Flight, vol. 13, no. 45, Nov. 10, 1921, pp. 726-740, 36 figs. Deals with all the British firms at present engaged in airplane and seaplane construction.

AIRPLANE ENGINES

BRITISH. Modern British Engines. Flight, vol. 13, no. 46, Nov. 17, 1921, pp. 750-757, 21 figs. Describes all the British aero engines being manufactured at present.

REQUIREMENTS. The Aeroplane Engine, P. E. Biggar. Eng. Inst. Can. Jl., vol. 5, no. 1, Jan. 1922, pp. 15-21, 8 figs. Requirements of aircraft propulsion and their effect on engine design.

AIRPLANES

AEROFOILS. Aerodynamic Characteristics of Aerofoils—II. Nat. Advisory Committee for Aeronautics report no. 124, 1921, pp. 89-140, 165 figs. Collection of data on aerofoils made from reports of number of leading aerodynamic laboratories of United States and Europe and presented in a uniform series of charts and tables suitable for use of designing engineers and purpose of general reference. Continuation of Report no. 93.

Developments in Aircraft Design by the Use of Slotted Wings, F. Handley Page. Flight, vol. 13, nos. 51 and 52, Dec. 22 and 29, 1921, pp. 844-846 and 860-861, 17 figs. Deals with applications of slotted aerofoils. Results of tests.

COMMERCIAL OPERATION. Commercial Operation of Airplanes, L. B. Lent. Mech. Eng., vol. 44, no. 1, Jan. 1922, pp. [illegible]. Analyses of record of Air Mail Service of U. S. Post Office Dept. for year ending Sept. 30, 1921. Author points out possible improvements, most important being use of efficient commercial planes equipped with thoroughly reliable power plant. Total operating cost, it is claimed, should not exceed 70 cents per plane-mile for single-engine planes of not over 400 hp.

PRESSURE DISTRIBUTION OVER TAIL SURFACES. The Pressure Distribution over the Horizontal Tail Surfaces of an Airplane—I. Nat. Advisory Committee for Aeronautics report no. 118, 1921, 86 pp., 264 figs. Account of investigation to determine pressure distribution over two horizontal tail surfaces in uniform free flight.

The Pressure Distribution over the Horizontal Tail Surfaces of an Airplane—II. Nat. Advisory Committee for Aeronautics report no. 119, 1921, 40 pp., 85 figs. Shows that results obtained upon models [illegible] can be used to accurately predict loads upon full-sized tails and also to find distribution of load when large elevator angles are used.

AIRSHIPS

MOORING MASTS. A Portable Airship Mooring Mast. Aviation, vol. 11, no. 26, Dec. 26, 1921, p. 732, 1 fig. Describes U. S. Army Air Service mast consisting of four sections of 18 ft. each, capable of mooring ships up to 1,200,000 cu. ft. capacity.

ALLOYS

FUSIBLE. Fusible Alloys (Les Alliages fusibles), Sigma. La Métallurgie, vol. 53, no. 46, Nov. 17, 1921, pp. 2145-2147. Gives list of compositions for anti-friction metals, solders and other alloys.
[illegible]

ALUMINUM ALLOYS

ALUMINUM-IRON, ETC. Aluminum Alloys (Note complémentaire sur les alliages d'aluminium), Léon Guillet. Revue de Métallurgie, vol. 18, no. 10, Oct. 1921, pp. 681-684, 4 figs. Deals with aluminum-iron, aluminum-chromium, aluminum manganese, and aluminum-cerium.

MECHANICAL PROPERTIES. Aluminum and its Alloys—IV, F. A. Livermore. Metal Industry (Lond.), vol. 19, no. 22, Nov. 25, 1921, pp. 420-421 and 422, 1 fig. Alloys of aluminum and copper, and aluminum and zinc, and their mechanical properties and application.

MELTING. Aluminum and Its Alloys—V, Frank A. Livermore. Metal Industry (Lond.), vol. 19, no. 25, Dec. 16, 1921, pp. 496-500, 7 figs. Deals with difficulties in melting and discusses the question of pyrometric control.

AMMONIA

SYNTHESIS. The Claude Synthetic Ammonia Process, Nov. 26, 1921, pp. 665-666 and (discussion) 666-668, J. H. West. Chem. Age (Lond.), vol. 5, no. 128. Discusses catalyst vessels, catalyst material, removal of ammonia from catalyst tubes, cheap hydrogen, and industrial uses of synthetic ammonia.

ANEMOMETERS

TESTING. The Testing of Anemometers. James Cooper. Trans. Instn. Min. Engrs., vol. 62, Part 1, Nov. 1921, pp. 90-99, 9 figs. Discusses results of tests showing that anemometric measurements are unreliable, especially at the working-faces where exact knowledge is necessary. See also Min. Inst. of Scotland Trans., vol. 42, Part 2, 1921-1922, pp. 44-53, 9 figs.

APPRENTICES, TRAINING OF

PRESENT SCOPE, U. S. The Training of Workers in manufacture, J. V. L. Morris. Am. Mach., vol. 56, no. 3, Jan. 19, 1922, pp. 85-86. Present scope of apprenticeship in United States. Number of apprentices in various industries. Importance of apprentices in metalworking field.

ASH HANDLING

POWER PLANTS. Ash Handling in Large Generating Stations, L. R. Lee. Power, vol. 55, no. 3, Jan 17, 1922, pp. 86-90, 6 figs. Deals with handling and disposition of furnace ash, describes several designs of ashpits and points out merits or demerits of each. Describes different methods of ash disposal and provisions that must be made in case there is a failure in operation of ash-disposal system employed.

AUTOGENOUS WELDING

PIPE. Autogenous Pipe Welding, H. B. Iglehart, Welding Engr., vol. 6, no. 11, Nov. 1921, pp. 21-24, 16 figs. Describes tests on welded pipe construction and shows advantages of welded joints.

AUTOMOBILE ENGINES

DETONATION, MEASURING. Methods of Measuring Detonation in Engines, Thomas Midgley, Jr. and T. A. Boyd. Soc. Automotive Engrs. Jl., vol. 10, no. 1, Jan. 1922, pp. 7-11, 4 figs. Discusses various methods employed to measure detonation or fuel knock, such as the listening indicator, temperature and pouncing-pin, and describes latter method.

AUTOMOBILE FUELS

CALORIFIC VALUES. Royal Aircraft Establishments Reports, Nos. H. G. 410 and H. 861. Instn. Petroleum Technologists Jl., vol. 7, no. 28, Oct. 1921, pp. 339-351, 5 figs. Methods of determining calorific values of certain unsaturated hydrocarbons; and calorific values of petrols and of petrol fractions.

SENSIBLE FUELS. Total Sensible Heats of Engine Fuels and Their Mixtures with Air, Robert E. Wilson and Daniel P. Barnard, Soc. Automotive Engrs., Jl., vol. 10, no 1, Jan. 1922, pp. 65-68, 5 figs. Describes methods used by research laboratory of Mass. Inst. of Technology in determining total sensible heat content of Socony gasoline and kerosene and their mixtures with air at temperatures up to 500 deg. cent.

AUTOMOBILES

FRONT AXLES, MACHINING. Front Axles and Steering Knuckles, Fred H. Colvin. Am. Mach., vol. 55, no. 25, Dec. 22, 1921, pp. 1011-1013, 10 figs. Machining operations of Peerless axle. Spring actuated drilling fixtures which are quickly handled. Holding long, work for milling. Automatic lathe work on steering knuckles.

GEAR BOXES. Notes on Motor Car Gear-Boxes, H. F. L. Orcutt. Engineering, vol. 112, nos. 2920, 2921 and 2922, Dec. 16, 23 and 30, 1921, pp. 830-831, 870-872 and 897-899, 8 figs. In writer's opinion, based on over 10 years' experiences, gear boxes, generally speaking, are not well designed and are badly made. Discusses defects in design, workmanship and material, and summarizes gear-tooth requirements. Paper read before Instn. Automobile Engrs. (British.)

PAINTING AND VARNISHING. Manufacture and Application of Automobile Varnishes and Paints, L. Valentine Pulsifer. Soc. Automotive Engrs., Jl., vol. 10, no. 1, Jan. 1922, pp. 12-16. Specifies five basic materials necessary in automobile painting. Engineering systems of application and methods of application including drying and surfacing. Care of finish.

ROLLS-ROYCE WORKS. Rolls-Royce Methods. Eng. Production, vol. 3, nos. 63, 64 and 65, Dec. 15, 22 and 29, 1921, pp. 565-569, 580-596 and 613-618, 44 figs. [illegible] production methods.

SERVICE METHODS. Automotive Service Methods and Equipment Howard Campbell. Am. Mach., vol 55, no. 26, Dec. 29, 1921 pp. 1026-1028, 10 figs., and [illegible] 8 figs. Servicing the Rolls-Royce. [illegible] truck service methods and tools Servicing the Mack truck. Operations in a New York taxicab station.

B

BEAMS

[illegible] Beams of the Grey Type at the Differ-[illegible] à larges ailes du type Grey, aux [illegible] J. Audigé, Le Génie Civil, vol. 79, no. [illegible] Grey profiles; [illegible] flange beams.

CONTINUOUS. Calculation of Continuous Beams (Le calcul des portiques continus), L. Descans. Le Génie Civil, vol. 79, nos. 21 and 22, Nov. 19 and 26, 1921, pp. 439-443, and 461-464, 12 figs. Nov. 19: Discusses characteristics of continuous beams, calculation of loads, etc. Nov. 26: Analytical formulas.

DEFLECTION. Deflections of Beams by the Conjugate Beam Method, H. M. Westergaard. Jl. Western Soc. of Engrs., vol. 26, no. 11, Nov. 1921, pp. 369-396, 28 figs. Discusses standard methods, statically determinate beams, and statically indeterminate beams.

BELTING

LEATHER. Problems In Connection with Leather Belting, J. Edgar Rhoads. Can. Machy., vol. 26, no. 25, Dec. 22, 1921, pp. 24-25. Use of roller and ball bearings; common causes of trouble; humidity and its effect.

RECLAIMED LEATHER. Reclaimed Leather Belting. Machy. (N.Y.), vol. 28, no 5, Jan. 1922, pp. 363-365, 6 figs. Use of salvaged leather belts reinforced with woven cotton fabric. Processes employed by Syracuse Belting Co., in manufacture of reclaimed belting.

BENDING MACHINES

CUP-LEATHER SLEEVE FRICTION. Friction of cup-Leather Sleeves, Eugen Irlon. Mech. Eng., vol. 44, no. 1, Jan, 1922, pp. 59-60, 2 figs. Presents data of tests of friction carried out in a 75-ton hydraulic bending machine water-driven by a three-piston electric pump. Translated from Zeit. des Vereines deutscher Ingenieure, vol. 65, no. 39, Sept. 24, 1921, pp. 1016-1017.

BITUMEN

EXTRACTION FROM TAR SANDS. Extraction of Bitumen from the Tar Sands of Northern Alberta, K. A. Clark. Contract Rec., vol. 35, no. 51, Dec. 21, 1921, pp. 1107-1108. Important relation of problem to road building. Study of separation process undertaken by Industrial Research Dept. of University of Alberta.

BLIND

EMPLOYMENT. Employment of War-Blinded in German Industries, Hubert Hermanns Am. Mach., vol. 55, no. 26, Dec. 29, 1921, pp. 1921, pp. 1023-1025, 6 figs. Methods used to enable blind ex-soldiers to live independent of charity. Machine operation in manufacturing plants.

BOILER FEEDWATER

DISTILLED. Distilled Water for Boiler Feed at River Rouge Plant. Power, vol. 54, no. 26, Dec. 27, 1921, pp. 998-1003, 10 figs. Elaborate two-effect high-heat-level evaporator system furnishes distilled makeup to an amount up to 25 per cent of boiler feed.

SOFTENING. Softening and De-oxygenation of Boiler Feed Water. Chem. Age (Lond.), vol. 5, 130, Dec. 10, 1921, pp. 726-728. Discusses comparative merits of water-softening systems, importance of effecting oxygen removal, and chemical and physical methods for performing de-oxygenation.

BOILER OPERATION

EFFICIENT. Better Boiler Room Operation, C. W. DeForest Combustion, vol. 5, no. 6, Dec. 1921, pp. 246-248 and 260. Discusses investment cost; cost of fuel; and organization, personnel, supplies and maintenance costs. Paper read before Stoker Manufacturers Assn.

BOILER PLANTS

MANAGEMENT. Boiler House Management, David Brownlie. Proc. South Wales Inst. Engrs., vol. 37, no. 5, Nov. 10, 1921, pp. 405-438. Types of boilers and their relative advantages and disadvantages; mechanical stoking; economizers and feedwater heaters; superheaters; forced and induced draft; auxiliary machinery.

BOILER ROOMS

AIR SUPPLY. The Air Supply to Boiler Rooms, Richard W. Allen. Eng. & Indus. Management, (Cassier's Marine No.), Dec. 1921, pp. 35-42, 9 figs. One of most important points is that there should be equal distribution of preheated air to furnaces, so that no currents are set up and each furnace receives equal supply of air. Author deals with this problem. Results of trials taken under same conditions on one class of ship over period of four years show gains effected in each year as experience is accumulated.

BOILERS

DESIGN. Boiler Design and Other Fuel Efficiency Factors, F. G. Lister. Ry. Rev., vol. 70, no. 1, Jan. 7, 1922, pp. 5-8, 4 figs. Discusses fuel efficiency of locomotives by attention to mechanical details. Longer combustion chambers; flexible staybolts; tight front ends; floating bushings; automatic stokers; etc

BORING MACHINES

STANDARDIZATION. Standardization and Assimilation — II, H. Varley. Eng. & Indus. Management, vol. 6, no. 23, Dec. 8, 1921, pp. (650-652, 1 fig. A scheme of standardized boring practice.

BRIDGES, HIGHWAY

Batiscan River, Quebec. Batiscan Bridge [illegible] Montreal and Quebec. F. B. Panhaud. [illegible] 11, 1922, pp. 25-27, 6 figs. Seven-span steel structure, 1211 ft. long; bascule span is of Strauss patent type, motive power being [illegible] gasoline engine.

BRIDGES, LIFT

Bascule, Chicago. Wells Street Bridge Construction, R. F. Ituler[illegible]. Eng. World, vol. 20, no. 1, Jan. 1922, pp. 1-8, 12 figs. Describes Chicago's new double-leaf, double-deck, trunnion bascule bridge in course of construction.

BRIDGES, RAILWAY

Steel, Specifications for. Tentative Specifications for Steel Railway Bridges. Proc. Am. Soc. Civ. Engrs., vol. 47, no. 10, Dec. 1921, pp. 683-731, 15 figs. Progress report of special committee on specifications for bridge design and construction, followed by discussion.

BUILDING CONSTRUCTION

Mail Terminal, Chicago. Structural Design of U.S. Mail Terminal at Chicago. Eng. News-Rec., vol. 87, no. 25, Dec. 22, 1921, pp. 1010-1013, 8 figs. Steel 150-ft. truss in wall; girders for offset columns; provisions for future changes; ring frames at mail chutes; foundation cantilevers.

Steel Framing. Erection of Steel Building and 150-ft. Truss, W. J. Howard. Eng. News-Rec., vol. 87, no. 26, Dec. 29, 1921, pp. 1058-1060, 3 fig. Special methods for huge truss. Derrick on first floor with long boom places framing for six stories and roof.

BUILDINGS

Moving. The Moving of Brick Buildings. Engineering, vol. 112, no. 2921, Dec. 23, 1921, pp. 842-844, 10 figs. Describes two jobs recently completed by John Eichleay, Jr., Co., Pittsburg, Pa., namely, moving of a brick church in Pittsburgh 20 ft. back from its original position, and a steel frame building of eight stories a distance of 40 ft.

C

CABLES, ELECTRIC

Dry Core Paper. The Manufacture of Dry Core Paper Cable, Ikutaro Fukui. Inst. Elec. Engrs. of Japan, Jl (Denki Gakkwai Zasshi), no. 401, Dec. 1921, pp. 929-948. Describes various kinds of dry core paper cables and manufacturing processes connected therewith, and gives table of general dimensions and shapes of materials used in their manufacture. (in Japanese).

Faults, Localization of. Locating Faults in Armored Cable (Localisation des défauts sur les cables armés), L. Le Paige. Revue Universelle des Mines, vol. II, no. 4, Nov. 15, 1921, pp. 416-422, 3 figs. Discusses procedure in various failures of single and multiple conductor cables.

CAR LIGHTING

Methods. Railway Car Lighting (L'éclairage des voitures de chemins de fer), M. Bougrier. L'Electricien, vol. 52, nos. 1287 and 1288, Nov. 1, and 15, 1921, pp. 481-488 and 505-513, 11 figs. Nov. 1. Describes the various methods in use in different countries including lighting by candle, oil, gas, acetylene, and electricity, and gives cost data. Nov. 15: Describes the Brown-Boveri individual electric equipment, its operation and upkeep.

CAR WHEELS

Foundry. A Unique Foundry for Production of Car Wheels. Can. Foundryman, vol. 12, no. 11, Nov. 1921, pp. 17-20, 6 figs. Molds are placed on semi-automatic moving platform and taken to place of pouring; shaking out and annealing with very little effort.

Tires, Sorbitic Steel. Sorbitic Steel for Tires. Engineer, vol. 132, no. 3442, Dec. 16, 1921, p. 636, 4 figs. on p. 657. Includes tables showing results of tests made with three railway and three tramway tires, one of each set being treated by the Sandberg Sorbitic steel process. Results show that process is successful in obtaining improved ultimate tensile strength and hardness of tires.

CARS

Connectors. The Development of the Robinson Connector. Ry. Age, vol. 71, no. 26, Dec. 24, 1921, pp. 1253-1253, 9 figs. Detailed description of new design incorporating a number of improvements.

CARS, COAL

Electric Tippers. Electrically Equipped Railway Truck Tippers, E. H. Rousham. Electrician, vol. 87, no. 2276, Dec. 30, 1921, pp. 822-825, 10 figs. Describes the Babcock & Wilcox tipping ram, and the tipper manufactured by Ed. Bennis & Co. Ltd.; also overhead which type, hydraulic tipping rams, electric rotary tipplers, clamping methods, automatic clamping gear, etc.

CARS, FREIGHT

Wood Construction. The Use of Wood in Freight Car Construction, H. S. Saskett. Ry. Mech. Engr., vol. 96, no. 1, Jan. 1922, pp. 27-32, 6 figs. Advantages of composite design as against all-steel construction; relative advantages of double and single sheathed box car; composite gondola car; refrigerator car.

CARS, PASSENGER

Electric Railway. New Stock For Tynemouth Electrified Branches, North Eastern Railway. Ry. Gaz., vol. 35, no. 24, Dec. 9, 1921, pp. 877-884, 12 figs. Passenger vehicles of improved design built for this important electrified passenger service.

Sleeping. New Sleeping Cars for the Canadian Pacific. Ry. Age, vol. 71, no. 27, Dec. 31, 1921, pp. 1301-1394, 7 figs. Composite cars of 12 section and compartment types have special facilities for comfort of passengers.

CASE-HARDENING

Iron and Steel. Case Carburizing of Iron and Steel (Härtung von Eisen und stahl), Willy Hacker. Metall-Technik, vol. 47, no. 14, Sept. 15, 1921, pp. 85-87. Review of development and processes during last few years.

CASTING

Metal Molds. Casting in Metal Moulds, S. A. E. Wells. Metal Industry (Lond.), vol. 19, no. 25, Dec. 16, 1921, pp. 501-502. Discusses the three classes, viz., (1) that in which metal flows into mold under force of its own weight, (2) die castings, and (3) part chills in ordinary sand molds. From paper read before joint meeting of Inst. of Metals and Instn. British Foundrymen

Permanent Molds. Permanent Moulds, Edward D. Gleason. Metal Industry (Lond.), vol. 19, no. 20, Nov. 11, 1921, pp. 377-379. Description of methods of making plaster molds for finished castings to eliminate machining operations.

CELLULOID

Manufacture. Manufacture of Pyroxylin Plastics, J. R. DuPont. Chem. & Met. Eng., vol. 26, no. 2, Jan. 11, 1922, pp. 65-70, 6 figs. Properties of celluloid; methods of mixing cellulose nitrate with camphor and alcohol; stabilizing; filtering; rolling; baking; sheeting; polishing; etc.

CHROME STEEL

Ball-Bearing. The Manufacture of Chromium Ball-Bearing Steel in the Heroult Furnace, F. T. Sisco. Chem. & Met. Eng., vol. 26, no. 2, Jan. 11, pp. 71-76, 2 figs. Description of melting and processing of electric ball-bearing steel, with a view of the most serious defects in this class of material. Recommended practice for elimination and control of these defects.

Chrome-Molybdenum. Chrome-Molybdenum-Steel Applications from the Consumer's Viewpoint, C. N. Dawe. Soc. Automotive Engrs. Jl., vol. 10, no. 1, Jan. 1922, pp. 47-50 and 62, 2 figs. Gives results of physical tests, comparing medium-carbon, chrome-molybdenum, chrome-vanadium, chrome-nickel and chrome steels. Discusses case-hardening grades of Steel.

CITY PLANNING

Topographical Maps. The Advantages of a Topographical Map in City Planning, Jefferson C. Grinnalds. Good Roads, vol. 61, no. 22, Nov. 30, 1921, pp. 243-245, 250 and 252. Discusses kind of map necessary, steps in planning, new territory to be laid out and old city replanned, etc. Describes maps of Baltimore began by Topographical Survey Commission in 1894, which is said to be ideal. See also Mun. & County Eng., vol. 61, no. 6, Dec. 1921, pp. 221-225. Paper read before Am. Soc. Mun. Improvements.

COAL

Low-Temperature Carbonization. Carbonization at Low Temperature, J. D. Davis. Gas. Age-Rec., vol. 48, no. 19, Nov. 26, 1921, pp. 707-711, 1 fig. Discusses what is meant by low-temperature carbonization, its products and their uses, suitable coals, retorts, etc. See also Colliery Guardian, vol. 122, no. 3179, Dec. 2, 1921, pp. 1533-1534 and Can. Min. Jl., vol. 42, no. 47, Nov. 25, 1921, pp. 926-929.

Low-Temperature Carbonization in England, David Brownlie. Chem & Met. Eng., vol. 26, no. 1, Jan. 4, 1922, pp. 23-27, 9 figs. Survey of British practice and detailed description of construction and operation of experimental Plant of Low-Temperature Carbonization, Ltd., at Barugh, near Barnsley.

COAL HANDLING

Equipment. Springdale Mine Furnishes Fuel to West Penn Power Co. Plant, Cleaning Every Car of Coal Before Weighing, D. J. Baker. Coal Age, vol. 20, no. 25, Dec. 22, 1921, pp. 993-999, 6 figs. Power plant situated next to headframe. For weighing, coal is screened to lump, nut and slack before picking; nut and slack are united and reassembled; lump is then crushed and with nut and slack goes to boilers.

COAL STORAGE

Concrete Bins and Pits. Economy of Concrete Bins and Pits for Coal Storage, A. C. Irwin. Elec. Rev. (Chicago), vol. 79, no. 22, Nov. 26, 1921, pp. 811-816, 16 figs. Storage requirements and methods, including submerged pits; effect of storage on properties of coal; spontaneous combustion.

COKE OVENS

Beehive. Beehive Coke Ovens with Central Generator in Smaller Gas Works ([illegible] Kleinersen Gaswerken. H. Kleinholz Gas- u. Wasserfach, vol. 64, no. 38, Sept. 17, 1921, pp. 619-623, 8 figs. Describes vertical beehive ovens constructed by C. Otto & Co. for gas works of German town. Notes on phenomena occurring with coking; water-gas production in chamber furnace; heating, operation, etc.

By-Products. By-Product Coke Ovens in the Gas Industry, B. W. Winship. Am. Gas Jl., vol. 115, no. 25, Dec. 17, 1921, pp. 535-541, 7 figs. Discusses operation of coke ovens from the standpoint of meeting the seasonal demands of the [illegible].

Silica Brick. Silica Brick Coke-Ovens, A. H. Middleton. Gas Jl., vol. 156, no. 3055, Nov. 30, 1921, pp. 630-631. The advantages of using silica brick in place of quartzite for construction of coke-oven walls are (1) greater output and greater thermal efficiency, (2) greater durability, (3) resistance to corrosion where salty coal is used, and (4) possibility of varying heat treatment. Paper read before Coke-Oven Managers' Assn.

COMPRESSED AIR

Handling Material by. Handling Material by Compressed Air, F. A. McLean Can. Machy., vol. 26, no. 25, Dec. 22, 1921, pp. 19-23, 10 figs. Time is saved and economy effected. Notes on single acting air hoist, capacities of straight lift hoists, and operating costs.

Intercooling. Value of Intercooling Compressed Air, C. K. Bennett. Nat. Engr., vol. 25, no. 12, Dec. 1921, pp. 613-616, 6 figs. Advantages of intercooling. How saving in power is effected and safety maintained.

CONCRETE

Hydrated Lime in Paving. Advantages of Hydrated Lime in Paving Concrete, Tyrrell B. Schertzer. Can. Engr., vol. 42, no. 1, Jan. 3, 1922, pp. 111-112. It is said to have water-tightening properties, to increase density of concrete, and make placing easier.

CONCRETE CONSTRUCTION, REINFORCED

Railways. Reinforced-Concrete Constructions on Railways, W. W. Grierson. Engineer, vol. 132, no. 3441, Dec. 9, 1921, pp. 628-629, 10 figs. Deals with use of reinforced concrete in smaller constructions, particularly those employed by the signal and telegraph engineer, including telegraph and signal posts, gate posts, etc.

CONCRETING

Freezing Weather. Concreting in Freezing Weather. Contract Rec., vol. 36, no. 2, Jan. 11, 1922, pp. 30-32, 3 figs. Some precautions that practical experience has determined as necessary for successful construction during winter season.

CONTRACTS

Uniform Construction. Uniform Construction Contracts. Contract Rec., vol. 36, no. 1, Jan. 4, 1922, pp. 10-12. Recent conference formulates plans to standardize documents relating to contracting. Investigation discloses over 200 forms in common use.

CONVEYORS

Machinery for Elevators and. Conveying and Elevating Machinery, Gardiner Mitchell. Engineering, vol. 112, no. 2921, Dec. 23, 1921, pp. 866-870, 17 figs. Deals with the various types of conveyors and elevators, and includes tables giving standard details and particulars and standard elevator chains.

Steel Bands. The Use of Steel Bands for Power Transmitting and Conveying Purposes, Bernard Kruger. Jl. Western Soc. of Engrs., vol. 26, no. 12, Dec. 1921, pp. 428-432. Discusses increased use of steel bands, avoiding breaks in band, composition and tensile strength of bands, and compares leather, rope, chain and steel band systems.

COPPER

Working [illegible]. Experiments in the Working and Annealing of Copper. [illegible] vol. 112, no. 2922, Dec. 30, 1921, pp. 899-901, 7 figs. Results of rolling and hardness tests and specific gravity tests. Notes [illegible] of impurities on effective annealing temperature of cold-drawn copper. (Abstract.) Paper read before Inst. [illegible]

CORROSION

[illegible], D. M. Strickland. Sci. Am., vol [illegible] Some of controlling factors, and how account is best taken of them.

[illegible]ING

[illegible], F. A. Lacey. Management Eng., vol. 2, no. 1, Jan. 1922, pp. 25-28, 4 figs. How it can be measured through idleness. Shows examples of Gantt idleness charts.

Foundry. Foundry Costs and Establishment Charges, Daniel Adamson. Engineering, vol. 112, no. 2922, Dec. 30, 1921, pp. 894-895. Author endeavours to arrive at a reliable method of estimating cost of many varieties of castings in green sand, dry sand or loam, that are produced in foundry attached to a general engineering business. Notes introducing discussion before Manchester Assn. Engrs.

CRANES

Hooks for, Strength of. The Strength of a Hook or "Clivvy", Charles D. Mottram. Quarry & Surveyors' & Contractors' Jl., vol. 26, no. 297, Nov. 1921, pp. 447-449, 4 figs. Discusses safety load and factor of safety; gives curves and formulas.

Overhead Drives. Overhead Crane Drives, A. W. Knight. Machinery (Lond.), vol. 19, no. 482, Dec. 22, 1921, pp. 352-354, 4 figs. Describes some typical cranes and works out amount of movement of one side of crane in advance to the other, when the crab and its suspended load is at opposite end to drive on cross shaft.

Shifting Gear on Gantry. Use Shifting Gear on German Cranes. Iron Trade Rev., vol. 70, no. 2, Jan. 12, 1922, pp. 140-142, 5 figs. Describes gantry cranes equipped with swivel trucks and lifting jacks by means of which whole crane may be quickly and readily transferred from one runway to another. Built by Fried. Krupp Corp., Magdeburg-Buckau.

CRANKSHAFTS

Manufacture. The Manufacture of Crankshafts Engineering, vol. 112, nos. 2919 and 2920, Dec. 9 and 16, 1921, pp. 777-778, 9 figs., partly on supp. plate, and pp. 811-813, 14 figs. Describes works and manufacturing methods of Clarke's Crank & Forge Co., Ltd., Lincoln, England.

D

DIES

Continuous Rolling. Continuous Die Rolling, G. R. Norton. Soc. Automotive Engrs. Jl., vol. 10, no. 1, Jan. 1922, pp. 43-46, 11 figs. Describes process of continuous die rolling; improvements made; physical characteristics of steels; cost of operation; equipment used; etc. See also Iron Age, vol. 109, no. 3, Jan. 19, 1922, pp. 207-209, 11 figs.

DIESEL ENGINES

Air Compressors. *See Air Compressors, Marine Diesel Engines.*

DRAINAGE

Pumping Plants. Drainage Pumping Plants, L. C. Craig. Mun. and County Eng., vol. 61, no. 6, Dec. 1921, pp. 215-219. Points out necessity for pumping for large percentage of swamp and overflowed lands in United States; discusses size of pumping plant, type of engine and pump to use, electric pumping, and use of Diesel engines for drainage pumping plants. Paper read before Nat. Drainage Congress.

DRILLING MACHINES

Heavy-Duty. Economy of Heavy-duty Drilling, Fred R. Daniels. Machy. (N.Y.) vol. 28, no. 5, Jan. 1922, pp. 349-355, 16 figs. Examples of work for which heavy duty drilling machine is adapted.

DROP FORGINGS

Heat Treatment. Heat-treatment of Drop-forgings. Machy. (N.Y.), vol. 28, no. 5, Jan. 1922, pp. 384-388, 6 figs. Furnaces design and fuels suitable for treating drop forgings.

DUST

Collectors. Mechanical Methods of Allaying Dust, P. H. Warren. Australasian Inst. Min. & Metallurgy Proc., no. 42, June 30, 1921, pp. 31-47 and (discussion) 47-100, 10 figs. Describes tests carried out at Borken Hill South mine with the Clifton dust, collector.

E

EDUCATION, ENGINEERING

Industrial Needs. Engineering Education. Mech. Eng., vol. 44, no. 1, Jan. 1922, pp. 1-7 and 42. Group of papers in which are presented particular needs of industries and problems that confront engineering faculties: Professional Engineering Education for the Industries, Francis C. Pratt. A National Policy on Engineering Education, A. G. Christie. Engineering Education as Viewed by the Industrialist, J. E. Otterson.

ELECTRIC CIRCUITS, D.C.

Voltage Drop. How to find Voltage-Drop in Electric Circuits, Edgar P. Slack. Power, vol. 54, no. 26, Dec. 27, 1921, pp. 1009-1011, 1 fig. Chart from which line drop, length of circuit, currents values and size of conductors can be determined without calculation

ELECTRIC FURNACES

[illegible] Iron Age, vol. 109, no. 1, Jan. 5, 1922, pp. 17-19 How to avoid delays in each of the eight major operations of making steel in furnaces having movable electrodes.

Basic. Basic Electric Furnace for Cast Iron. Can. Foundryman, vol. 12, no. 11, Nov. 1921, pp. 32-34. Important characteristics of refining in the basic-hearth electric furnace are: (1)it is strongly reducing, (2) it is degasifying to an appreciable extent, (3) it is cleansing of entrained slags and oxides, and [illegible]

Forging. Builds Electric Forging Furnace, G. M. Little. Iron Trade Rev., vol. 69, no. 26, Dec. 29, 1921, pp. 1689-1692, 3 figs. Discusses difficulties encountered in construction of carbon resister-type furnace for heat treating and forging work. Gas or oil used to prevent resister oxidation. Insulation problem solved.

Gray-Iron. Practical Aspects of Electric Gray Iron, C. H. Vom Baur. Iron Age, vol. 109, no. 1, Jan. 5, 1922, pp. 51-52. Advantages over the cupola. Actual results from heats made recently. Effect of nickel and chromium. Compara- [illegible]

Induction. Melting Steel in an Induction Furnace, H. A. Winne. Iron Trade Rev., vol. 70, no. 2, Jan. 12, 1922, pp. 138-139, 2 figs. Describes induction furnace of 4000-lb. hearth capacity in successful operation at Pittsfield works of Gen. Elec. Co. for more than a year. It is a single-phase, single-ring (horizontal) type; lining consists of two essential parts, an outer layer of insulating and refractory brick, and inner rammed lining, or hearth proper.

Railway Shops. The Electric Furnace on Railroad Work, Larry J. Barton. Western Machy. World, vol. 12, no. 11, Nov. 1921, pp. 444-446, 4 figs. Describes installation of Southern Pacific Co., at their Sacramento shops; 6-ton Heroult furnace.

Reactance Requirements. Furnace Reactance Requirements Need Consideration, P. B. Short. Elec. World, vol. 79, no. 2, Jan. 14, 1922, pp. 81-82, 4 figs. Discusses growing tendency to use higher operating voltages and the importance which public utilities are attaching to power factor.

ELECTRIC LOCOMOTIVES

Paulista Railway, D.C. 3000 Volt Direct-Current Locomotives for the Paulista Railways, John A. Clarke, Jr., Elec. Jl., vol. 19, no. 1, Jan. 1922, pp. 17-23, 11 figs. Discusses electrification of Jundiahy-Campinas section of the Sao Paulo state railway, and gives data on passenger and freight locomotives. and auxiliaries..

Storage-Battery. Data on Operation of Storage Battery Locomotive, Jerome C. White. Coal Industry, vol. 4, no. 12, Dec. 1921, pp. 581-583, 2 figs. Costs and operating data obtained from a storage-battery locomotive used as a main haulage machine. Paper read before Coal Min. Inst. of Am.

Explosion Proof Electric Mine Locomotives, L. C. Illsley. Coal Industry, vol. 4, no. 12, Dec. 1921, pp. 588-591, 9 figs. Description of work being carr ed on by Bur. of Mines in connection with investigations of storage-battery locomotives; requirements for approved equipment; rules for inspection.

ELECTRIC MOTORS, A.C.

Nomogram for Induction. Induction Motor Nomogram, R. G. Warner. Jl. Am. Inst. Elec. Engrs., vol. 40, no. 10, Oct. 1921, pp. 808-814, 7 figs. Movable diagram for reading all performance characteristics of any three-phase induction motor.

Single-Phase Induction. Current Locus of Single-Phase Induction Motors, J. K. Kostko. Am. Inst. Elec. Engrs., Jl., vol. 41, no. 1, Jan. 1922, pp. 30-36, 7 figs. Deals with problem od determination of performance and constants of an existing motor on basis of a few simple tests. Problem is dealt with by method which is believed to combine accuracy with comparative simplicity of final results.

Synchronous Induction. Induction-Type Synchronous Motors, Laurence H. A. Carr. Engineer, vol. 132, no. 3444, Dec. 30, 1921, pp. 713-714, 3 figs. Discusses theory and compares them with other types of machines. Notes on construction, starting and synchronizing, peculiarities of single-phase rotors, reliability, excitation voltage, control and switchgear, efficiency, price, etc. (Abstract.) Paper read before Instn. Elec. Engrs. (British.)

ELECTRIC PLANTS

Automatic. Automatic Plant Permits Development of Small Power Site, C. M. Gilt. Elec. World, vol. 78, no. 25, Dec. 17, 1921, pp. 1213-1214, 3 figs. Generator started simply by energizing line connecting automatic plant to main station..

Commonwealth Edison Co., Chicago. Calumet Station of the Commonwealth Edison Co., A. D. Bailey. J. Western Soc. of Engrs., vol. 26, no. 12, Dec. 1921, pp. 420-427, 9 figs. Discusses station now under construction, with ultimate capacity of 180,000 kw.; present installation consists of one 30,000-kw. Westinghouse Tandem compound unit and one 30,000-kw. General Electric unit. Boiler station to consist of seven 1,500-hp. Babcock & Wilcox boilers fired with forced-draft chain-grate stokers and augmented with superheaters and steel-tube economizers.

Hartford Electric Light Co. Station Electrical Layout for Supplying Local and Regional Service Elec. World, vol. 78, no. 26, Dec. 24, 1921, pp. 1269-1273, 9 figs. Flexibility and simplicity of design effectively combined in South Meadow station of Hartford Elec. Light Co. Symmetrical development by sections to meet dual service.

Possible Economies. Possible Economies in Large Electric Generating Stations, Emile Rauber. Engineer, vol. 132, no. 3444, Dec. 30, 1921, pp. 669-670. States that considerable progress may still be made in economizing fuel by (1) using higher steam pressures; (2) employing higher degree of superheat; (3) heating feedwater by "bleeding" turbines; and (4) preventing all losses of heat. (Abstract). Report of Commission appointed by French Minister of Pub. Works, printed in Journal Officiel.

ELECTRIC TRANSMISSION LINES

Overhead Grounded Wire. Questions on the Economic Value of the Overhead Grounded Wire, E. E. F. Creighton. Am. Inst. Elec. Engrs. Jl. Vol. 41, no. 1, Jan. 1922, pp. 21-29, 1 fig. Definite conclusion is drawn that expense of overhead wires on wooden pole lines is, in general, an economic waste. In particular cases it may be justified. On metal tower construction, use of overhead grounded wire is, in general, fully justifiable. Gives analyses made for presentation to a public service commission. Bibliography.

Protection. Protection of Transmission Lines With Condensers, George Lewis. Elec. Rev. (Chicago), vol. 79, nos. 19 and 29, Nov. 5 and 19, 1921, pp. 691-694 and 765-769, 14 figs. High-frequency disturbances and high-voltage surges relieved as result of satisfactory performance of static condensers; influences of short-circuit eliminated in test on heavy line.

ELECTRIC WELDING, ARC

Boiler Repairs. Electric Arc Welding for Boiler Repairs. Ry. Elec. Engr., vol. 12, no. 11, Nov. 1921, pp. 415-420, 19 figs. Special committee of Master Boiler Makers' Assn. reports best methods of reconditioning boilers.

Cyc-Arc Process. The "Cyc-Arc" Process of Automatic Electric Welding, L. J. Steele and H. Martin. Electrician, vol. 87, no. 2273, Dec. 9, 1921, pp. 734-735. Discusses development; and the three essential variables, viz., (A) amount of current through the arc, (b) length of arc upon striking, and (c) length of time it had to be maintained before making the weld. Results of welding experiments and tests with the cyc-arc apparatus.

ELECTRIC WELDING, RESISTANCE

Methods and Apparatus. Electric Resistance Welding (La soudure électrique par résistance), R. Verdier, La Nature, no. 2480, Oct. 15, 1921, pp. 246-251, 7 figs. Describes the three methods and apparatus used.

ELECTRICITY SUPPLY

Rates Rates for Electrical Energy and Service, F. W. C. Bailey. Jl. Am. Inst. Elec. Engrs., vol. 40 no. 10 Oct. 1921, pp. 803- 808, 6 figs. Notes on straight line step, and block meter rate as flat Wright. and Hopkinson demand rates. Points out that a general or large power rate schedule should be based upon and conform to load-factor cost curve.

ENAMELING

Cast Iron and Steel. Enameling Cast Iron and Steel Materials, F. L. Prentiss Iron Age, vol. 109, no. 1, Jan. 5, 1922, pp. 13-16, 9 figs. Methods and apparatus used. Care needed in preparing surfaces for treatment. Burning on the enamel.

ENGINEERS

License Law, N. Y. State. The New York State License Law, S. G. George. Cornell Civil Engr., vol. 30, no. 4, Jan. 1922, pp. 53-54. Professional engineers and land surveyors required to obtain licenses to practice in New York State from May 5, 1923.

ENGINEHOUSES

Interior Turntable. Rectangular Enginehouse with Interior Turntable. Eng. News-Rec., vol. 87, no. 26, Dec. 29, 1921, pp. 1064-1066, 4 figs. Two Canadian railways adopt novel plan to reduce winter trouble at terminal by putting turntable under cover.

F

FACTORIES

Layout. Factory Lay-out as an Aid in Reducing Costs. Machinery (Lond.), vol 19, no. 480, Dec. 8, 1921, pp 293-296, 8 figs. Describes new plant of Colburn Machine Tool Co. Cleveland Ohio, which has been laid out with a view to economy in manufacturing.

Laying Out a Factory for Production Work, Frank W. Curtis, Am. Mach., vol. 56, nos. 2 and 3, Jan. 12 and 19, 1922, pp. 56-58 and 97-99, 8 figs. How kind and amount of equipment are estimated. Arranging machines. Uses of operation sheets, equipment records, and conveyors.

TELEPHONE. Methods in a Telephone Factory. Eng Production, vol. 3 no 64, Dec. 22, 1912, pp. 583-587, 14 figs. Describes works and practice of British L. M. Ericsson Mfg. Co., Ltd., at Beeston for manufacture od telephones, telephone exchange and private branch switchboards and allied apparatus cabinet work, etc.

FACTORY MANAGEMENT

See Industrial Management.

FILING SYSTEMS

Z CHARTS. Filing the Z Chart, Arthur R. Burnet. Management Eng., vol. 2, no. 1, Jan. 1922, pp. 47-50, 2 figs. Describes system of filing which it is claimed, follows principles best suited to classification and indexing of accounting records.

FLIGHT

McCOOK FIELD ALTITUDE. Functioning of Supercharger in Altitude Flight. Aviation, vol. 12, no. 2, Jan. 9, 1922, p. 51. Excerpt of report of John A MacReady on his record breaking altitude flight at McCook Field, dealing with technical aspects of flight and giving summary of data obtained with respect to supercharger, engine and propeller.

SOARING. The Starting of Soaring Airplanes (Start von Segelflugzeugen), E. Offermann. Zeit, für Flugtechnik u. Motorlufstchiffahrt, vol. 12, no. 22, Nov. 30, 1921, pp. 327-331, 13 figs. Investigation of following problems is said to be necessary in order to diminish danger to life and material: Improvement in airplane construction that will render it possible to start and fly with as low a wind as possible; training of pilot especially for motorless or soaring flight; study of relations between formation of land and nature of soil and air movements and their dependence upon one another.

FLOOD CONTROL

MIAMI CONSERVANCY DISTRICT. Flood Measures in the Vicinity of Dayton, Ohio, Arthur E. Morgan. West. Soc. Engrs. Jl., vol. 27, no. 1, Jan. 1922, pp. 1-6, and (discussion) pp. 6-12, 9 figs. Account of difficulties encountered in planning flood control work in Miami Conservancy District. In discussion construction details are dealt with.

FLOW OF WATER

SPIRAL RIVETED PIPE. Flow of Water Through Spiral Riveted Steel Pipe, F. W. Crewe and R. R. Martin. Eng. & Contracting, vol. 57, no. 2, Jan. 11, 1922, pp. 41-42, 2 figs. Data and results of investigation upon flow of water through 4, 6, 8 and 10 in. galvanized spiral riveted steel pipes, dealing primarily with relation of friction loss to velocity in straight runs, both when flow was directed with and against lap. (Abstract.) Bul. Eng. Experiment Station of Purdue University.

FORGING

MILD STEEL. Forging Experiments with Mild Steel. Paul J. Junkers. Forging & Heat Treating, vol. 7, nos. 10 and 11, Oct. and Nov. 1921, pp. 518-523 and 553-556, 22 figs. Oct: Results of experiments to determine resistance of steel to deformations and influence of kneading and forging temperatures upon physical properties of a 13 and .50 C steel. Nov.: Improvement in structure due to forging is greater in .50 than in .13 carbon steel; finishing temperatures important.

FOUNDRIES

BRASS. Casting Small Parts in Production Foundry, Gerard Frazar. Iron Age, vol. 108, no. 26, Dec. 29, 1921, pp. 1653-1656, 7 figs. Describes new foundry of Gilbert & Barker Mfg. Co., Springfield , Mass., equipped for continuous pouring which when run at capacity will give employment to about 300.

CHILLED ROLLS. New Foundry for Casting Chilled Rolls, George F. Tegan. Iron Age, vol. 109, no. 1, Jan. 5, 1922, pp. 38-42, 7 figs. Raw material charged in air furnaces direct from stock pile at Garrison foundry, Pittsburgh.

CORE MIXING. Core and Sand in the Foundry, G. Pouplin. Brass world, vol. 17, no. 12, Dec. 1921, pp. 345-350. The making and mixing of cores as practised today in the best French foundries. Notes on core drying, glutrin and avebenc, and action of tar-oil on sand. (Abstract.) From Fonderie Moderne.

ENGINEERING COSTS. Obtaining Engineering Costs in Foundry and Machine Shop, Howell B. May. Iron Trade Rev., vol. 69, nos. 19, 21, 23 and 25, Nov. 10, 24, Dec. 8 and 22, 1921, pp. 1218-1221, 1356-1358, 1456-1458, 1485-1489 and 1619-1622 and 1630, and vol. 70, no. 3, Jan. 19, 1922, pp. 206-210, 30 figs. [illegible] of adequate costs with detailed application [illegible] iron and brass foundries machine shop and [illegible] metal department. Nov. 10: General outline of plan. Nov. 24: Cost plan [illegible] and expense account. Dec. 22 Consolidation [illegible] Jan. 19 Financial Statements, graphics and [illegible]

RAILWAY IRON AND STEEL. Control in a Railway Iron and Steel Foundry, G. N. Shawcross. Engineering, vol. 112, no. 2920, Dec. 16, 1921, pp. 832-836, 6 figs. [illegible] materials in well-known [illegible] & Yorkshire Ry. at Horwich, England, showing [illegible] what methods work is turned out. Address [illegible]

FUELS

AMERICA'S RESOURCES. America's Fuel Resources. Robert G. Skerrett. Sci. Am., vol. 126, no. 2, Feb. 1922, pp. 86-87, 3 figs. Data on deposits and consumption. Presents charts showing how consumption of petroleum and coal has increased since 1880.

FURNACES

OXY-ACETYLENE. An Oxygen-Acetylene High-Temperature Furnace, Hewitt Wilson. Am. Ceramic Soc. Jl., vol. 4, no. 10, Oct. 1921, pp. 835-841, 2 figs. Detailed description to show use of oxy-acetylene gas in a small furnace for using refractory cones. Advantages of furnace.

FURNACES, BOILER

SOLID AND LIQUID FUELS. The Pace Patent Furnace Door. Iron & Coal Trades Rev., vol. 103, no. 2808, Dec. 23, 1921, p. 917, 1 fig. Describes furnace for burning alternatively solid or liquid fuels and gives comparison of cost.

FURNACES, HEATING

INGOT-REHEATING. Ingot Reheating Furnace, H. E. Smythe. Iron Age, vol. 109, no. 2, Jan. 12, 1922 pp. 149-150, 1 fig. New design to avoid imperfect and unequal heating by proper control of incoming gases.

FURNACES, INDUSTRIAL

HIGH-PRESSURE GAS SYSTEM. High Pressure Gas and Its Application to Industrial Furnaces, F. J. Evans. Am. Soc. for Steel Treating Trans., vol. 2, no. 3, Dec 1921, pp. 213-222, 7 figs. Discusses low-pressure air and gas system with two-valve control and manual proportioning, and with single-valve control and automatic proportioning, and high-pressure gas system with single valve control and automatic proportioning.

G

GAS ANALYSIS

APPARATUS FOR CONTINUOUS. Apparatus for the Continuous Analysis of Gas, R. Mezger and M. Mueller. Am. Gas Jl., vol. 115, no. 26, Dec. 24, 1921, pp. 555-556. Describes apparatus developed in laboratories of Stuttgart Gas Works and used there with great success. Advantages of apparatus are: Work involved in manipulation is extremely small; it is possible to carry out three analyses simultaneously; time of analysis is reduced considerably; danger of obtaining incorrect results is eliminated. Translated from Gas u. Wasserfach, p. 63, 1921.

GAS MANUFACTURE

RECUPERATION. Preheating Air for Gas Furnaces, O. Lellep. Gas Age-Rec., vol. 48, no. 21 Dec. 10, 1921, pp. 773-776, 2 figs. Discusses the question of whether recuperation does or does not pay for industrial gas furnaces, and gives results of experiments. See also Am. Gas Jl., vol. 115, no. 22, Nov. 26, 1921, pp 479-482, 3 figs.

RETORTS. Observations on the Practice of Vertical Retorts. Gas Jl., vol. 156, no. 3053, Nov. 16, 1921, pp. 501-503 and (discussion) 503-504. Describes Walsall Woodall-Duckham installation; drying, lighting up, and letting down; emphasizes importance of each portion of plant working to the clock.

GAS PRODUCERS

CORROSION OF COOLING SYSTEM. Corrosion of a Producer-Gas Cooling System, Lloyd E Jackson. Chem & Met Eng, vol. 26, no. 2, Jan. 11, 1922, pp. 60-64, 5 figs. Cooling water of high acidity and containing much dissolved oxygen and suspended coke dust causes deterioration of cooling system at plant of Providence Gas Co., Providence, R. I. Remedial measures are suggested.

TESTS WITH ALBERTA COALS. Gas Producer Trials with Alberta Coals, John Blizard and E. S. Malloch. Canadian Dept. of Mines, Bul. no. 33, 1921, 40 pp. 23 figs. Tests were carried out in Westinghouse, double-zone, gas producer. Aim of trials was to ascertain suitability of the various fuels for giving a clean combustible gas when burned in the producer. Results show that all fuels except one are suitable but that less than one-half can be recommended for continuous operation in producer.

GASES

PUMP AND MIXER. The Roturbo Gas Pump and Mixer. Engineer, vol. 132, no 3444, Dec. 30, 1921, p. 704, 1 fig. Describes Rees Roturbo gas pump and mixer for creating a very intimate mixture between gases and liquids and effecting required solution or chemical action in smallest possible time and space. It is designated to draw large volumes of gas from comparatively low vacuum and to mix them with the entraining liquid.

GEAR CUTTING

Broaching Machine. Gear Cutting by Broaching Machine. Eng. Production, vol. 3, no. 65, Dec. 29, 1921, p. [illegible] gears, circular cutters, saws, etc., particularly adapted for manufacture on extensive basis, [illegible]

Spur-Gear Machine. Cutting Spur Gears on the Shaper. Eng. Production, vol. 3, no. 64, Dec. 22, 1921, p. 87, 1 fig. [illegible] for generation of spur gears having correct teeth form, no matter what the number of teeth.

GEARS

Involute. Design of Bevel, Helical and Worm Involute Gears, A. B. Cox. Am. Mach., vol. 56, no. 3, Jan. 19, 1922, pp. 101-107, 8 figs. Application of data of author's previous articles. Determination of helix and tooth angles. Relation between interference, number of tooth and sliding action.

The Evolution of the Involute Gear Tooth—X, A. Fisher. Machinery (Lond.), vol. 19, no. 483, Dec. 29, 1921, pp. 380-384, 6 figs. Discusses relation between tooth depth and thickness; backlash; generating teeth of conjugate thickness.

Tooth Shape. Gear Tooth Shape and Its Relation to Standardization, E. W. Miller. Automotive Industries, vol. 45, no. 24, Dec. 15, 1921, pp. 1167-1173, 26 figs. Discusses properties of involute form of gear tooth. True involute teeth with a certain pressure angle and relation between addendum and diametral pitch will not interfere with pinions down to 12 teeth. Such a system would facilitate universal interchangeability. Condensed from paper read before Am. Gear Manufacturers' Assn.

Worm. Worm Gear Generator. Machy. (Lond.), vol. 19, no. 481, Dec. 15, 1921, pp. 325-327, 9 figs. Describes in detail machine built by Smith & Coventry, Ltd., Manchester.

GIRDERS

Bending Moments. Graphic Determination of Bending Moments in a Girder Supporting Traffic Loads by Means of Cross Bars (Détermination Graphique des moments fléchissants maxima dans une poutre supportant des charges mobiles par l'intermédiaire des traverses), Smoukovitch and Barbillion. Le Génie Civil, vol. 79, no. 25, Dec. 17, 1921, pp. 533-535, 5 figs.

GRAIN ELEVATORS

Explosions. The Northwestern Elevator Explosion, David J. Price. Jl. Western Soc. of Engrs., vol. 26, no. 12, Dec. 1921, pp 401-417 and (discussion) 417-419, 7 figs Discusses in detail damage done to elevator operated by Armour Grain Company, South Chicago; theories advanced as to cause of explosion; lessons to be learned from the explosion; recommendations.

Pneumatic. Pneumatic Grain Elevators, R. E. Knight. Engineering, vol. 112, no. 2921, Dec. 23, 1921, pp. 864-866, 1 fig. Deals with pneumatic discharge of grain from ships, and more particularly with two modern examples of floating and quayside plants in which oil engines or motors, and high-speed rotary exhausters, have replaced vertical or horizontal compound steam engines and reciprocating exhausters, as main power plant of installation. Paper read before Instn. Mech. Engrs. (British). See also Engineer, vol. 132, no. 3443, Dec. 23, 1921, pp. 685-687, 1 fig.

GRINDING

Differential Spider Arms. Grinding Differential Spider Arms, Charles Kotersall. Am. Mach., vol. 55, no. 25, Dec. 22, 1921, pp. 1009-1010, 3 figs. Method which eliminates use of centers and an inspection gage for insuring accuracy in alignment

Surface. Why Work Curls Towards the Wheel While Being Surface Ground, E. A. Dixie. Am. Mach., vol. 55, no. 25, Dec 22, 1921, pp. 1006-1007, 4 figs. Plausible theory deduced from long experience. Work heated beyond critical point in numberless places takes permanent set when quenched by coolant.

GRINDING MACHINES

Railroad Shops. The Grinding Machine in the Railroad Shop, Frank A. Stanley. Am. Mach., vol. 56, no. 2, Jan. 12, 1922, pp. 64-65, 10 figs. Advantages of grinding for finishing parts to size. Grinding operations on locomotive parts. Increasing efficiency of motion mechanism.

H

HANDLING MATERIALS

German Mechanical Devices. Development of Mechanical Handling Devices in Germany during and since the War, George F. Z[illegible] & Indus. Management, vol. 6, nos. 18, 22, 24 and 26, Nov. 3, Dec. 1, 15 and 29, 1921 pp. 514-515, 1 fig.; 645-646, 2 figs.; 706-707, 7 figs. and 760-761, 1 fig. Information resulting from author's visit to German industrial centers. Points out that band conveyor has been superseded by other devices owing to high cost of bands. Nov. 3: Improved automatic colliery tippler. Dec. 1: Mechanical removal of ashes from locomotives. Dec. 15: Latest developments in coal-face conveyors. Dec. 29: Pneumatic handling.

Textile Mills. Material Handling in the Textile Industry, R. M Gates. Management Eng., vol. 2, no 1, Jan. 1922, pp. 13-17, 8 figs. Shows types of electric trucks, belt conveyors, gravity conveyors, inclined elevators, etc., employed in textile mills. Points out importance of material handling.

HEAT

Recovery from Earth. Ground Heat as the Most Important Source of Energy (Die Erdwärme als wichtigste Energiequelle) Rauch u. Staub, vol. 12, no. 3, Dec. 1921, pp. 16-18. Review of developments in study of the recovery [illegible] from earth interior for technical purposes.

HEAT BALANCE

Electric Plants. Heat Balance of the Connors Creek Plant of the Detroit Edison Company, C. Harold Berry and F. E. Moreton. Mech. Eng., vol. 44, no. 1, Jan. 1922, pp. 22-25, 8 figs. Describes briefly apparatus in plant, followed by discussion of ideal operating conditions, and presents actual results. Includes table showing thermal balance sheet for April 1921.

HEAT INTERCHANGERS

Experiments With. Experiments with Heat Interchangers, F. Russell Bichowsky. Jl. Indus. & Eng. Chem., vol. 14, no. 1, Jan 1922, pp. 62-64, 3 figs. Discusses the Linde, Hampton, and Nelson types of interchangers.

HEAT PUMPS

Evaporators With. Experiences on Evaporators with Heat Pumps, E. Wirth. Mech. Eng., vol. 44, no 1, Jan. 1922, pp. 49-51, 5 figs. Points out that whereas until now investigations have been made only with regard to liquids with low-boiling point, data are now available on heavier liquids Account of author's experiences with heat pump operation. Translated from Zeit. des Vereines deutscher Ingenieure, vol. 65, no. 46, Nov. 12, 1921, pp. 1183-1186.

HEAT TRANSMISSION

Problems. Heat Transfer, W. H. McAdams and T. H. Frost. Jl. Indus. & Eng. Chem., vol. 14, no. 1, Jan. 1922, pp. 13-18, 2 figs. Problems arising in the field of heat transfer and rational method for studying them. Results of preliminary experiments to determine numerical value of coefficient of heat transfer between condensing vapors and a pipe.

HEAT TREATING

Plant Operation. The Complete Operation of a Modern Heat Treat Department, Thomas B. Fordham. Factory, vol. 28, no. 1, Jan. 1922, pp. 31-34, 6 figs. Method of control which has been successful in reducing scrap loss and bringing down manufacturing cost.

HEATING, FACTORY

Bleeder Steam. Using Bleeder Steam in Factory Heating, J. A. McGillivray. Power House, vol. 14, no. 22, Nov. 21, 1921, pp. 21-27, 11 figs. Bleeder type is especially furnished where low pressure steam is required for heating, in combination with electric motive power. Bleeder types are designed for a variety of conditions of operation, both in condensing and non-condensing units, or any combination of the two.

HEATING, STEAM

Equipment. Features of Central Steam Heat Plant Equipment, W. A. Scott. Elec. Rev., (Chicago), vol. 79, no. 21, Nov. 19, 1921, pp. 759-760, 1 fig. Underfeed stokers provide for boiler operation at 250 per cent of rated capacity; modern coal and ash handling apparatus reduces operating labour; water softener used to treat well water.

HIGHWAYS

Research. The Status of Highway Research, W. K. Hatt. Eng. News-Rec., vol. 88, no. 2, Jan. 12, 1922, pp. 62-64. Major developments in field of investigation cited. Census of research planned by Advisory Board on Highway Research of Nat. Research Council.

Wisconsin System. Developing a Highway Transportation System, A. R. Hirst. West. Soc. Engrs. Jl., vol. 27, no. 1, Jan. 1922, pp. 13-18 and (discussion) pp. 19-25, 11 figs. Describes creation of State Trunk Highway System of Wisconsin involving 5000 mi. of highway.

HYDRAULIC TURBINES

Castings, Making. Making Water Turbine Castings, H. E. Diller. Foundry, vol. 49, nos. 22 and 23, Nov. 15 and Dec. 1, 1921, pp. 873-878 and 920-925, 19 figs. Nov. 15: Describes molding the large scroll-case castings; skeleton patterns keep down expense of equipment. Dec. 1: Method of molding small runners with vanes of curved steel plate and larger sizes with cast-iron vanes.

Impulse Type. Caribou Power Plant Has World's Largest Impulse Wheel, W. M. White. Jl. Electricity & Western Industry, vol. 47, no. 12, Dec. 15, 1921, pp. 465-466, 4 figs. Describes machinery installed in Caribou plant of Great Western Power Co., having normal capacity of 30,000 hp. each under 1008-ft head, at 171 r.p.m.

REACTION. Hydraulic Reaction Turbines, D. J. McCormack. Elec. Jl., vol. 19, no. 1, Jan. 1922, pp. 11-16, 13 figs. Discusses runners, casing, bearings, shaft, gate mechanism, etc.

HYDRAULICS

EDDY CURVES. [illegible] for the Determination of Eddy Curves (Nouvelle méthode pour la détermination des courbes de remous), [illegible]. Le Génie Civil, vol. 79, nos. 23 and 24, Dec. 3 and 10, 1921, pp. 488-492 and 515-516, 7 figs. Reviews methods in use and develops formulas for an improved method which tests made show to be satisfactory.

LABORATORY. The Hydraulic Laboratory, S. G. Roberts. Sci. Am., vol. 126, no. 1, Jan. 1922, pp. 10-11, 5 figs. Describes equipment and experimental work done at hydraulic laboratory at Petty's Island, Pa.

I

ILLUMINATION

CALCULATION OF INTENSITIES. Illumination Calculations for Various Planes, J. H. Kurlander. Elec. Rev. (Chicago), vol. 79, no. 24, Dec. 10, 1921, pp. 885-887, 3 figs. Derivation of equation showing simple relations between illumination intensities, source candlepower, and dimensions that can be easily determined in the field or from room plans.

FACTORY. Factory Illumination. Eng. Production, vol. 3, no. 63, Dec. 15, 1921, pp. 570-571. Notes on installation of lighting systems. Discusses varieties of glass used for windows of industrial works, and different systems of artificial lighting, consisting of direct, semi-direct and indirect lighting.

IMPACT TESTING

PAVEMENTS. Tests of Impact on Pavements by the Bureau of Public Roads, C. A. Hogentogler. Pub. Roads, vol. 4, no. 7, Nov. 1921, 1-18 and 27, 67 figs. Reports on behaviour of various pavement slabs in terms of impact force which they sustained, forces being computed from space-time curves.

INDICATORS

STEAM-ENGINE. The Detection of Errors in the Steam-Engine Indicator. Power, vol. 55, no. 3, Jan. 17, 1922, pp. 103-105, 5 figs. Deals with most probable errors.

INDUSTRIAL MANAGEMENT

FACTORIES. Technical Service at the Factory (Les Services d'études dans les usines), Emm. La Langlois. La Vie Technique et Industrielle, vol. 3, no. 26, Nov. 1921, pp. 132-133. Preparation of new installations; improvements in material, tools and processes; study of upkeep and repairs; filing of information and documents on all matters.

GANTT CHARTS. How a Manager Uses Gantt Charts, Frank W. Trabold. Management Eng., vol. 2, no. 1, Jan. 1922, pp. 28-30. Discusses use of the Gantt load, idleness-expense, and man-record charts, some things they disclosed, and their value to executive.

INSPECTION SYSTEM. The Delco Inspection System—II and III. Machinery (Lond.), vol. 19, nos. 473 and 475, Oct. 20 and Nov. 3, 1921, pp. 71-75, 14 figs., and pp. 122-125, 12 figs. Typical examples of gaging fixtures used by Dayton Engineering Laboratories Co. in manufacture and inspection of company's product.

PLANNING. Departmental Collaboration, James Edgar. Eng. & Indus. Management, vol. 6, no. 24, Dec. 15, 1921, pp. 690-692. Explains scientific planning of output, which has become essential with introduction of quantity-producing methods, consequent upon development of automatic machine.

PROCESS CHARTS. Process Charts and Their Place in Management, Frank B. and L. M. Gilbreth. Mech. Eng., vol. 44, no. 1, Jan. 1922, pp. 38-41 and 70, 4 figs. Device for visualizing process as means of improving it. Authors point out place of process chart in management and present established working data used successfully in numerous working installations for many years; also its simplicity, field of application, its relation to standardization, etc.

PRODUCTION ORDER QUANTITY. Determining the Production Order Quantity, W. E. Camp. Management Eng., vol. 2, no. 1, Jan. 1922, pp. 17-18, 2 figs. Writer derives formula for determining production order quantity such that total cost per unit for setting up plus interest on stores investment will be [illegible]

SERVICE DEPARTMENT. Service Work As a Phase of Production, S. Harold Greene. Management Eng., vol. 2, no. 1, Jan. 1922, pp. 7-11. Outlines system of [illegible] as a [illegible] and integral part of production.

STORES CONTROL. Some Notes on Stores Control. Eng. & Indus. Management, vol. 6, no. 24, Dec. 15, 1921, pp. 682-684, 2 figs. Notes on systematic recording and disposal of defective parts.

SMALL FACTORIES. Management Problems of the Small Factory, Ernest Cordeal. Indus. Management, vol. 63, no. 1, Jan. 1922, pp. 43-49, 2 figs. Machines, tools and appliances.

Organization and Management of the Small Shop, E. W. Leach. Am. Mach., vol. 55, nos. 17, 19 and 22, Oct. 27, Nov. 10 and Dec. 1, 1921, pp. 671-673, 754-756 and 883-885. Oct. 27: Small shop office work; why bookkeeping is essential; classifications of entries; value of credit. Nov. 10: Going after business; cause and effect of readjustment; function of advertising. Dec. 1: Qualifications of successful executive; co-operation between producers and management; modern business ethics.

TOOL-ENGINEERING DEPARTMENT. How Tool Engineering Cuts Costs, Joseph Lannen. Indus. Management, vol. 63, no. 1, Jan. 1922, pp. 12-20, 9 figs. System of supervising jigs, fixtures, gages and other equipment. Describes methods that have given satisfactory results in process of ascertaining costs in tool-engineering department.

WORKSHOPS. Workshop Management (Le contrôle à l'atelier), C. B. Thompson. L'Outillage, vol. 234, no. 46, Nov. 17, 1921, pp. 1232-1233. Discusses scientific management and its various applications.

See also Taylor System; Time Study.

INDUSTRIAL ORGANIZATION

BRITISH WORKS. An Efficient Works System. Eng. Production, vol. 3, nos. 60, 61, 62, Nov. 24, Dec. 1, 8 and 15, 1921, pp. 493-498, 517-522, 539-544 and 557-562, 59 figs. Detailed description of successful organization and system in works of Barr & Stroud, Ltd., Glasgow, manufacturers of high-grade precision instruments.

KNITTING MILL. The Organization of Knitting Mills, Carle M. Bigelow. Management Eng., vol. 2, no. 1, Jan. 1922, pp. 37-42, 5 figs. Solving problem of labour control.

INDUSTRIAL RELATIONS

HUMAN FACTOR. The Human Factor in Industry—IV, Clarence H. Northcott. Indus. Management, vol. 63, no. 1, Jan. 1922, pp. 36-41. What industry owes workers as members of the community. Notes on wage principles; rate fixing; organization to guarantee fair wages; security against unemployment; work preparatory school; care for working conditions; vocational selection; etc.

IMPROVEMENT OF. Various Plans to Improve Industrial Relations, Ray Vance. Can. Foundryman, vol. 12, no. 8, Aug. 1921, pp. 32-35. Discusses human elements, stock selling plans, bonus plans, industrial democracy, shop committee plans, etc.

WORKMEN'S CONTROL. The Workman in Control (Le Contrôle ouvrier). La Métallurgie, vol. 53, no. 46, Nov. 17, 1921, pp. 2141-2142. Discusses attitude of workers, industrial democracy, consent of labour, etc.

INDUSTRIAL TRUCKS

ELECTRIC. The Electromobile. Motor Transport, vol. 33, no. 879, Jan. 2, 1922, p. 13, 3 figs. Describes a battery-propelled vehicle of the 1- and 2-ton and the 4- and 5-ton types, the latter having a four-wheel drive.

INSULATING MATERIALS

BREAKDOWN TESTS. Breakdown Tests on Insulating Materials, N. A. Allen. Elec. Rev. (Lond.), vol. 89, no. 2301, Dec. 30, 1921, p. 876, 3 figs. Describes a simple guard-ring method.

INSULATORS, ELECTRIC

PORCELAIN. The Manufacture and Testing of High Tension Porcelain Insulators, A. D. Allen. Elec. News, vol. 30, no. 16, Aug. 15, 1921, pp. 33-35, 3 figs. Describes processes involved in making and care essential in inspecting.

INTERNAL-COMBUSTION ENGINES

COMPOUND. Compounding the Combustion Engine, Elmer A. Sperry. Mech. Eng., vol. 44, no. 1, Jan. 1922, pp. 27-32 and 74, 14 figs. Presents results of research by author extending over series of years, during which it is claimed that not only has high-pressure principle been thoroughly established, but all important requirements have been worked out, and an engine embodying practically all advantages has been subjected to long continuous runs.

DEVELOPMENT. Internal Combustion Engine, Charles E. Lucke. Nat. Engr., vol. 25, no. 12, Dec. 1921, pp. 604-607. Rising importance of oil-injection type. Review of development.

See also [illegible] Engines; Automobile Engines; Diesel Engines; Oil Engines; Semi-Diesel Engines.

IRON

ELECTROLYTIC. Electrolytic Iron a Commercial Product, Bradley Stoughton. Iron Age, vol. 109, no. 1, Jan. 5, 1922, pp. 32-36, 5 figs. Eustis process compared with others. An ore instead of scrap as anode. Tests and properties, fields of usefulness.

L

LABORATORIES

[illegible] vol. 63, no. 1, Jan. 1922, pp. 26-29, 3 figs. How research laboratories assist business. Users of industrial laboratories.

LAKES

Regulating Level. Proposed Regulation of Lake Ontario. Can. Engr., vol. 41, no 26, Dec. 29, 1921, pp. 1 and 11-12, 4 figs. Studies by Canadian and U. S. Government engineers for International Joint Commission. Appendixes to report on improvement of St. Lawrence River from Lake Ontario to Montreal.

LATHES

[illegible] Ltd., Bredbury, England, which is said to be much more powerful than lathes [illegible]

Turret. Turret Lathe Tooling, J. F. Yeoman. Machy. (N. Y.), vol. 28, no. 5, [illegible] housings on foster turret lathes.

LEAD ALLOYS

[F]rary Metal. The Electrolytically Produced Calcium-Barium-Lead Alloys Comprising Frary Metal, William A. Cowan, L. D. Simpkins and G. O. Hiers. Chem. & Met. Eng., vol. 25, no. 26, Dec. 28, 1921, pp. 1181-1185, 13 figs. Equilibrium diagram and microstructure of barium-lead and calcium-lead alloys. Ternary alloy hardens and strengthens on aging; is hard at moderate temperature; can be melted without change in analysis, and is a very fine bearing metal. Paper, slightly condensed, read before Am. Electrochem. Soc.

LEATHER

Tanning. Nature and Essential Character of the Tanning Process and of Leather, Friedrich Knapp. Jl. Am. Leather Chemists Assn., vol. 16, no. 12, Dec. 1921, pp. 658-681. Discusses cleansing; tanning; tanning experiments with alum, aluminum sulphate, aluminum chloride, aluminum acetate, ferric chloride, stearic acid, rosin, picric acid, etc. Translated from Collegium, nos. 589 and 590, 133 and 166, 1919.

LIQUIDS

Corrosive, Handling. Anti-Corrosive Chemical Engineering Plant. Canadian Chemistry and Metallurgy, vol. 5, no. 12, Dec. 1921, pp. 341-342, 2 figs. Some English chemical equipment designed for special service in handling acids and cordoring liquids.

LOCOMOTIVES

Design. Modern Locomotive Engine Design and Construction—LXXVI. Ry. Engr., vol. 42, no. 503, Dec. 1921, pp. 458-463, 7 figs. Practical considerations affecting production of an economical form of coupling rod.

[illegible]

Mountain Roads. Shay Geared Locomotives for Mountain Roads. Ry. Age, vol. 71, no. 25, Dec. 17, 1921, pp. 1198-1210, 4 figs. 150-ton Shay for Greenbriar, Cheat & Elk R.R. High sustained tractive effort compared with Mikados.

Rebuilding. Rebuilding Old Locomotives, Carl B. Smith. New England Railroad Club, Dec. 13, 1921, pp. 207-214 and (discussion) 215-228. Discusses replacing of boilers, superheater equipment, cylinders, valve gears, frames, automatic fire doors, and other parts.

Superheater. Locomotives of the Pacific Type of the Midi Company. France (Note sur les locomotives Pacific à deux cylindres à simple expansion et surchauffe de la Compagnie des Chemins de Fer du Midi), M. Leboucher. Revue Générale des Chemins de Fer et des Tramways, vol. 40, no. 11, Nov. 1921, pp. 291-303, 7 figs., partly on supp. plate. Superheater, two-cylinder twin-action type. Complete specifications and data.

LUBRICANTS

[illegible] and Distribution. [illegible] F. C. Henn. Am. Mach., vol. 56, no. 1, Jan. 5, 1922, pp. 4-7. 10 figs. Oil pumped from tank cars to storage tanks; centrifugal machines separate used oil from chips; elaborate system of reclamation and distribution.

Viscosity and Friction. Viscosity and Friction, Winslow H. Herschel. Soc. Automotive Engrs. Jl., vol. 10. no. 1, Jan. 1922, pp. 31-41, 2 figs. Discusses viscosity effect in complete-film-lubrication regime; viscosity estimation at one temperature from observed viscosity at another temperature; friction testing of bearing metals; oiliness of lubricants; oil-friction testing machines; etc.

LUBRICATING OILS

Steam-Turbine. Essential Qualities of Oil for Steam Turbine Lubrication. J. Y. [illegible] 770-772, 3 figs Definition of viscosity of oil: tests required to determine quality [illegible]

The Viscosity of Steam-Turbine Oils, V. M. Hatch. Power, vol. 54, no. 26, Dec. 27, 1921, pp. 1011-1012. Factors controlling friction in bearings. Viscosity at operating temperature is said to be most important consideration.

M

MACHINE TOOLS

Drives. The Driving of Machine Tools, Hubert Bentley. Eng. & Indus. Manage- [illegible] and direct-gear drive in transmitting power, and advent of direct drive from lineshaft to single-pulley all-gear-driven machine.

Feeds and Speeds. Feeds and Speeds as Production Factors, Albert A. Dowd and Frank W. Curtis. Machy. (N.Y.), vol. 28, no. 5, Jan. 1922, pp. 381-383, 5 figs. [illegible] savings made possible by increasing rate of feed on a lathe; savings effected [illegible]

MACHINERY

Special and Automatic. When Is It Economical to Install Special and Automatic Machinery? A. L. DeLeeuv. Management Eng., vol. 2, no. 1, Jan. 1922, pp. 19-24, 1 fig. Includes chart showing various conditions met in grouping special machinery. Notes on determining costs under part-time operation; figuring value of machinery; single-purpose machines; operating automatic machinery in cycles; etc.

MALLEABLE CASTINGS

Foundry Problems. Pertinent Facts Concerning Malleable-Iron Castings, Enrique Touceda. Soc. Automotive Engrs. Jl., vol. 10, no. 1, Jan. 1922, pp. 53-61, 12 figs. Discusses foundry difficulties; casting defects; shrinkage and machinability; improvements in annealing-oven construction and operation.

MANGANESE STEEL

Electric. Manganese Steel Made in Electric Furnace, Larry J. Barton. Iron Age, vol. 109, no. 1, Jan. 5, 1922, pp. 4-8 and 109, 11 figs. Discusses melting practice for castings. Use of manganese steel scrap. Deoxidizing with manganese ore. Heat treatment.

Welding. Welding Manganese Steel, H. R. Pennington. Welding Engr., vol. 12, Dec. 1921, pp. 21-23 and (discussion) 23-24, 2 figs. Frogs and crossing layouts put in service at a fraction of cost of new installation. Gives table showing effect of varying quantities of manganese and carbon on physical quality of steel. Discusses are welding methods. Paper read before Am. Welding Soc.

MARINE STEAM TURBINES

Blading Failures. Low Pressure Turbine Blading Failures in Destroyers, D. F. Ducey. Jl. Am. Soc. Naval Engrs., vol. 33, no. 3, Aug. 1921, pp. 512-540, 39 figs. The turbines are of the impulsive type having five rows of moving blades. The first and second are of monel metal, the third, fourth and fifth chrome-vanadium and chrome-nickel steel. Describes failures in detail and gives illustrations.

MATERIALS

Thermal Conductivity of Wearing. Thermal Conductivity of Some Wearing Materials, Emily S. Rood. Physical Rev., vol. 18, no. 5, Nov. 1921, pp. 356-361. Results of measurements made with samples of wooden, cotton, and silk materials.

METALS

Colloidal State. Colloidal State in Metals and Alloys—I, Jerome Alexander. Chem. & Met. Eng., vol. 26, no. 2, Jan. 11, 1922, pp. 54-58. Molten metal. Shows that many of important phenomena of metals and alloys are due to colloidal state of subdivision, and that portion of the metal or alloy tends to remain in the colloidal state and exert a powerful influence upon physical properties of final solid magma.

Electrodeposition. The Electro-Deposition of Metals—VIII, W. E. Hughes. Beama, vol. 9, no. 6, Dec. 1921, pp. 555-562. Discusses electrodeposition of lead. Applications, properties, lead-plating solutions, and microstructure.

Fatigue. Fatigue of Metals Under Repeated Stress, Moore and Kommers. Chem. & Met. Eng., vol. 25, no. 25, Dec. 21, 1921, pp. 1141-1144, 6 figs. Results of experiments. Carbon steels will not fail by "fatigue" if stressed below a definite amount, quickly determined by measuring heat generated in specimen during test.

METALLOGRAPHIC TESTING. Metallographic Testing. U. S. Bur. of Standards Circular, no. 42, Aug. 29, 1921, 11 pp., 4 figs. Study of fundamental conditions, structure, constitution, and treatment of meatls and alloys. Discusses different lines of metallographic testing carried out by Bur. of Standards.

STRUCTURE. Structure and Related Properties of Metals. U. S. Bur. Standards Circular, no. 113, Sept. 7, 1921, 104 pp., 71 figs. Discusses general nature of structure of metals, methods for revealing it, and dependence of properties of metals as a whole upon its structural features. Describes methods in use for revealing chemical unhomogeneity, crystalline heterogeneity, physical unsoundness, and mechanical nonuniformity. Discusses principles underlying action of etching reagents; conditions affecting structure, chemical composition, application of heat, and mechanical working of metal; and dependence of mechanical properties and chemical behavior upon structure condition of material.

SURFACE FLAWS. Influence of Surface Flaws on Strength of Metals, Horace C. Knerg. Automotive Industries, vol. 45, no. 25, Dec. 22, 1921, pp. 1216-1217, 6 figs. Shows that surface flaws have a pronounced effect upon metals subjected to fatigue through repeated stresses, but that such flaws do not always decrease strength under constant load conditions.

TESTING. Testing Metal by Repeated Stress, H. F. Moore and J. B. Kommers. Iron Trade Rev., vol. 69, no. 25, Dec. 22, 1921, pp. 1623-1630, 7 figs.; also Eng. News-Rec., vol. 88, no. 2, Jan. 12, 1922, pp. 76-78, 3 figs. Fatigue investigation is broadened to include variety of steels and several heat treatments. Results show definite relation between Brinell hardness and endurance limit. Rise of temperature test used to predict limit. (Abstract) Bul. no. 124, Engineering Experiment Station, University of Illinois.

METRIC SYSTEM

ENGLISH SYSTEM VS. A Digest of "The Metric versus the English System of Weights and Measures." Nat. Indus. Conference Board, Special Report No. 20, Dec. 1921, 11 pp. Presents facts and arguments on whether metric system should be substituted for English system of weights and measures in the United States.

MILLING CUTTERS

SHARPENING. How to Sharpen Milling Cutters, Fred. B. Jacobs. Abrasive Industry, vol. 2, no. 12, Dec. 1921, pp. 395-401, 19 figs. Cutter grinding operations are expedited by using a machine designed for the purpose; form cutters required careful attention.

MILLING MACHINES

MANUFACTURING OPERATIONS. Manufacturing Operations on Milling Machines, Robert Mawson. Am. Mach., vol. 55, no. 25, Dec. 22, 1921, pp. 996-997, 10 figs. Special toolholders for facing four-step cones. Fixtures and tools_for machining milling machine heads. A unique angle-facing fixture.

MOLDING METHODS

FLOUR-MILL ROLLS. Molding and Casting Chilled Flour-Mill Rolls, G. O. Vair. Can. Foundryman, vol. 12, no. 8, Aug. 1921, pp. 20-21 and 25, 5 figs. Designs for molds; casting; machining.

MOTORSHIPS

PASSENGER LINER. The First Motor Passenger Liner, A. P. Chalkley. Mar. Eng., vol. 17, no. 1, Jan. 1922, pp. 31-36, 11 figs. Describes the Aba assigned to Liverpool-Africa route. Gross tonnage, 8,000; indicated horsepower, 6,400.

N

NICKEL

PLANT AND OPERATIONS. The International Nickel Co. of Canada Ltd., A. R. R. Jones. Iron & Steel of Can., vol. 4, no. 10, Nov. 1921, pp. 269-271, 4 figs. Describes its plants and operations; Monel metal and its uses.

NOZZLES

[illegible] FLOW. The Use of Nozzles in Measuring Pulsating Flow. [illegible] vol. 26, no. 1, Jan. 4, 1922, pp. 32-34, 3 figs. Discusses [illegible] of nozzles for measuring differential pressure unless the flow curve is known as a function of time.

O

OIL FIELDS

NORTHERN CANADA. The Mackenzie Oil-field of Northern Canada, T. O. Bosworth. [illegible] Petroleum Technologists Jl., vol. 7, no. 28, Oct. 1921, pp. 276-291 and [illegible] 291-297, 9 figs. Discusses transportation to oil-field, problem [illegible]ing the oil, stratigraphy and geology, occurrence of oil, and exploit-[illegible]

OIL FUEL

BURNING. The Burning of Oil Fuel and the Arrangement of Machinery Necessary, together with Observations and Comments Drawn from Actual Conditions, A. Keens. Trans. Inst. Mar. Engrs., vol. 33, Oct. 1921, pp. 337-363 and (discussion) 363-375, 12 figs. Discusses advantages of fuel oil; storage spaces; oil fuel pumps; piping, holders and burners; furnaces and combustion chambers; pumping arrangement; etc.

GLASS INDUSTRY. The Application of Oil Fuel in the Glass Industry. Jl. Soc. Glass Technology, vol. 5, no. 19, Oct. 1921, pp. 286-300 and (discussion) 300-307. Symposium. Comparison with gas firing.

INJECTION AND COMBUSTION. Injection and Combustion of Fuel-Oil—VI and VII, C. J. Hawkes. Motorship, vols. 6 and 7, nos. 10 and 2, Oct. 1921 and Jan. 1922 p. 820, 4 figs. and p. 34, 6 figs. Experiments with solid-injection and air-blast in marine Diesel engines.

MEXICAN. The Production and Combustion of Mexican Fuel Oil—VIII, J. M. Pettinbell and J. R. Carlson. Combustion, vol. 5, no. 6, Dec. 1921, pp. 254-257 6 figs. Discusses economy in oil burning operation.

STEAM GENERATION. Liquid Fuel and Its Application for Steam Generation. J. H. Anderson. Inst. of Mar. Engrs. Trans., vol. 33, Dec. 1921, pp. 521-563 and (discussion) 563-568, 27 figs. Discusses fractional and continuous distillation and use of fuel oil, Describes a number of oil fuel heaters and systems of fuel-oil burning.

SULPHUR IN. Effects of Sulphur in Fuel Oil, Allen F. Brewer. Power, vol. 55, no. 2, Jan. 10, 1922, pp. 50-51. States that presence of sulphur is detrimental, but its deteriorating effect can be largely avoided by adopting proper precautions.

OILS

VEGETABLE, MACHINES FOR PRODUCING. Machinery for Vegetable Oil Production. Eng. Rev., vol. 35, no. 6, Dec. 1921, pp. 182-187, 8 figs. Reviews development of these machines and compares the various designs.

OPEN-HEARTH FURNACES

FUELS USED. Fuels Used in Open-Hearth Practice, Edwin F. Cone. Iron Age, vol. 108, no. 25, Dec. 22, 1921, pp. 1589-1591. Analysis of 1920 ingot and castings production. Producer gas chiefly employed for ingots and oil for castings. Results of answer to questionnaire sent to producers of open-hearth steel ingots and steel castings.

OXY-ACETYLENE WELDING

BRONZE CONDENSER SHEETS. Bronze Condenser Sheets, H. I. Walsh. Welding Engr., no. 12, Dec. 1921, pp. 27-28 and 40, 7 figs. Gas welding gives practical solution of problem arising from increase in size of ships. Paper read at Internat. Acetylene Ass. Convention.

P

PAPER

ENGINE SIZING. Engine Sizing of Paper. Paper, vol. 29, no. 14, Dec. 7, 1921, pp. 9-15. Discusses chemical reactions which take place when alum is added to a beater furnished with milk of rosin, and concludes that free rosin is the most active sizing agent, though aluminum and sodium resinates play apart. Translated from Le Moniteur de la Papeterie Française.

PAPER MILLS

COSTING. Main Elements of Paper Mill Costing, L. W. Farrow. Paper, vol. 29, no. 12, Nov. 23, 1921, pp. 24-28. Cost systems for fine paper mills and some fallacies in costing.

PAVEMENTS, ASPHALT

SHOVING. Causes of Shoving of Asphalt Pavements, Prevost Hubbard. Good Roads vol. 61, no. 21, Nov. 23, 1921, pp. 233-235. Co-operative investigations being carried on by U.S. Bur. Pub. Roads and several cities to determine causes of shoving under traffic. Paper presented before Am. Soc. Mun. Improvements.

PETROLEUM

REFINING. General Oil Refining Practice, C. D. Dean. Eng. Inst. Can. Jl., vol 5, no. 1, Jan. 1922, pp. 3-10. Selection of refinery site; boiler plant and pumping requirements, details of distillation and treatment processes for oils, pitches and asphalts; storage; fire protection precautions; railway trackage and wharf requirements.

PHOTOGRAPHY

Rendering Objects in Relief. [illegible] de M. Louis Lumière. [illegible] no. 27, Dec. 1921, pp. 225-227, 8 figs. [illegible] Louis Lumière of rendering objects in relief.

PIERS

Masonry. Eccentric Pressure on Piers of Pressure-Resisting Materials. [illegible] Aristide Giannelli. Giornale del Genio Civile, vol. 59, Aug. 31, 1921, pp. 1921, pp. 497-513, 16 figs. Makes calculations for masonry piers of rectangular section.

PILES

Resistance. Resistance of Piles. [illegible] Annales des Ponts et Chaussées, vol. 4, July-August 1921, pp. 5-67, 11 figs. Discusses calculation of load in the light of recent experiments, effect of dimensions of pile, and weight of pile driver.

PIPE, STEEL

Hammer-Welded. Hammer-Welded Steel Pipe—How It Is Made and Wherein It Excels. Raw Materials, vol. 4, no. 11, Nov. 1921, pp. 384-391, 11 figs. Discusses advantages over butt-weld and lap-weld methods, and methods used by Nat. Tube Co.

PIPE, WROUGHT-IRON

Chart for. Wrought Pipe Data. Sanitary & Heat. Eng., vol. 96, no. 14, Dec. 30, 1921, p. 395. Chart containing valuable information for the sanitary and heating engineer.

PISTONS

Machining Castings and Rings. How a British Foundry Specializes, H. Cole Estep. Foundry, vol. 49, no. 22, Nov. 15, 1921, pp. 879-887, 22 figs. Describes English methods of making piston castings and pots for piston rings.

PLANERS

Testing. Planing Machine Studies. Engineering vol. 112, no. 2922, Dec. 30, 1921, p. 886. Results of experimental work carriedout in Germany by G. Schlessinger on a horizontal planing machine, driven by electric motor running at 160 r.p.m. with toothed gear and belting. Various improvements were tested and it was possible to greatly reduce power absorbed and almost completely overcome power fluctuations. Translated from pamphlet by G. Schlessinger and M. Kurrein.

POWER

Costs. How to Follow Up Power Costs—III, N. A. Craigue. Indus. Management, vol. 63, no. 1, Jan. 1922, pp. 55-59, 1 fig. Various methods of distribution. Meters may be used to actually measure power as consumed; cost rate applied, and final cost obtained is charge against product.

POWER FACTOR

Electric Systems. The Power Factor of Electric Systems ("Cos Y"). Siemens-Zeit., special no., Nov. 1921, 84 pp. 90 figs. Contains eight articles as follows: Origin and Action of Wattless Currents in A.C. Plants; by R. Rudenberg. Measurement of Wattless Current and Power Factor, by Georg Keinath. Electric Meters for Wattless Current and Their Use for Calculating Electric Energy, by W. V. Krukowski. Measures for Improvement of Power Factor of Electrical Plants, O. Burger. Improvement of Power Factor on Lines of the Siemens Works in Siemensstadt, chr. Müller. Parallel Operation of Power Plants, O. Burger. A Noteworthy Example of Power-Factor Improvement on a Large Distributing System. A. Hajek. Bibliography.

Integrating Wattless Power. Three-Phase Wattless Power, G. W. Stubbings. Beama, vol. 9, no. 6, Dec. 1921, pp. 550-554, 9 figs. Some methods of integration without the use of special meters.

POWER PLANTS

Design. Developments in Power Station Design. Engineer, vol. 132, nos. 3441, 2443 and 3444, Dec. 9, 23 and 30, 1921, pp. 613-614, 5 figs., partly on supp. plate; 668-669, 3 figs.; 702-704, 10 figs. Dec. 9: Describes extensions being made to boilerhouse of the Neasden power station of Metropolitan Ry., by John Thompson Water-Tube Boilers, Ltd., Wolverhampton. Dec. 23: 12,000-kw. turbo-generator installed at Neasden power station, and other important additions. Dec. 30: Application of airheaters to central-station boilers.

Modern European Tendencies in Power-Plant. Design, A. W. H. Griepe. Power, vol. 55, no. 2, Jan. 10, 1922, pp. 54-56. European tendency is now to supply large cities at high voltage from large generating stations near mines, and gradually to shut down small, inefficient local plants. Notes on modifications in boiler proportions, types of boilers in use, boiler tubes and superheaters, economizers, stokers, cinder and soot disposal, preheating of air, use of low-grade fuels, etc. The Bone-Schanabel surface-combustion process in Germany. Only horizontal types of turbines used.

Maxim Silencers, Use of. The Maxim Silencer in the Power Plant. Power, vol. 55, no. 3, Jan. 17, 1922, p. 91, 3 figs. Describes use of such silencers, patents [illegible] steam safety valves, air hoists, steam and air discharges from special apparatus.

Progress in 1921. The Year's Progress in the Power Plant Field. Power, vol. 55, no. 1, Jan. 3, 1922, pp. 2-14, 11 figs. Boiler efficiencies of 90 per cent when burning pulverized coal, seven notable steam plants put into operation, unusual interest in hydroelectric development, 220,000-volt electric power equipment; are some of outstanding features of 1921.

PRESSES

Hydraulic and Hand-Forcing. Hydraulic and Hand Forcing Presses in a Locomotive Shop, J. V. Hunter. Am. Mach., vol. 56, no. 3, Jan. 19, 1922, pp. 108-109, 5 figs. Horizontal press for forcing brasses in boxes. Method of using air pumps for boosting pressures. Self-contained portable press

PROFILING MACHINES

Fixtures. Some Examples of Fixtures Used on Profiling Machines, J. M. Henry. Am. Mach. vol. 55, no. 26, Dec. 29, 1921, pp. 1040-1043, 11 figs. Points out that with suitable fixtures, machines may be used for many different operations and two or more operations may be performed at one setting.

PULVERIZED COAL

Air Furnaces. Apply Powdered Coal to Air Furnace, Pat Dwyer. Foundry, vol. 49, no. 24, Dec. 15, 1921, pp. 955-962, 15 figs. Malleable-iron melting furnaces and annealing ovens have been converted from hand-firing to use of powdered coal without involving radical changes in design.

Application to Boilers. Application of Pulverized Coal to Boilers, J. W. Fuller. Trans. Am. Inst. Min. & Metallurgical Engrs., no. 1106-C, 1921, 4 pp. Gives a few instances of many successful installations burning pulverized coal that were made under various types of boilers and using many fuels. Abstract of paper in Min. & Metallurgy, no. 180, Dec. 1921, pp. 35-36.

Metallurgical Furnaces. Powdered Fuel, J. S. Atkinson. Iron & Coal Trades Rev., vol. 103, no. 2805, Dec. 2, 1921, p. 802. Recent developments in connection with firing of metallurgical furnaces. Relative costs of gas firing and powdered fuel firing, cost of powdering, etc. (Abstract.) From Fuel Economy Rev.

Preparation and Combustion. The Preparation, Transportation, and Combustion of Powdered Coal, John Blizard. Canada Dept. of Mines, no. 564, 1921, 131 pp., 42 figs. Discusses distribution; feeder, mixers and burners: advantages and disadvantages; use for steam raising costs of preparing and delivering to furnace; operating and repair costs; etc.

Small-Plant System. Pulverized-Coal System for Small Plants. Power, vol. 54, no. 26, Dec. 27, 1921, pp. 1016-1017, 2 figs. System consisting of self-contained crusher and blower allows pulverized coal to be used in small plants.

Turbo Pulverizer. The Turbo Pulverizer. Iron & Coal Trades Rev., vol. 103, no. 2807, Dec. 16, 1921, p. 877, 1 fig. Describes apparatus built by The Powdered Fuel Plant Co., Ltd., Lond., which is a pulverizing mill and fan combined.

PUMPS

Mammoth. Mammoth Pumps. Eng. Progress, vol. 2, no. 12, Dec. 1921, pp. 277-278, 3 figs. Describes construction and operation of the pump and its application to raising water, chemical liquids, and solid substances that can be moved in currents of fluids.

PUMPS, CENTRIFUGAL

Parallel Operation. Operating Pumps or Fans in Parallel, J. C. Hobbs. Power, vol. 55, no. 2, Jan. 10, 1922, pp. 58-60, 6 figs. Discusses problems encountered in parallel operation of centrifugal pumps and explains why pumps must have correct characteristics.

PYROMETRY

Liquid-Fuel-Fired Boilers. Pyrometry of Boilers Fired with Liquid Fuel, E. C. Reed. Eng. & Indus. Management, vol. 6, no. 26, Dec. 29, 1921, pp. 743-746, 4 figs. Describes the Foster fixed focus pyrometer and its application. Writer claims that expense of installation of pyrometer system may be saved many times over in year.

R

RAILS

Reclaiming Worn-Out. Worn-Out Rails—Their Resurrection from Uselessness to Usefulness Raw Material, vol. 4, no. 11, Nov. 1921, pp. 392-395, 11 figs. Describes opeartions at Sweet's Steel Co.'s rail reclamation plant, Williamsport, Pa.

[illegible] Rail Manufacture, Cecil J. Allen. Ry. Engr., vol. 42, no. 503, Dec. 1921, pp. 468-470, 3 figs. Comparison of results [illegible] with rails rolled from sink-head and ordinary ingots respectively.

[illegible] Street Car Rails (L'Usure des rails de chemins de fer et de tramways), J. Gouttier. Revue Universelle des Mines, vol. 11, no. 5, Dec. 1, 1921, pp. 524-543, 12 figs. Describes Sandberg process of [illegible] and its successful application to rails.

WEAR. Causes of Premature Wear of Rails (Les causes de l'usure prématurée des rails). Le Génie Civil, vol. 79, no. 21, Nov. 19, 1921, pp. 429-433, 26 figs. Discusses cracks, fissures, segregation, etc., in rails; effect of tempering, and [illegible]

RAILWAY CONSTRUCTION

CANADA. Development of Canadian Railway Construction, H. K. Wicksteed. Can. Engr., vol. 42, no. 1, Jan. 3, 1922, pp. 104-108. Describes early trade routes and economic conditions which resulted in construction of railways in Canada. Problems solved by engineers when locating trans-continental road. Paper before Am. Assn. for Advancement of Sci.

GRADE REDUCTION. Justifying Expenditures for Grade Reductions, George J. Ray. Ry. Age, vol. 71, no. 26, Dec. 24, 1921, pp. 1243-1250, 5 figs. Shows that the construction of the Clarks Summit-Hallstead line is fully warranted by operating results. (Abstract.) Paper read before Western Soc. Engrs.

RAILWAY ELECTRIFICATION

ADVANTAGES. Railway Electrification, Vincent L. Raven. North-East Coast Instn. Engrs. & Ship-builders, advance paper, no. 3195—P for meeting, Dec. 16, 1921, 24 pp., 9 figs., partly on supp. plate. Deals with advantages which may result from substitution of electric for steam locomotive operation. See also Engineer, vol. 132, nos. 3443 and 3444, Dec. 23 and 30, 1921, pp. 673-674 and 711, 713, 5 figs., partly on supp. plate.

STEEL PLANT. Electrification of Steel Plant Railroad, R. B. Gerhardt. Iron Age, vol. 108, no. 26, Dec. 29, 1921, pp. 1663-1666. Difficulties are said to include protection of third rail from hot metal spills. Saving in cost 50 per cent. Investment offset by low operating cost. Paper presented before Assn. Iron & Steel Elec. Engrs.

SUPERPOWER PLAN. Electric Traction Proposed for 11 Railroads. Ry. Elec. Engr., vol. 12, no. 11, Nov., 1921, pp. 409-414, 9 figs. Discusses Superpower Survey report transmitted to the president containing plan providing for the interconnection of a large number of existing plants. By consolidating power supply, electric operation could be made to show saving of 14 per cent.

RAILWAY OPERATION

NORTH EASTERN RAILWAY. Surveys, Diagrams and Other Records Prepared by the Engineers Department of the North Eastern Railway, Conrad Grible. Ry. Gaz., vol. 35, no. 23, Dec. 2, 1921. pp. 841-848, 7 figs., partly on supp. plate. Line and siding diagrams as substitutes for surveys. Co-ordination of field work in measuring distances for statistical, operating and commercial purposes. Systematic recording of strength of bridges. Percentage system or recording equivalent weights of locomotive.

TRAIN DISPATCHING. Management of Single Track Lines in Great Britain (Note sur l'exploitation des lignes à voie unique dans le Royaume-Uni). Revue Générale des Chemins de Fer et des Tramways, vol. 40, no. 11, Nov. 1921, pp. 304-318, 14 figs. Discusses ticket, tablet, and token systems of train dispatching, and the various apparatus for exchanging used in connection with them.

RAILWAY SHOPS

MONTREAL, CAN. A Railroad Shop Organized for Efficiency. Machy. (N.Y.), vol. 28, nos. 4 and 5, Dec. 1921, and Jan. 1922, pp. 291-293 and 389-392, 8 figs. Description of Angus shops of Can. Pac. Ry. Co., Montreal, Canada, and equipment and methods employed.

RAILWAY SIGNALLING

[illegible] Interlockings at Jacksonville Terminal, C. J. Kelloway, Ry. [illegible] 14, no. 12, Dec. 1921, pp. 462-468, 18 figs. Developments in the construction of a large electro-pneumatic and two electro-mechanical [illegible] circuits.

RAILWAY SWITCHES

[illegible] Operated Equipment for Car Handling, R. M. Kintzing. [illegible] 79, no. 21, Nov. 19, 1921, pp. 773-775, 6 figs. Inter-[illegible]hes employed to assure proper sequence in cycle [illegible] in plant capacity secured [illegible]

[illegible] 2, Feb. [illegible] ption of road surveyed, constructed and oper- [illegible]

DEVELOPMENT 1921. Central Railroad Developments During the Year. Ry. Age, vol. 72, no. 1, Jan. 7, 1922, pp. 9-154, 89 figs. Articles on regulation of securities, labor situation, federal valuation, railroad accounts with the government, profit of railroads from lower material costs, recent tendencies in loconotive development, special types of cars introduced in 1921, maintenance-of-way, cutting freight loss and damage claims, accounting, equipment conditions, electrical developments, repair-shop and engine-house development, chronological review of year's activities. Also contains articles on railway statistics, including locomotive, freight-car and passenger-car market.

MONORAIL SUSPENDED LINE. Monorail Suspended Railroad Tracks and Canal-Boat Haulage (Système de voies suspendues monorails et système de halage des bateaux), M. Mahl. Bul. de la Société Française des Electriciens, vol. 1, no. 7, July 1921, pp. 337-368, 13 figs. Discusses a projected monorail line from Paris to Nice according to the Barmen-Elberfeld system, but with maximum speed of 300 km. per hr., also power transmission and boat haulage as side issues.

REFRACTORIES

RESISTANCE. Resistance Tests on Refractory Products under Load at Different Temperatures, V. Bodin. Quarry & Surveyors' & Contractors' Jl., vol. 26, no. 297, Nov. 1921, pp. 438-440, 3 figs. Results of tests, and table of crushing loads in kg.-cm. (Abstract.) Paper read before Ceramic Soc.

REFRIGERATING MACHINES

CARBON-DIOXIDE. Carbon-Dioxide Refrigerating Machine, H. J. Macintire. Power vol. 55, no. 1. Jan. 3, 1922, pp 24-26, 3 figs. Relative advantages of carbon dioxide *vs.* ammonia as refrigerating medium, in which pressure range, cooling-water limitations, horsepower per ton, relative size and construction are considered.

REFRIGERATING PLANTS

TEMPERATURES AND PRESSURES. Working Temperatures and Pressures in the Refrigeration Plant, W. H. Motz. Power, vol. 54, no. 26, Dec. 27, 1921, pp. 1005-1007, 3 figs. Notes on suction pressures and temperatures; discharge temperatures and pressures; use of thermometers.

RESEARCH

FAN INDUSTRY. Relation of Research to the Fan Industry. Am. Soc. Heat. & Vent. Engrs. Jl., vol. 27, no. 9, Dec. 1921, pp. 873-881. Research in the Heating and Ventilating Field, by J. I. Lyle; and Research as a Business Proposition, by F. R. Still.

ROLLING MILLS

ADJUSTABLE-SPEED MOTORS. Adjustable Speed With Motor Driven Mills, K. A. Pauly. Iron Age, vol. 108, no. 25, Dec. 22, 1921, pp. 1595-1598 and (discussion) pp. 1598-1600, 11 figs. Describes two satisfactory systems, with comments on their relative characteristics and particular work for which each is most adaptable. (Abstract.) Paper read before Engrs.' Soc. West. Pa.

CONTINUOUS. Continuous Rolling-Mills, John W. Shepherdson. Engrs.' Soc. of Western Pa. Proc., vol. 37, no. 4, May 1921, pp. 221-252 and (discussion) 253-257, 15 figs. Discusses advantages of continuous rolling process, and describes the various types of continuous mills, viz., billet mills, sheet-bar mills, wire-rod mills, mills for rolling flat finished products, merchant mills, etc.

FRICTION. Friction in Rolling Mills, William F. Parish. Iron Age, vol. 108, no. 26, Dec. 29, 1921, p. 1661. Effects of proper lubrication shown in reduced power losses. (Abstract.) Paper read before Am. Soc. Lubrication Engrs.

PRODUCTION AND YIELD. Production and Yield of Rolling Mills, Joseph F. Shadgen. Iron Age, vol. 109, nos. 1 and 2, Jan. 5 and 12, 1922, pp. 43-46 and 151-152, 1 fig. Jan. 5: Their present state of development. Useful operating data Losses which should be lessened. European practice leads in yield. Jan. 12: Dependence of material yield on oxidation and on bloom and billet cropping Temperature limitations are said to govern reheating.

SEMI-CONTINUOUS BAR. Semi-Continuous Bar Mill for Alloy Steel, F. L. Prentiss. Iron Age, vol. 109, no. 2, Jan. 12, 1922, pp. 141-144, 5 figs. Cooling equipment embodies inclined escapement and horizontal notched bed features. Flat spring steel is self-annealed in packs.

TANDEM ROLLING. Tandem Rolling of Cold-Rolled Steel. Iron Age, vol. 109, no. 3, Jan. 19, 1922, pp. 211-213, 7 figs. Special equipment developed for this purpose, including rolls and their housings, wire straighteners, edge rolls Turk's head and cross slides.

RESERVOIRS

OUTFLOW, CALCULATION OF. Computing Reservoir Outflow and Height from Inflow and Capacity, J. C. Stevens. Eng. News-Rec., vol. 87, no. 25, Dec. 22, 1921, pp. 1031-1032, 1 fig. Refers to method outlined by Prof. Pardoe in same journal (Jan. 20, 1921, p. 114). and claims that method here described is much simpler.

RIVERS

ICE GORGING. Winter Overflow from Ice Gorging on Shallow Streams, J. C. Stevens. Proc. Am. Soc. Civ. Engrs., vol. 47, no. 10, Dec. 1921, pp. 583-602, 11 figs. Deals with ice gorge occurring during coldest part of winter on streams too turbulent to permit formation of crystalline surface ice, but frazil and anchor ice are formed in such quantities that stream becomes viscuous mixture, resulting in rise of water and causing overflow. Discusses increasing flow of such streams during winter months by release of artificially stored water.

ROAD CONSTRUCTION

Handling Traffic During [illegible] Paul D. Sargent. Eng. News-Rec., vol. 88, no. 2, Jan. 12, 1922, pp. 64-65. Detouring is said to add 25 per cent [illegible] remedy.

ROAD ROLLERS

Three-Wheel Motor. Three-Wheel Water-Ballast Motor Road Roller. Engineering, vol. 112 no. 2922, Dec. 30, 1921, pp. 884-885, 6 figs. Describes new model produced by Barford & Perkins, Ltd., Peterborough, England. Nominal weight is 10 to 13 tons, and by placing engine at rear, a wheelbase of only 9 ft 9¼ in. has been obtained.

ROADS

Design. Safety and Beauty as Factors in Road Design, A. R. Hirst. Eng. & Contracting, vol. 57, no. 1, Jan. 4, 1922, pp. 20-23. Discusses fundamentals of [illegible]

Design. What 1921 Developed in Paved Road Design. Eng. News-Rec., vol. 88, bo. 2, Jan. 12, 1922, p. 61. Heavier and more reinforcement in concrete slabs. Macadam roads widened by concrete borders. Split slabs used in wider concrete roads.

[illegible] al design of rigid slab roads made possible by research conducted during two years by Division of Highways. (Abstract.) Paper read before Highway [illegible]

ROADS, CONCRETE

Testing. Variety of Movements Occur in Concrete Test Highway. Eng. News-Rec., vol. 87, no. 26, Dec. 29, 1921, pp. 1048-1051, 8 figs. Results of tests on roadway built near Pittsburg, Cal. Cracks in pavement come on crests of longitudinal waves. Edges curve up in daytime and down at night. Test continuing.

ROADS, MACADAM

Bituminous Penetration Work. 12 Years' Experience with Bituminous Penetration Work on Kansas City Boulevards and Park Roads. Fred Gableman. Eng. News-Rec., vol. 88, no. 2, Jan. 12, 1922, pp. 54-57, 2 figs. Review of practice since 1910 when oil binder was first tried on macadam roads. Asphalt now favored. Maintenance costs given.

ROCK DRILLS

Test of Drill Steel. Results of Rock Drilling Tests in the Tri-State Mining District. Eng. & Contracting, vol. 56, no. 25, Dec. 21, 1921, pp. 568-569. Account of tests conducted by Bur. of Mines co-operating with Missouri School of Mines [illegible] Results show that ⅛-in. gage changes and 24-in. changes in steel lengths are best for conditions in district under investigation when using 1¼-in. steel.

RUBBER

Stress-Elongation Curve. The Stree-Elongation Curve of Vulcanized India-Rubber, Emil Hatschek. Jl., Soc. Chem. Industry, vol. 40, no. 21, Nov. 15, 1921, pp. 251T-253T, 3 figs. Compares curves for samples of a definite rubber-sulphur mixture cured for definite lengths of time, and deduces formulas.

Testing. The Testing of Rubber Goods. U. S. Bur. of Standards Circular, no. I, 38, Sept. 28, 1921, 127 pp., 47 figs. Gives methods used at Bureau in testing of rubber goods. Describes various physical tests commonly applied and machines used for this purpose, many of which were designed in Bureau. Data are given showing effect of various factors on tensile properties of rubber. Effect of temperature on physical tests. Brief outline of methods of collecting crude rubber and processes used in manufacture of various rubber articles.

S

SCIENTIFIC MANAGEMENT

See *Industrial Management*.

SCREWS

Efficiency. Efficiency of Screws, C. D. Albert. Sibley Jl. of Eng., vol. 36, no. Jan. 1922, pp. 2-3, 1 fig. Comparison of correct and approximate expressions.

SEMI-DIESEL ENGINES

Hydroelectric Plant. A Combined Hydro and Semi-Diesel Plant at Minnedosa, Manitoba. Power, vol. 55, no. 3, Jan. 17, 1922, pp. 92-93, 2 figs. Semi-Diesel engines installed in hydroelectric plant to carry loads during periods of low water.

SEWAGE

Gas Production. Power from Sewage Gas. Engineer, vol. 132, nos. 3442 and 3443, Dec. 16 and 23, 1921, pp. 642-643 and 669-671, 5 figs. Dec. 16: Describes the W[illegible] sewage treatment system, patented in 1917, with special arrangements for production of gas from sewage, and improved method of purifying sewage. It is claimed system may be applied to various shapes and types of tanks. Dec. 23: Discusses what has been done in Australia and in England with use of this system.

SEWAGE DISPOSAL

Dewatering Sludge. Centrifuges for Dewatering Sludge, T. Chalkley. Pub. Works, vol. 51, no. 25, Dec. 17, 1921, pp. 461-464, 1 fig. Sludge used by farmers in Germany dewatered by filter presses and centrifuges, the latter different from any heretofore used in this country. Paper presented before Sanitary Eng Section, Am. Pub. Health Assn.

Marsh Gas from Sludge. Utilizing Gas from Sewage Sludge as Motive Power, John D. Watson. Eng. News-Rec., vol. 87, no. 26, Dec. 29, 1921, pp. 1062-1064. Describes experiments and experiences which are calculated to si[illegible] gas which is formed by organisms acting upon decaying vegetable and other organic substances. Discusses nature and power of this gas and shows what it can be made to do when under control. See also Can. Engr., vol. 42, no. 2, Jan. 10, 1922, pp. 127-129, 1 fig.

SHEET-METAL WORK

Elbows. New Machine Making Two Elbows a Minute. Sheet Metal Worker, vol. 12, no. 25, Jan. 6, 1922, pp. 854 and 855, 2 figs. Describes Lyon-Conklin elbow machine which turns blank sheets into elbows.

SHIPS

Ice Breakers. The Design of Ice-Breakers, Alexander Kari. Shipbldg. & Shipg. Rec., vol. 18, no. 25, Dec. 22, 1921, pp. 802-804, 4 figs. Discusses statical and dynamical ice-breaking and its application to design.

SHOVELS

Electric. Electric Shovels in Construction of Power Canal. Eng. World, vol. 20, no. 1, Jan. 1922, pp. 17-19, 5 figs. Describes advantages, including large capacity, speed of operation, reduced labor charges, continuity of operation and reliability.

SILICA BRICK

Manufacture. The Manufacture of Silica Brick, A. W. McMaster. Iron & Steel of Can., vol. 4, no. 10, Nov. 1921, pp. 267-268. Describes inauguration of the manufacture at Cape Breton from local materials. Operating costs; comparative analyses of quartzites; burning.

SLIDE RULES

Decimal Point Determination. Decimal Point Determination in Slide Rule Operation, James Theron Rood. Wisconsin Engr., vol. 26, no. 2, Nov. 1921, pp. 19-22, 3 figs. Gives examples to show how to secure greater accuracy.

SMOKE PREVENTION

Devices. The Black Smoke Problem, David Brownlie, Iron & Coal Trades Rev., vol. 103, no. 2807, Dec. 16, 1921, pp. 872-873. Causes and preventive devices; low-temperature carbonization.

STANDARDIZATION

Place of Laboratory in. The Place of the Laboratory in Standardization, W. P. Dobson. Eng. Inst. Can. Jl., vol. 5, no. 1, Jan. 1922, pp. 11-15, 6 figs. Types of engineering standards; measurement, constants, quality, performance; practice; work of laboratory in determining standards, methods employed by laboratories of Hydroelectric Power Commission of Ontario.

STEAM

Generation and Utilization. Fuel Economy by the Adoption of Scientific Management in Steam Generation and Utilization, David Brownlie. Eng. & Indus Management, vol. 6, nos. 23, 24 and 25, Dec. 8th, 15 and 22, 1921, pp. 653-656 7 figs.; 685-687, 4 figs.; and 719-722, 5 figs. Dec. 8: Feedwater heaters Dec. 15 and 22: Superheaters, and boiler and pipe covering.

STEAM-ELECTRIC PLANTS

Equipment. Rauber's Report to the Commission for Utilization of Fuels (Rapport de M. Rauber à la Commission d'utilisation des combustibles). Chaleur et Industrie, vol. 2, no. 19, Nov. 1921, pp. 727-735. Discusses steam-electric central stations, their equipment, type of boilers, superheat, economizers, feedwater heaters, etc.

STEAM ENGINES

UNAFLOW. [illegible] and Tests, L. A. Quayle. Power, vol. 55, [illegible] 17, 1922, [illegible] Universal unaflow engine exceeds grarantees on acceptance tests made after four years of continuous operation.

STEAM METERS

KENT MARINE. The Metering of Steam for Marine Purposes, also of Oil and Air, C. R. Sams. Trans. Inst. Mar. Engrs., vol. 33, Oct. 1921, pp. 375-388 and (discussion) 388-393, 10 figs. Describes the Kent steam meter which consists of an orifice carrier, cooling chambers and pressure piping, and a diagram recorder.

STEAM SHOVELS

CHANGING FROM HAND TO. Considerations in Changing a Quarry from Hand to Steam Shovel Method, Irving Warner. Eng. & Contracting, vol. 56, no. 25, Dec. 21, 1921, pp. 578-579. Discusses various local conditions and theur effect upon choice of proper equipment. (Abstract.) Paper read before Nat. Lime Assn.

STEAM TURBINES

DESIGN AND OPERATION. Major Turbine Troubles Diminished. Elec. World, vol. 79, no. 2, Jan. 14, 1922, pp. 77-80, 2 figs. Discusses blading lubrication and vibration; growth in turbine ratings; improvements in design.

STEEL

CHROME. *See Chrome Steel.*

CRUCIBLE. Comparison of American and English Methods of Producing High Grade Crucible Steel, T. Holland Nelson. Raw Material, vol. 4, no. 12, Dec. 1921, pp. 424-433, 24 figs. Discusses the merits and shortcomings of American and English practice. Presented before Am. Soc. for Steel Treating.

DEOXIDATION AND DESULPHURIZATION. Deoxidation and Desulphurization in the Heroult Furnace, F. T. Sisco. Chem. & Met. Eng., vol. 26, no. 1, Jan. 4, 1922, pp. 17-22. Describes three methods of working up a heat of steel. Discusses composition and characteristics of slags. Believes that good steel from poor scrap is a question of knowledge and skill.

ELECTRIC vs. CRUCIBLE. Crucible and Electric Tool Steel, W. J. and S. Stuart Green. Iron Age, vol. 109, no. 3, Jan. 19, 1922, pp. 201-205. Some aspects and choice in their manufacture. Points out that electric furnace bids fair to supplant crucible to greater degree than heretofore, though it is possible never completely.

HARDENING BY OVERSTRAIN. The Hardening of Steel by Overstrain, R. W. Chapman. Commonwealth Engr., vol. 9, no. 3, Oct. 1, 1921, pp. 74-75, 2 figs. Describes test showing that when steel is overstrained in tension so that its elastic limit in tension is raised, its elastic limit in compression is correspondingly lowered, and vice versa.

MANGANESE. *See Manganese Steel.*

MELTING. Leaves from a Steel Melter's Notebook, Henry D. Hibbard. Iron Age, vol. 108, nos. 17 and 21, Oct. 27 and Nov. 24, 1921, pp. 1065-1067 and 1337 and 1379-1380. Oct. 27: Experience in making hollow ingots for seamless pipe; effervescing and "killed" steel in an acid furnace. Nov. 24: Design of structure to resist shock or overstrain; car-coupler test illustrating necessity of proper distribution of metal.

MOLYBDENUM. *See Molybdenum Steel.*

ORDNANCE. Effect of Sulfur and Oxides in Ordnance Steel, William J. Priestley. Trans. Am. Inst. Min. & Metallurgical Engrs., no. 1109-S, 1921, 15 pp. 3 figs. Describes method by which desired physical properties of steel may be procured —by elimination of certain impurities that inherently exist in steel made by open-hearth process, and without use of expensive alloys. Abstract of paper in Min. & Metallurgy, no. 180, Dec. 1921, pp. 34-35. See also Iron Age, vol. [illegible] 29, 1921, pp. [illegible], 3 figs.

TUNGSTEN, METALLOGRAPHY. A Metallographic Study of Tungsten Steel (En metallografisk studie av volframstäl), Axel Hultgren. Jerkontorets Annaler, [illegible], pp. [illegible]-525, 22 figs. Discusses investigations as to transformations, critical points, free carbide, equilibrium diagrams and their significance, etc. Bibliography.

STEEL CASTINGS

[illegible] Steel Castings for Railway Rolling Stock, Ry. [illegible] 1922, [illegible] 3 figs. Describes production in [illegible] tender underframes, platform and end members for passenger rolling-stock and trailer trucks for locomotives by [illegible]

STEEL, HEAT TREATMENT OF

[illegible] for Heat Treatment of Steels [illegible]), Albert [illegible], vol. 18, no. 11, Nov. 1921, pp. 717-726 and (discussion) 727-728, 11 figs. Discusses the interdependence [illegible] state being a func- [illegible] Iron & Steel Inst., Paris.

ELEMENTS. Elements of the Heat-Treatment of Steel, H. J. French. Am. Mach., vol. 55, nos. 23, and 24, Dec. 8 and 15, 1921, pp. 907-908 and 960-964, 15 figs. Dec. 8: Operations in heat treatment; changes in structure while heating; changes produced by tempering and hardening: seasoning; effect of carburization. Dec. 15: Quenching operations; tempering.

TOOL STEEL. Volume Changes in Tool Steel on Heat Treating, L. A. Lanning. Forging & Heat Treating, vol. 7, no. 12, Dec. 1921, pp. 610-611, 2 figs. Effect of rates of heating, temperatures and quenching medium upon dimensions of cylindrical pieces of tool steels. Critical rate of heating important in hardening.

STEEL, HIGH-SPEED

HARDNESS. Hardness of High-Speed Steel. A. H. d'Arcambal. Chem & Met. Eng., vol. 25, no. 26, Dec 28, 1921, pp. 1168-1173, 8 figs. Hardness at various temperatures, hardness in the cold after various heat treatments, and cutting efficiency determined in an effort to predetermine usefulness of a modern machine tool.

Various Methods for Hardening High-Speed Steel, A. H. d'Arcambal. Chem. & Met. Eng., vol. 25, no. 25, Dec. 21, 1921, pp. 1150-1151. Discusses salt bath hardening, pack hardening, lead bath hardening, and semi-muffle furnace hardening.

METALLOGRAPHY. The Metallography of High Speed Steel, J. P. Gill and L. D. Bowman. Am. Soc. for Steel Treating Trans., vol. 2, no. 3, Dec. 1921, pp. 184-205, 56 figs. Discusses critical points and constitution of high-speed steels; secondary hardness; etching reagents, nomenclature; etc.

STEEL MANUFACTURE

BASSET PROCESS. The Basset Process (Le Procédé "Basset"). L'Outillage, vols. 235 and 236, nos. 47 and 48, Nov 24 and Dec 1, 1921, pp. 1259-1260 and 1287 1288, 1 fig. Gives copy of Basset's French patent published April 2, 1920, "Rotary furnace system for direct production of iron or steel or of pig iron," and discusses it and its prospects.

STEEL WORKS

COLD-DRAWING PLANT. LaSalle Co. Completes Cold Drawing Plant, Gilbert L. Lacher. Iron Age, vol. 109, no. 1, Jan. 5, 1922, pp. 27-31, 6 figs Designed for handling products in maximum lengths. Raw materials protected from elements.

FURNACES AND GAS PRODUCERS. Steel Works Furnaces and Gas Producers, J. S. Atkinson. Jl. West of Scotland Iron & Steel Inst., vol. 29, Part 1, Oct. Session 1921-1922, pp. 4-11 and (discussion) 11-14, 10 figs. on supp. plates. Discusses the principle of gas firing, mechanical producers, regeneration or recuperation, open-hearth furnaces, soaking pits, etc.

POWER GENERATION. Power Generation in Steel Plants, D. M. Petty. Engrs'. Club of Philadelphia Jl., vol 38-12, no. 204, Dec. 1921, pp. 392-397, 2 figs. Conclusions drawn from actual operating conditions of steel plant: Cost of power can be effectively reduced by increasing load factor; load factor in steel mills may be increased by careful arrangement of load and by supplying to central stations all surplus power not required during light load periods; etc.

STOKERS

MECHANICAL vs. HAND. Hand *versus* Mechanical Handling of Coal and Ashes in Municipal Power Plants—II, W. F. Schaphorst. Am. City, vol. 25, no. 5, Nov. 1921, pp. 415-521, 2 figs. Notes on underfeed and hand stokers, and points to be considered in selection of ash-handling system.

WOOD-REFUSE-BURNING. Burning Wood Refuse in Mechanical Stokers, R. L. Beers. Power House, vol. 15, no. 1, Jan. 5, 1922, pp. 30-33, 8 figs. Describes various types of boilers fitted with underfeed stokers for wood and other factory refuse.

STREAM POLLUTION

SEWAGE DISPOSAL AND. Stream Pollution and Sewage Disposal. Proc. Am. Soc. Civ. Engrs., vol. 47, no. 10, Dec. 1921, pp. 617-682. Symposium: Tanks and Fine Screens for Treating Sewage, George T. Hammlond. The Pollution of Tidal Harbors by Sewage with Especial Reference to New York Harbor, Kenneth Allen. Treatment of Storm-Water, John F. Skinner. Policies of the Engineering Division of the Pennsylvania Department of Health as to Public Sewerage, W. L. Stevenson. Stream Pollution and Its Control, Earle B. Phelps. Deposition of Sludges Resulting from Sewage Disposal Plants, T. Chalkley Hatton. The Dilution Factor, Langdon Pearse. Prevention of Misuse of Sewers, W. H. Dittoe. Discussion.

SUPERHEATERS

DESIGN. Steam Superheaters, Arthur D. Pratt. Steam, vol. 28, no. 5, Nov. 1921, pp. 125-127. Discusses design of superheaters and their operation.

SURVEYING

AERIAL PHOTOGRAPHY. Aerial Photography as Applied to Surveying, J. B. Mandeville. Engrs'. Soc. of Western Pa., Proc. vol. 37, no. 4, May 1921, pp. 189-206 and (Discussion) 207-220, 5 figs. Application of aerial photography in mapping; making oil and gas maps; mounting camera in airplane; etc.

T

TAYLOR SYSTEM

SHOP ORGANIZATION. An Intermediate Stage Toward the Taylor System in Shop Organization. Une étape vers le système Taylor [illegible], C. Bonnet. Arts et Métiers, vol. 74, no. 13, Oct. 1921, pp. 305-311, 5 figs. Discusses short-comings of French foreman and his gradual transformation.

TESTING MACHINES

ENDURANCE. Endurance Testing Machines, G. Shapera. Foundry Trade Jl., vol. 24, no. 276, Dec. 1, 1921, pp. [illegible] 2 figs. Describes the Krupp repeated impact machine and the Amsler wear-and-tear testing machine.

TEXTILE INDUSTRY

AUTOMOBILE MANUFACTURING METHODS APPLIED TO. Are Automobile Manufacturing Methods Applicable to the Textile Industry? Douglas T. Hamilton. Am. Mach., vol. 55, no. 25, Dec. 22, 1921, pp. 994-995. How the two industries developed. Contrasting production methods and machinery involved.

TIME STUDY

AUTOMATIC MACHINES. Modern Production Methods, W. R. Basset. Am. Mach., vol. 56, no. 3, Jan. 19, 1922, pp. 87-90, 3 figs. Time study on automatic machines. Notes on quality of labor employed, importance of standardization, rules of procedure and an example of rate setting.

MACHINE TOOLS. Modern Production Methods, W. R. Basset. Am. Mach., vol. 55, no. 26, Dec. 29, 1921, pp. 1037-1039, 1 fig. Special cases of time studies on engine lathes, surface and chucking grinding machines and semi-automatic turret lathes. Five steps in setting rates.

TRANSFORMERS

TRANSIENT VOLTAGE IN WINDINGS. Prevention of Transient Voltage in Windings, J. Murray Weed. Am. Inst. Elec. Engrs., Jl., vol. 41, no. 1, Jan. 1922, pp. 14-20, 11 figs. Relates to windings such as are used in transformers, reactors and the like, with particular reference to characteristics which determine internal distributions of suddenly impressed voltages or sudden voltage changes, and resulting internal oscillations. Explains phenomena of transient voltages as due to faulty arrangements of inherent capacity with inductance of winding.

PREMIUM WORK. Time Study for Profitable Piece Work or Premium, Samuel Theaker. Indus. Management, vol. 63, no 1, Jan. 1922, pp. 7-11, 5 figs. Discusses merits and methods of time premium work. Describes a decimal stop watch and gives examples of time study sheets.

TIRES, RUBBER

SPECIFICATIONS. Recommended Specifications for Pneumatic Tires, Solid Tires, and Inner Tubes. U. S. Bur. of Standards Circular, no. 115, Oct. 27, 1921, [illegible] pp. Revision of specifications prepared by Bureau and now used by War and Navy Departments, General Supply Committee, Post Office Department, Panama Canal and Treasury Department. Physical and chemical tests required are such that material purchased under these specifications will be satisfactory.

TRANSPORTATION

FACTORY. Analysis and Control of Factory Transportation, F. A. Pope. Factory, vol. 28, no. 1, Jan. 1922, pp. 38-42 and 72, 74, 76 and 78, 6 figs. Methods by which idle time is checked, performance records of tires and batteries best secured, daily service recorded, and final analysis of cost and performanec made by clerks without special training.

TURBO-GENERATORS

12,500-KW. 12,500 KW. Turbo-Generator for the Liverpool Corporation Electricity Works. Engineering, vol. 112, no. [illegible], Dec. [illegible], 1921, pp. [illegible] [illegible] plate. Steam turbine [illegible] constructed by Metropolitan-Vickers Elec. Co., Ltd., Manchester, England, is said to embody some very notable departures from normal type of impulse steam turbine.

V

VENTILATION

CALCULATING DUCT WEIGHTS. A Quick Method of Taking Off [illegible] Duct Work, J. J. Kojian. Sheet Metal Worker, vol 12, no. 25, Jan. 6, 1922, pp 834-835 and 838, 2 figs. Discusses method of estimating a ventilating job and shows how to develop formulas and tables.

W

WATER MAINS

TYPES. Some Observations Concerning Water-Supply Mains, J. W. Ledoux. N. E. Water Works Assn., Jl. vol. 35, no. 4, Dec. 1921, pp. 354-361, 1 fig. Consideration of various types of pipe obtainable, and discussion of concrete, wood and steel pipe as substitutes for cast iron pipe.

WATER PIPES

CORROSION. Prevention of Corrosion in Water Pipes—II. Sanitary and Heating Eng., vol. 96, no. 11, Nov. 18, 1921, pp. 315-316, 2 figs. Explains theory and operation of de-aerating de-activators as used in prevention of corrosion.

WAGES

PAYMENT BY RESULTS. Payment by Results, D. Lyon McLarty. Machinery (Lond.), vol. 19, no. 480, Dec. 8, 1921, pp. 289-291. Comparison between piecework and premium bonus systems and their application to working conditions.

JETS. Notes on Water Jets, J. A. Yates. Mech. World, vol. 70, nos. 1820 and 1825, Nov. 18 and Dec. 23, 1921, pp. 404-405 and 504-505, 3 figs. Nov. 18: Discusses relation between maximum horsepower obtainable from a jet issuing from a nozzle at end of a pipe line, length and diameter of pipe line, and supply head available. Dec. 23: Equations and calculations in connection with the efficiency of jets.

WATER POLLUTION

HARBORS. The Area of Water Surface as a Controlling Factor in the Condition of Polluted Harbor Waters, Richard H. Gould. Proc. Am. Soc. Civ. Engrs., vol. 47, no. 10, Dec. 1921, pp. 603-616, 5 figs. Discusses sources of oxygen required to meet demand of polluting matter in waters of New York harbor. It is shown that air is most imporant source of this oxygen which is obtained by direct absorption through water surface.

WATER POWER

DEVELOPMENT IN U. S. Federal Water Power Projects Up to December, 1921. Eng. News-Rec., vol. 88, no. 1, Jan. 5, 1922, pp. 24-26. Annual report of Federal Water Power Commission shows half-million horsepower under way. (Abstract.)

GREAT BRITAIN. Report of the Water Power Resources Committee. Engineer, vol 132, no. 3442, Dec. 16, 1921, p. 653. Resumé of final report of committee appointed by President of Board of Trade in 1918 to inquire into water-power resources of United Kingdom. Committee considers that in Great Britain some 210,000 kw. could be developed continuously from potential water powers at an economic rate, and for Ireland an available water power of 280,000 kw. continuous was estimated.

WORLD'S DEVELOPMENT. Study of World's Water Powers Completed. Power vol. 55, no. 1, Jan. 3, 1922, pp. 22-23. More than half of total developed water power is in North America. Africa has 190,000,000 horsepower potential water power and only 11,000 developed. Tables showing development in United States and Canada, and developed and potential water power of world in 1920 in horse-power. (Abstract.) World Atlas of Commercial Geology, issued by U. S. Geol. Survey.

WATER PURIFICATION

DEVELOPMENTS. Water Supply and Water Purification. Proc. Am. Soc. Civ. Engrs., vol. 47, no. 10, Dec. 1921, pp. 653-682. Symposium: History of Water Purification, George C. Whipple. Recent Developments in Water Filtration, Allen Hazen. Interference with Water Filtration Plant Operation by Wastes from By-Product Coke Ovens, C. A. Emerson. Recent Progress in the Reduction of the Typhoid Death Rate and Its Significance, C.-E. A. Winslow. Effect of Water Purification and Improvements in Water Supplies on the Typhoid Fever Death Rate in New York State, C. A. Holmquist. Purification of Soft Colored Waters, Robert S. Weston. Operation of Reservoirs for Water Supply, Samuel A. Greeley. Discussion.

HYDROGEN-ION CONCENTRATION. The Significance of "Hydrogen-Ion Concentration" in Water Purification, Harrison P. Eddy. N.E. Water Works Assn., Jl. vol. 35, no. 4, Dec. 1921, pp. 385-389 and (discussion) pp. 389-393. Writer enumerates advantages which may result from PH control of water purification plants, and claims there is little doubt that it will permit of a more intelligent study of water and reactions taking place during treatment.

WATER SUPPLY

DISSOLVED GASES. Dissolved Gases in Water Supplies. Chem. Age (Lond.), vol. 5, no. 129, Dec. 3, 1921, pp. 694-695. Discusses the various gases which are normally contained in natural water supplies, and describes tests employed for determining quantities in which they are present.

SANITARY PROTECTION. Sanitary Protection of Public Water Supplies, Allen Hazen. N.E. Water Works Assn. Jl. vol. 35, no. 4, Dec. 1921, pp. 297-304 and (discussion) pp. 304-308. Discusses relations between water supply and disease and what is [illegible] may be [illegible] be done to keep public water supplies from carrying disease.

WASTE PREVENTION. The Control of Water Waste by House-to-House Inspection, Gordon Z. Smith. N.E. Water Works Assn., Jl. vol. 35, no. 4, Dec. 1921, pp. 322-325 and (discussion) pp. 325-334. Describes inspection service of Bridgeport Hydraulic Co. serving water to city of Bridge port and neighboring towns.

WELDING

See Autogenous Welding; Electric Welding, Arc; Electric Welding, Resistance; Oxy-Acetylene Welding;

WIND TUNNELS

GÖTTINGEN, GERMANY. Göttingen Wind Tunnel for Testing Aircraft Models, Prandtl. Aerial Age Weekly, vol. 14, nos. 13 and 14, Dec. 5 and 12, 1921, pp. 298-299 and 302 and pp. 324-326, 9 figs. Depends on government and scientific societies for financial support. Describes equipment and operation. Designed for an air speed of 54 m/sec. with maximum of 60 m/sec. corresponding to an air efficiency of about 800 hp. From Zeit. für Flugtechnik und Motorluftschiffahrt

RESEARCH. The Scope of Wind Tunnel Research, E. N. Fales and F. W. Caldwell. Aerial Age Weekly, vol. 14, nos. 11 and 12, Nov. 21 and 28, 1921, pp. 248-250 and 270-272, 11 figs. Nov.21: Discusses extension and importance of aeronautical research and civil engineering problems in construction of wind tunnels. Nov. 28: Desirable characteristics; first cost; freedom from velocity fluctuations; suitability of existing tunnels for attainment of desirable characteristics, etc.

WIRE ROPE

STANDARD SPECIFICATION. Standard Specification for Wire Rope. Contract Rec., vol. 36, no. 1, Jan. 4, 1921, pp. 13-16. Canadian Engineering Standards Assn. drafts code covering wire rope mining, dredging and steam-shovel purposes.

WOOD

INFECTED. The Chemical Changes Involved during Infection and Decay of Wood and wood Pulp. Mark W. Bray and Joseph A. Staidl. Jl. Indus. & Eng. Chem., vol. 14, no. 1, Jan. 1922, pp. 35-40, 1 fig. Concludes that in all cases infected woods produce less pulp per unit weight of wood than sound woods. Paper read before Am. Chem. Soc.

WOODWORKING MACHINES

PLANES, NEW TYPES OF. Old and New Types of Planes, Oskar Spohr. Eng. Progress, vol. 2, no. 12, Dec. 1921, pp. 265-267, 12 figs. Compares old and new rabbet planes, describing the greatly improved features.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director
Engineering Societies Library,
29 West Thirty-ninth Street New York, N.Y.

A

ABRASIVES

PROPERTIES AND USES. Grinding Wheels. Les Meules Artificielles, E. Assié. Arts et Métiers, vol. 74, no. 12, Sept. 1921, pp. 265-270, 7 figs. Discusses abrasives, carborundum, corundum, melting points, resistance to acid, use as refractories, etc.

ACCOUNTING

PIG-IRON PRODUCTION. Accounting for Pig Iron Production, Nathaniel B. Bergman. Jl. of Accountancy, vol. 33, no. 2, Feb. 1922, pp. [illegible]. Discusses blast-furnace operations and how to deal with them in accountancy.

AERONAUTICS

RESEARCH. Aeronautic Research, Joseph S. Ames. Jl. Franklin Inst., vol. 193, no. 1, Jan. 1922, pp. 15-28, 17 figs. Describes types of investigations in progress in aeronautics and methods pursued with especial reference to wind-tunnel experiments.

AIR CONDITIONING

AERO-HYDRO-FAN-SEPARATOR. Improvements in the Process for Drying and Cleaning Air Mechanically, William J. Baldwin. Am. Soc. Heat. & Vent. Engrs. Jl., vol. 28, no. 1, Jan. 1922, pp. 49-52, 1 figs. Describes recent improvements made in fan known as an aero-hydro-fan-separator, for washing, drying and conditioning air.

AIR DRYING. The Volume of Air Required in Air Drying, C. T. Mitchell. Chem. & Met. Engr., vol. 25, no. 24, Dec. 14, 1921, pp. 1088-1090, 3 figs. Factors affecting atmospheric evaporation, cooling of air during evaporation, distinction between wet bulb temperature and dew point, calculation of volume of air required; etc. Charts for 100, 85, and 70 per cent ultimate humidity.

INDUSTRIAL EFFICIENCY AND. The Influence of Atmospheric Conditions on Industrial Efficiency, H. M. Vernon. Eng. & Indus. Management, vol. 6, no. 26, Dec. 29, 1921, pp. 749-751, and vol. 7, no. 1, Jan. 5, 1922, pp. 12-13. Dec. 29: Notes on estimation of air movement; the best temperature; question of humidity; effect on accidents. Jan. 5: Influence of atmospheric conditions on health; bacterial infection necessity for adequate remedies. Lecture delivered before Royal Inst. Pub. Health.

AIRCRAFT

ARMAMENT LIMITATION CONFERENCE. Text of the Conference Discussion on Aircraft. Aerial Age Weekly, vol. 14, no. 21, Jan. 30, 1922, pp. 490-492. Text of official communiqué issued by Conference on Limitation of Armament dealing with discussion of aircraft in session of Committee on Limitation of Armament.
The Washington Conference and Aircraft. Aviation, vol. 12, no. 5, Jan. 30, 1922, pp. 128-132. Report of Sub-committee on limitation of aircraft as to numbers, character and use.

MAINTENANCE. Canadian Technical Memoranda. Aviation, vol. 12, no. 4, Jan. 23, 1922, pp. 105-106. Copy of technical memoranda issued by Canadian Air Board, on aircraft maintenance.

STRENGTH OF GREAT POWERS. Air Strength of the Great Powers. Aviation, vol. 12, no. 6, Feb. 6, 1922, pp. 164-166. Tables prepared by sub-committee on aircraft of Washington Conference giving authorized and actual air strength data for United States, France, Great Britain, Italy and Japan.

WIRE CABLE, ELASTICITY OF. A Study of the Elastic Properties of Small-Size Wire Cable, R. R. Moore. Mech. Eng., vol. 44, no. 2, Feb. 1922, pp. 105-106 and 111. Results of series of tests carried out at McCook Field, Dayton, Ohio, in whcih it is shown that modulus of elasticity of small-sized wire aircraft cable varies from 15,000,000 to 28,000,000, depending upon size and type of cable. It was also found that modulus of elasticity may be raised by loading cale below elastic limit and that resting the cable does not seem to have any definite effect on modulus.

AIRPLANE ENGINES

TESTS. British Tests for Aircraft Engines, Aerial Age Weekly, vol. 14, no. 19, Jan. 16, 1922, pp. 438-439. Gives schedule of standard tests to determine airworthiness of aircraft engines, issued by British Air Ministry.

AIRPLANE PROPELLERS

THRUST AND TORQUE CHARACTERISTICS. Tests on Air Propellers in Yaw, W. F. Durand and E. P. Lesley. Nat. Advisory Committee for Aeronautics Report, no. 113, 1921, 37 pp. 26 figs. Results on tests to determine thrust (pull) and torque characteristics of air propellers in movement relative to air in a line oblique to line of shaft, and specifically when such angle of obliquity is large, as in cast of helicopter flight with propeller serving for both sustentation and traction.

AIRPLANES

BRITISH. Aeronautics in 1921, Engineer, vol. 133, no. 2445, Jan. 6, 1922, pp. 18-21, 13 figs. partly on supp. plate. Review of British airplanes constructed during year.

COMMERCIAL. The "Bristol" 10-Seater Commercial Aeroplane. Flight, vol. 14, no. 3, Jan. 19, 1922, p. 39, 1 fig. 400-hp. Bristol "Jupiter" engine; speed at ground level, 112 m.p.h., speed at 5,000 ft., 110 m.p.h.
The D.H. Type 34 Commercial Biplane. Flight vol. 14, no. 1, Jan. 5, 1922, p. 4, 3 figs. 450-hp. Napier "Lion" engine; wing area, 590 ft.; weight, empty, with water, 3365 lb.; useful load, 10 passengers, 2000 lb. freight, 80 gal. petrol; cruising speed, 105 m.p.h.

PARIS SHOW. Seventh International Exposition of Aerial Locomotion (VII Exposition internationale de locomotion aérienne) André Lesage. Génie Civil, vol. 79, nos. 22, 23 and 24, Nov. 26, Dec. 3 and 10, 1921, pp. 464-468, 477-485 and 510-515, 41 figs. Discusses exhibit of French official services, materials, testing laboratories, French meteorological and aerial navigation service. describes different types of airplanes and airplane engines exhibited.

RIB FORMS, STRENGTH OF. The Strength of Airplane Rib Forms, D. T. Brown and R. J. Diefenbach. Mech. Eng., vol. 44, no. 2, Feb. 1922, pp. 110.111. Description of investigation to determine strength of plywood webs, with lightening holes arranged as in airplane ribs.

ALLOY STEELS

FAILURE, DUE TO INTERNAL STRESS. The Failure of Metals Through the Action of Internal Stress Irregularities with Special Reference to Tool Steels, J. Neill Greenwood. Faraday Soc. Trans., vol. 17, part 1, no. 49, Dec. 1921, pp. 123-138, 6 figs. Investigation of basic reasons for failures and measures for minimizing their occurrences. Bibliography.

ALLOYS

ALUMINUM. *See Aluminum Alloys.*

COPPER. *See Copper Alloys.*

IRON. *See Iron Alloys.*

ALUMINUM

BRITTLENESS OF. Brittleness Developed in Aluminum and Duralumin by Stress and Corrosion, Henry S. Rawdon, Alexander I. Krynitsky and Julius F. T. Berliner. Chem. & Met. Eng., vol. 26, no. 4, Jan. 25, 1922, pp. 154-158, 13 figs. Aluminum is deeply corroded where impurities lodge between primary grains, but, if recrystallized, is not embrittled; duralumin is subject to true intercrystalline embrittlement, but intensified by corrosion and stress.

ALUMINUM ALLOYS

DIE CASTING. Aluminum and Its Alloys—VI, F. A. Livermore. Metal Industry (Lond.), vol. 20, no. 2, Jan. 13, 1922, pp. 25-29, 7 figs. Deals with aluminum alloy die casting.

AMALGAMS

LOW-TEMPERATURE DISTILLATION. Low-Temperature Distillation of Amalgams of Bituminous Non-coking Coal and Asphaltic Oils, Joseph D. Davis, and C. E. Coleman. Am. Gas Jl., vol. 116, no. 4, Jan. 28, 1922, pp. 83-86, 1 fig. Describes experiments in distilling mixtures of coal and oil for production of coke. Main points investigated are quantity and quality of coke, quantity of oils boiling below 221 deg. cent. and oils boiling at 221 to 300 deg. cent., and quantity and quality of gases.

AMMONIA

SYNTHESIS OF. Synthesis of Ammonia (La recherche scientifique, ses applications à l'industrie et la synthèse industrielle de l'ammoniaque), Georges Claude. Revue Générale des Sciences, vol. 32, nos. 19 and 20, Oct. 15 and 30, 1921, pp. 534-543 and 570-581, 10 figs. Oct. 15: Difficulties of scientific research, its resources, etc.; manufacture of hydrogen, chlorine, helium, neon, etc. Oct. 30: Describes equipment and operations at Montereau Ammonia Extraction works working at a pressure of 1,000 atmos.

AMMONIA COMPRESSORS

STARTERLESS INDUCTION MOTORS FOR. Starterless Induction, Motors for Ammonia Compressors, J. Lebovici. Ice & Refrigeration, vol. 62, no. 1, Jan. 1922, pp. 24-25. Describes starterless motor, combining favorable characteristics of squirrel-cage and slip-ring types, making an ideal drive for ammonia compressors using up to 150-hp. Paper read before Nat. Assn. Practical Refrig. Engrs.

APPRENTICES, TRAINING OF

PLANT VS. CONTINUATION SCHOOLS. The Training of Workers in Manufacture, J. V. L. Morris. Am. Mach., vol. 56, no. 7, Feb. 16, 1922, pp. 249-251. General conditions of apprenticeship; problems arising from school; plant school vs. part-time and continuation schools.

ARCHES

CIRCULAR. The Circular Arch under Normal Loads. Am. Soc. Civ. Engrs. Proc., vol. 48, no. 1, Jan. 1922, pp. 91-98, 1 fig. Discussion by B. F. Jakobsen of paper by William Cain published in same journal (Dec. 1921).

AUTOMOBILE ENGINES

AIR-COOLED. Air-Cooling Systems: Past, Present and Future. Autocar, vol. 28, no. 1369, Jan. 14, 1922, pp. 47-50, 7 figs. Gives concise summary of the various points for and against use of air-cooled engines for small cars; directions in which developments must tend.

CYLINDERS. Cylinders for the Mack Motor, Fred. H. Colvin. Am. Mach., vol. 56, no. 5, Feb. 2, 1922, pp. 173-174, 7 figs. Fixtures, trams and gages for locating cylinder from bore. Inspection methods which secure results. Volume of compression chamber tested by liquid gage.

Operations on the Cylinders of the Wills Sainte Claire, Fred H. Colvin. Am. Mach., vol. 56, no. 5, Feb. 9, 1922, pp. 216-218, 12 figs. Closed end cylinders require special tools for machining combustion chambers. Special boring machine with inclined spindles. Heat-treatment removes strains.

NEW YORK SHOW. Powerplant Trends as Seen at the Show, Herbert Chase. Automotive Industries, vol. 46, no. 2, Jan. 12, 1922, pp. 62-65, 3 figs. Discusses cooling systems, aids to starting, lubrication and piston design, valves, gearing and crankshafts, etc.

PEUGOT-TARTRAIS DIRECT-INJECTION. Peugeot To Produce Automotive Injection Engine, W. F. Bradley. Automotive Industries, vol. 46, no. 6, Feb. 9, 1922, pp. 269-271, 11 figs. Said to be capable of using any liquid fuel; two-stroke cycle; develops 50-hp. at 1250 r.p.m.; weight, 550 lbs.; uses 0.397 lb. fuel per hp. hr. at full load and 0.484 lb. at quarter load. See also Commercial Ve-[illegible] 1, Feb. 1, 1922, p. 31, 3 figs.

TWO-STROKE CYCLE. The Two-Stroke Motor Car Engine, F. W. Lanchester and R. H. Pearsall. Engineering, vol. 133, nos. 2925 and 2926, Jan. 20 and 27, 1922, pp. 90-92 and 122-124, 16 figs. Investigation of principal factors controlling [illegible] Paper read before Instn. Automobile Engrs.

AUTOMOBILES

BRAKES. Automobile Brakes, Sydney V. James. Armour Engr., vol. 13, no. 1, Nov. 1921, pp. 1-21, 9 figs. Discusses mechanics of motion as applied to brakes and braking, actual brake mechanisms and typical braking systems, [illegible] internal expanding types, and brake [illegible]

FRONT-AXLE STUBS. Machining Automobile Front Axle Stubs, F. Hickling. Machy. (Lond.), vol. 19, no. 487, Jan. 26, 1922, pp. 497-499, 7 figs. Discusses layout for a particular type of stub, which has been in use for over two years, on a [illegible]

GEAR BOXES. Notes on Motor Car Gearboxes, H. F. L. Orcutt. Automobile Engr., vol. 12, no. 159, Jan. 1922, pp. 22-30, 7 figs. Discusses principal defects relating to design, workmanship and material. Describes gear-tooth grinding process. [illegible] Automobile Engrs.

MANUFACTURE. Cars in the Making. Autocar, vol. 47, nos. 1365, 1366 and 1367, Dec. 17, 24 and 31, 1921, pp. 1254-1255, 1289-1291 and 1341-1343, 18 figs. Dec. 17: Practical working out of designs by experimental work. Dec. 24: Describes methods by which raw materials are worked up into forms suitable for economic processes of machine-shop production. Dec. 31: Deals with preparation of tools and jigs, and explains methods of using lathe to secure interchangeability of parts.

NEW YORK SHOW. Trends in Chassis Design at the New York Show, P. M. Heldt. Automotive Industries, vol. 46, no. 2, Jan. 12, 1922, pp. 58-62, 8 figs. Discusses various improvements, including changes in clutch, transmission locks, gear shifting, and steering wheel.

REPAIR-SHOP PRACTICE. Automobile Repair-Shop Practice. Machinery (Lond.), vol. 19, no. 485, Jan. 12, 1922, pp. 445-447, 4 figs. Describes methods and equipment commonly employed in automobile repair-shop practice.

SERVICE EQUIPMENT. Automotive Service Methods and Equipment, Howard Campbell. Am. Mach., vol. 56, no. 4, Jan. 26, 1922, pp. 125-127, 11 figs. Tools used for servicing Hudson and Essex Cars. Fixtures for testing and straightening. Attachments for lapping pistons and cylinders.

AVIATION

COMMERCIAL. Air Lines and Some of Their Problems, R. B. C. Noordnyn. Mech. Eng., vol. 44, no. 2, Feb. 1922, pp. 107-109 and 111. Detailed account of progress of commercial aviation in Europe, tracing development from time of post-war experimental work with military machines and fields, to present successful operation with proper machines and schedules and with Government subsidies.

FRENCH CIVIL TRANSPORT. French Progress in Civil Air Transport, M. de Lavergne. Aviation, vol. 12, no. 6, Feb. 6, 1922, pp. 170-171. In three years French merchant air fleet expanded from 46 airplanes to 258, all of which are used on regular transport services.

B

BEARINGS, BALL

DESIGN AND PERFORMANCE. Ball and Roller Bearings: Their Design and Performance. A. W. Macaulay. Engineering, vol. 113, no. 2925, Jan. 20, 1922, p. 87, 6 figs. Points out that principal conditions which bearing must fulfill are (1) capacity for taking combined radial and thrust load; (2) self-contained unit having no loose parts, and without necessity of any adjustment; (3) high fatigue limit; (4) lowest possible friction; (5) absence of vibration. (Abstract.) Paper read before Instn. Engrs. & Shipbuilders in Scotland.

BLAST FURNACES

HOT-BLAST STOVE RATING. Hot Blast Stove Rating, F. H. Willcox. Blast Furnace & Steel Plant, vol. 10, no. 1, Jan. 1922, pp. 29-32. Actual test data showing effectiveness of hot blast stove equipment as applied to a 600-ton blast furnace.

REBUILT. Rebuilds Stack on Historic Site Richard Peters, Jr. Iron Trade Rev., vol 70, no. 5, Feb. 2, 1922, pp. 325-328, 5 figs. Furnace succeeding famous Warwick unit has been replaced, work involving construction of new stack, top and downcomers. New Blast furnace has skip bridge with independent shear leg support.

BLOWERS

ROOTS. Hints on Repairing Roots Blowers, F. R. Parsons. Mech. World, vol. 71, no. 1830, Jan. 27, 1922, pp. 64-65, 3 figs. Maintenance and efficient upkeep of Roots pressure blowers; sources of trouble and suggested remedies; lubrication and belt troubles.

TURBO. Turbo-Boosters and Exhausters for Town Gas. Engineering, vol. 133, no. 2926, Jan. 27, 1922, pp. 105-106, 8 figs., partly on p. 108. Deals with some of later developments by The Bryan Donkin Co., Ltd., Chesterfield, England, partictlarly the Rateau turbo-blowers and fans.

BOILER EXPLOSIONS

CAUSES. A New Boiler Explosion, G. W. Atkinson. Power, vol. 55, no. 6, Feb. 7, 1922, pp. 206-207, 3 figs. Leakage near flange of bumped head led to investigation which disclosed dangerous crack. Breathing of head probable cause.

BOILER OPERATION

AUTOMATIC DRAFT REGULATION. Automatic Draft Regulation in Steam Boiler Rooms (La régulation automatique du tirage dans les chaufferies de générateurs à vapeur), Jean Delestrade. Technique Moderne, vol. 13, no. 12, Dec. 1921, pp. 510-518, 14 figs. Describes complete operation of a battery of four Babcock boilers, of which one is auxiliary, producing 10,000 kg. steam per hr. at 14.5 kg. pressure.

CO_2 VALUES, INTERPRETING. Effect of Coal on Excess Air in Boiler Operation, Hugh R. Carr. Power Plant Eng., vol. 26, no. 2, Jan. 15, 1922, pp. 112-114, 2 figs. Considerations to be taken into account in interpreting CO_2 values with different kinds of coal.

EFFICIENT. The Necessity for and Savings Possible with Better Boiler-Room Operation. C. W. DeForest. Power, vol. 55, no. 4, Jan. 24, 1922, pp. 139-141, 3 figs. Deals with cost of fuel, organization, boiler-room instruments and records. (Abstract.) Paper read before Stoker Mfrs. Assn.

BOILER PLANTS

Ford Motor Co. Power House. A large American Power Plant. Eng. Production, vol. 4, nos. 68 and 69, Jan. 19 and 26, 1922, pp. [illegible] figs. Details of boiler equipment of Ford Motor Co. (Abstract.) Paper presented to Engrs. Soc. West Pa., by George T. Ladd, with [illegible] by H. [illegible] Savage and J. R. Le Valley.

Valuation. Valuation of the Boiler Plant, Allen F. Brewer. Combustion, vol. 6, no. 2, Feb. 1922, pp. [illegible]. Notes [illegible] estimation salvage and service values.

BOILERS

Capacities. Boiler Capacities Obtainable per Cubic Foot of Furnace Volume, T. B. Stillman. Power, vol. 55, no. 5, Jan. 31, 1922, pp. 171-173, 3 figs. Detailed test results on boilers operating at as high as 658.9 per cent rating. In one case 2285 lb. of oil was burned per hr. per burner. Paper presented before Assn. Edison Illuminating Companies.

Locomotive. *See Locomotive Boilers.*

Marine. *See Marine Boilers.*

BOILERS, WATER-TUBE

Marine. A New Water-Tube Boiler For Merchant Ships. Mar. Engr. & Naval Architect, vol. 45, no. 532, Jan. 1922, pp. 10-11 and 40, 2 figs. Describes the Hawthorn-Armstrong patent boiler in which an effort had been made to combine in one unit a steam generator suitable for use in merchant ships and to provide a high degree of superheat.

BORING MACHINES

Machining Locomotive Brasses. Machining Locomotive Brasses on Boring Mill, J. H. Moore. Can. Machy., vol. 27, no. 2, Jan. 12, 1922, pp. 17-19, 9 figs. Importance of proper fixtures if maximum production is to be attained. Describes machining of a 9-in. globe valve.

BRAKES

Freight-Train Vacuum. Railway Brakes for Heavy Traffic. Engineering vol. 113, no. 2924, Jan. 13, 1922, p. 43. Abstracts of two papers read before Instn. Civ. Engrs., entitled, Control of Trains Considered in Relation to Increase of Weight and Speed. Combined with reduced Headway, by Alan Wood Rendell; and Trials in Connection with the Application of the Vacuum Brake for Long Freight Trains, Henry Fowler and Herbert N. Gresley.

BRASS

British Industry. Modern Developments in the British Brass Industry, Ernest T. Smith. Can. Chem. & Metallurgy, vols. 5 and 6, nos. 12 and 1, Dec. 1921 and Jan. 1922, pp. 345-348 and 8-12. Discusses extent to which existing scientific and technical knowledge has been utilized in British brass industry as a whole and describes development resulting from its utilization. Melting and foundry practice; electric furnaces; extrusion of brass; hot pressing and forging; rolling-mill practice; annealing; composition of brasses and special alloys; research and its organization. Paper read before Am. Electrochem. Soc.

Rod. Modern Methods of Making Brass Rod. Brass World, vol. 18, no. 1, Jan. 1922, pp. 3—4, 9 figs. partly on pp. 5—7. Describes development of extrusion process and present-day extrusion machines.

Season Cracking. The Prevention of Season Cracking in Brass by the Removal of Internal Stress, H. Moore and S. Beckinsale. Faraday Soc. Trans., vol. 17, part 1, no. 49, Dec. 1921. pp. 162-192, 22 figs. Reduction of stress by low-temperature annealing was studied in 70:30 brass cold rolled to 120, 160, and 200 Brinell hardness, in elastically bent test-strips of each hardness, initally stressed to 11, 17, and 22 tons per sq. in. maximum tension at surface. Results are presented in tables and summarized.

BRIDGE PIERS

Bascule-Bridge. Burlington Bridge, Near Hamilton, Involved Difficult Foundation Problems, F. W. Paulin. Contract Rec., vol. 36, no. 6, Feb. 8, 1922, pp. 125-126, 3 figs. Strauss bascule span replaces swing structure. Presence of sand for depth of 100 ft. made extensive piling necessary. Sheet steel cofferdam enclosed pier sites. Continuous pumping to keep water down.

BRIDGES, HIGHWAY

Reinforced-Concrete. Some Features of the Chemung River Concrete Bridge. Eng. News-Rec., vol. 88, no. 5, Feb. 2, 1922, pp. 188-192, 9 figs. Construction details of seven-arch bridge at Corning, N.Y. All parts of bridge are reinforced concrete poured in place even to foundation piles and lamp posts on parapets. Notes on reinforcement interlocking, waterproofing details and flood protection of plant.

Steel. New Road Bridge Opened Over Sixteen Mile Creek, T. D. Mylrea. Can. Engr., vol. 42, no. 6, Feb. 7, 1922, pp. 203-205, 7 figs. Said to be longest bridge yet constructed on provincial highways. 85 ft. steel truss span with 16-ft. roadway. Superstructure consists of concrete floor carried upon 8 spans of lattice trusses.

BRIDGES, RAILWAY

Impact Tests. English Impact Measurements Analysed, F. E. Turneaure. Eng. News-Rec., vol. 88, no. 3, Jan. 19, 1922, pp. 104-106. Significance of results and comparison with Am. Ry. Eng. Assn. tests. Deficiency of observed live-load stresses. Influence of secondary stresses. Impact on short spans.

Strength. The Strength of Old Railway Bridges, Conrad Gribble. Ry. Gaz., vol. 35, no. 27, Dec. 30, 1921, pp. 995-996 and 999. Unknown factors which affect stresses. Necessity for scientific experimental work.

BRONZE

Manganese. Manganese Copper, Jesse L. Jones. Metal Industry (N.Y.), vol. 20, no. 1, Jan. 1922, p. 7. Discusses its use in manufacture of manganese bronze, and methods of obtaining best results.

BUILDING LAWS

Ideal Codes. Building Codes, R. Fleming. Eng. & Contracting, vol. 57, no. 4, Jan. 25, 1922, p. 88. Discusses essentials of an ideal building code. (Abstract.) Paper read before Engrs. Club of Trenton, N.J.

Standardization of Codes. Standardization of Building Codes. Contract Rec., vol. 36, no. 6, Feb. 8, 1922, pp. 135-137. Suggested outline for civic building by-law drawn up by Assoc. Gen. Contractors of America, that aims to simplify and unify requirements.

C

CABLES, ELECTRIC

Lead Sheathing, Failure of. Failure of the Lead Sheathing of Electric Cables, L. Archbutt. Faraday Soc. Trans., vol. 17, part 1, no. 49, Dec. 1921, pp. 22-35, 22 figs. Results of inspection of cables used in connection with automatic signalling and other cables. In writer's opinion, peculiar types of structure observed in several of the defective sheaths is developed in process of extrusion and cable makers shou d investigate to discover conditions which give rise to it.

CABLEWAYS

Aerial. Automatic Aerial Tramway. Rock Products, vol. 25, no. 3, Feb. 11, 1922, pp. 26-27, 2 figs. Tramway at Clinchfield Products Corp.operating a barytes mine at Evington, Va., is reversible; hauls both coal and ore.

Track Cables. Tensions in Track Cables and Logging Skylines, Samuel Herbert Anderson. University of Washington Eng. Experiment Station Bul., no. 13, June 1921, 27 pp., 5 figs. Deals with problem of catenary loaded at one point. Equations are derived and properties of such catenary discussed. It is shown how tensions may be computed and what the condition is for maximum tension.

CAR LIGHTING

Electric. Electric Illumination for Trains, Richard Hanchen. Eng. Progress, vol. 3, no. 1, Jan. 1922, pp. 1-3, 6 figs. Notes on continuous electric train lighting for individual cars; drive of dynamo; voltage control; charging and life of battery; etc.

Principles of Car Lighting by Electricity—XVII, Charles W. T. Stuart. Ry. Elec. Engr., vol. 13, no. 1, Jan. 1922, pp. 9-17, 15 figs. Describes the Gould simplex system of car lighting, consisting of a generator driven by a belt from car axle, a generator regulator panel, a lamp regulator panel mounted in a cabinet inside or under car body, and a storage battery suspended in a box under car body.

CAR WHEELS

Machining. Correct Machining and Mounting of Wheels and Axles and the Necessity for Carefully Measuring Axles Removed from Cars so that Proper Credits can be Allowed, Chas. Petran. Official Proc. of Car Foremen's Assn. of Chicago, vol. 17, no. 3, Dec. 1921, pp. 16-29 and (discussion) 30-57, 3 figs. Discusses boring of cast iron wheels; fitting wheels to axles; wheel mounting pressure nad its automatic registration; instructions to guard against wrong inspection of axles; rolled-steel wheels; etc.

Manufacture. Wheels for Railway Rolling-Stock. Ry. Gaz., vol. 35, no. 27, Dec. 30, 1921, pp. 1000-1002, 6 figs. Describes new process of manufacturing wheel centers of the solid disk type.

Steel-Tired. Cast-steel and Steel-tyred Wheels, H. W. Mellor. Machinery (Lond.), vol. 19, no. 486, Jan. 19, 1922, p. 479, 4 figs. Suitable thickness for steel tires, and rims for steel wheels.

Sandberg Sorbitic Steel for Tyres. Ry. Gaz., vol. 35, no. 27, Dec. 30, 1921, pp. 991-992 and 999, 6 figs., partly on p. 993. Improvements due to Sandberg process which add considerably to capacity of rolling stock and reduce occupancy of repair shops. See also Ry. Engr., vol. 43, no. 504, Jan. 1922, pp. 16-17 and 35, 6 figs.

CARS

Hose Connectors. Recent Changes in American Hose Connectors. Ry. Age., vol. 72, no. 6, Feb. 11, 1922, pp. 375-377, 4 figs. Describes connector manufactured by Am. Automatic Connector Co., Cleveland, Ohio, and Tests made.

Reclaiming Metal Roof Sheets. Reclaiming Sheets of Outside Metal Car Roofs. Ry. Age, vol. 72, no. 4, Jan. 28, 1922, pp. 275-276, 4 figs. Savings in car repair costs are result of moderate expenditures for facilities.

CARS, PASSENGER

Articulated Dining. Articulated Units Feature Recent English Car Design. Ry. Rev., vol. 70, no. 4, Jan. 28, 1922, pp. 109-113, 6 figs. Describes new dining-car train, showing advantages of articulated design and use of electricity for cooking.

Sleeping and Compartment. New Sleeping and Compartment Cars for the C.P.R. Ry. Rev., vol. 70, no. 3, Jan. 21, 1922, pp. 77-81, 8 figs. Designed for service on transcontinental trains with special regard for comfort of women travelers.

CASE-HARDENING

Charcoal Carbonization. Carbonization With Wood Charcoal, H. Schagrin. Am. Soc. for Steel Treating Trans., vol. 2, no. 4, Jan. 1922, pp. 331-335 and (discussion) 335-338, 12 figs. Discusses tests made with drop forgings of acid bessemer steel which showed that charcoal was cheap and satisfactory casing material.

CAST IRON

Hardness Tests. Mechanical and Elastic Properties of Cast Iron and the Use of the Ball Hardness Test (Caractéristiques méchaniques et élastiques des fontes et utilisation de l'essai à la bille), Albert Portevin. Revue de Métallurgie, vol. 18, no. 12, Dec. 1921, pp. 761-779, 19 figs. Discusses tests required by French artillery for steeled iron shells, including elongation, compression and hardness.

Malleable. American Malleable Cast Iron, H. A. Schwartz. Iron Trade Rev., vol. 70, nos. 5 and 6, Feb. 2 and 9, 1922, pp. 335-341 and 410-411, 14 figs. Mechanical effects of plastic deformation.

Malleableizing of White Cast Iron, Arthur Phillips and E. S. Davenport. Am. Inst. Min. & Metallurgical Engrs. Trans., no. 1117-S, 1922, 23 pp., 49 figs., and (in abstract) Min. & Metallurgy, no. 181, Jan. 1922, pp. 31-32. Presents data and observations resulting from series of experiments dealing with heat treatment and microstructure of commercial white cast iron and its derivative, malleable iron.

Synthetic. Manufacture of Synthetic Cast Iron in the Electric Furnace, W. L. Morson. Chem. & Met. Eng., vol. 26, no. 7, Feb. 15, 1922, pp. 312-316. Production on Pacific coast: detrimental effects of excessive dry slags; comparative operating costs.

CASTINGS

Automobile. British Motor Castings Methods—III, Ben Shaw and James Edgar. Foundry, vol. 50, no. 3, Feb. 1, 1922, pp. 103-107, 23 figs. Making of patterns and coreboxes for a typical crankcase casting; detail and reasons for methods recommenced.

CENTRAL STATIONS

Operating Expenses. Operating Expenses of Six Plants. Elec. World, vol. 79, no. 3, Jan. 21, 1922, pp. 131-132. Study of Massachusetts stations emphasizes advantages of electrical equipment from upkeep standpoint. Data indicate changes which are taking place as result of transition to new industrial basis.

Superpower, France. The Superpower Station at Gennevilliers (La supercentrale de Gennevilliers), L. D. Fourcault. Technique Moderne, vol. 13, no. 12, Dec. 1921, pp. 525-527, 9 figs. partly on supp plate. Describes civil engineering work, including foundations, especially for machines.

CHROME STEEL

Properties. Chromium Steels and Irons. Leslie Aitchison. Automobile Engr., vol. 11, no. 158, Dec. 1921, pp. 453-458, 5 figs. Discusses the three main advantages of alloy steels as against carbon steels, viz., high tensile strength, high toughness, ease in hardening and homogeneity in resulting product. Mechanical properties of chromium steels and irons. Paper read before Instn. Automobile Engrs.

CHROME-NICKEL STEEL

Krupp Rustproof. Krupp Rustproof Steel, Fritz Huth. Mech. Eng., vol. 44, no. 2, Feb. 1922, pp. 120-121. Developed as result of investigations carried out at establishment during years 1909 to 1914 on corrosion of steel and belonging to class of chrome-nickel steels. Translated from Metall-Technik, vol. 47, Nov. 1, 1921, p. 123.

CLUTCHES

Pomini Friction. The Pomini Friction Clutch. Engineering, vol. 113, no. 2925, Jan. 20, 1922, pp. 70-71, 32 figs. Partly on supp. plate. Describes clutch constructed by Societa Anonima Luigi Pomini Castellanza, Italy, known as "Superpotente," and intended to transmit 3000 hp. at 330 r.p.m. It is suitable for coupling Diesel engines to propeller shafts in submersible boats. Several were delivered to Italian Navy for war service.

COAL

Dry Concentration. Dry Concentration of Coal, Ray W. Arms. Coal Industry, vol. 5, no. 1, Jan. 1922, pp. 29-32, 3 figs. Discusses principles tried in dry concentration, such as dry panning, dry blanket, friction, shape, friability, etc.

Flotation. Notes on Coal Flotation, P. E. Peterson. Can. Inst. Min. & Met. Bul. no. 117, Jan. 1922, 62-66, 6 figs. Results of experimental work to test suitability of flotation process for cleaning of Vancouver Island coals.

Low-Temperature Carbonization. Carbonizing Noncoking Soft Coal, Joseph D. Davis and C. E. Coleman. Gas Age-Rec., vol. 49, no. 4, Jan. 28, 1922, pp. 107-109, 1 fig. Report on research in low temperature coking of a mixture of 70 parts noncoking bituminous coal with 30 parts of petroleum made by Bur. of Mines at Pittsburgh station.

Low-Temperature Distillation. Products of Low Temperature Distillation of Coal, Walter Runge. Chem. Age (N.Y.), vol. 30, no. 1, Jan. 1922, pp. 9-10. Describes Smith process, and compares by-products of high and low temperature distillation, especially tar.

COKE OVENS

By-Product. New By-Product Coke Oven Plants, J. M. Hastings, Jr., Blast Furnace & Steel Plant, vol. 10, no. 1, Jan. 1922, pp. 12-17, 9 figs. Describes the Rosedale and Franklin plants constructed by Semet Solvay Co., for Cambria Steel Co. at Johnstown, Pa. Some difficulties which were successfully overcome.

COLLOIDS

Physics and Chemistry of. The Physics and Chemistry of Colloids and Their Bearing on Industrial Questions. Faraday Soc. Trans. vol. 16, part 3, no. 48, July 1921, pp. 1-190. General discussion held by Faraday Soc. and Phy- [illegible] entitled "A Short Survey [illegible] Svedberg. Deals with general [illegible], properties and structures [illegible] nature of [illegible] ueous colloidal systems; action of light and [illegible] of disperse systems; electrical theory of ab- [illegible] deposition of metals; internal pressure of liquids

COLUMNS

Buckling. Buckling of Elastic Structures. Am. Soc. Civ. Engrs. Proc., vol. 48, no. 1, Jan. 1922, pp. 103-110, 1 fig. Discussion by George Paaswell of paper by H. M. Westergaard published in same journal (Nov. 1921.).

COMPRESSED AIR

High-Pressure Handling. Methods of Handling Very High Pressures, P. W. Bridgman. Compressed Air Mag., vol. 27, no. 1, Jan. 1922, pp. 17-19, 5 figs. Explains methods of packing pistons and joints in order to obtain pressures up to 500,000 lb. per sq. in.

CONCRETE

Moisture Content, Effect of. A Study of the Effect of Moisture Content upon the Expansion and Contraction of Plain and Reinforced Concrete, Torata Matsumoto. University of Ill. Bul., vol. 19, no. 14, Dec. 5, 1921, 29 pp., 12 figs. Describes tests made to investigate amount of shrinkage which may be expected in a mortar or concrete, relation between change of moisture content and change of length of these materials, difference in shrinkage of plain and reinforced concrete, and internal stresses set up in latter.

Proportioning. Two Recent Methods for Proportioning Concrete, H. H. Scofield. Cement & Eng. News, vol. 34, no. 2, Feb. 1922, pp. 28-29, 9 figs. Notes on fineness modulus and surface area methods of designing concrete mixtures.

CONCRETING

Cold-Weather. Practical Side of Cold Weather Concreting. Eng. & Contracting, vol. 57, no. 4, Jan. 25, 1922, pp. 83-85, 3 figs. Experiences of the Turner Constr. Co., New York, in erection of concrete structures in winter months. Series of experiments made in laboratory of University of Illinois and published in Proc. Am. Concrete Inst.

CONDENSERS, STEAM

Surface. Measurement of Surface-Condenser Leakage by Electrolytic-Conductivity Method. Earl A. Keeler. Power, vol. 55, no. 4, Jan. 21, 1922, pp. 126-128, 6 figs. Discusses difficulties in applying electrical methods to measuring condenser leakage, and how some of these difficulties have been overcome. How measurements are made. Factors affecting accuracy of measurements.

CONNECTING RODS

Side Thrust to Obliquity. Side Thrust due to Obliquity of the Connecting Rod in a High Speed Reciprocating Engine, Tetsuji Sugihara. Technology Reports of Tôhoku Imperial University. vol. 2, no. 3, 1921, pp. 17-26, 7 figs. Writer seeks to obtain expression for side thrust due to obliquity of connecting rod, and expresses it graphically when these effects are taken into account.

CONVERTERS

Bessemer Side-Blown. New Side-Blown Bessemer Converter. T. Levoz. Mech. Engr., vol. 44, no. 2, Feb. 1922, p. 122, 1 fig. Historical account of development, with criticism of various types. Describes type developed by author and points out its advantages. Translated from Fonderie Moderne, no. 10, Oct. 1922, pp. 284-290, 3 figs.

CONVEYORS

Overhead System. Double-Rail Overhead Conveying System, G. L. Lacher. Iron Age, vol. 109, no. 6, Feb. 9, 1922, pp. 409-410, 5 figs. Safeguards against track-jumping. Trolleys have two, four or eight wheels, and can carry load of 3000 lb.

Steel Belt. Swedish Steel Belt Conveyors, Harry Carlson. Iron Age, vol. 109, no. 5, Feb. 2, 1922, pp. 321-323, 7 figs. Especially adapted to hot and sticky materials, which cannot be carried on rubber or fabric belts. Lower power cost.

Types. Conveying and Elevating Machinery, Gardner Mitchell. Eng. & Indus. Management, vol. 7, no. 4, Jan. 26, 1922, pp. 109-114, 6 figs. Deals with spiral or worm, screw, paddle, belt, gravity-bucket, tray, slat, push-plate or scraper, and drag-link conveyors: and chain, belt and bucket elevators. Paper read before (British) Instn. Mech. Engrs.

COPPER ALLOYS

Phosphor-Copper. Phosphor Copper. Jesse L. Jones. Metal Industry (N.Y.), vol. 20, no. 1, Jan. 1922, pp. 6-7. Discusses its increased use as a deoxidizer, and methods of obtaining best results.

CORROSION

Causes and Prevention. What It Pays to Know About Corrosion, G. A. Van Brunt. Factory, vol. 27, nos. 5 and 6, Nov. and Dec. 1921, pp. 621-623 and 763-766, 1 fig. and vol. 28, nos. 1 and 2, Jan. and Feb. 1922, pp. 49-52, 4 figs., and pp. 172-174. Nov. Causes and best methods of preventing corrosion. Dec: How coatings of various metals, variously applied, protect iron and steel. Jan: Where to use coatings of paint and japan. Feb: Oxides and phosphates: Where to use them as protective coatings.

Condenser Tubes. Results Achieved by the Corrosion Committee British Institute of Metals, Ernest E. Thum. Chem. & Met. Eng., vol. 26, no. 7, Feb., 15, 1922, pp. 301-306, 9 figs. Discusses failure of brass condenser tubes in marine service, caused by lodgment of solids which trap corrosive substances formed during process of slow general thinning.

Zinc and Tin. Corrosion Patterns on Cold-Worked Tin and Zinc, Henry S. Rawdon, Alexander I. Krynitsky and Julius F. T. Berliner. Chem. & Met. Eng., vol. 26, no. 5, Feb. 1, 1922, pp. 212-213, 3 figs. Properties of tin and zinc after deep corrosion.

COST ACCOUNTING

Chemical. Some Phases of Chemical Cost Accounting, C. B. J. Rosen. Chem. Age, N.Y., vol. 29, no. 12, Dec. 1921, pp. [illegible]. Discusses the question of process costs and their management.

Machine-Rate. Machine Rate Costing in Engineering Manufacturing Works, G. W. Beale. Jl. Indus. Administration, vol. 1, no. 8, Dec. 1921, pp. 246-253. Series of arguments leading to the conclusion that it is not commercially profitable to include machine rate costs in the regular recorded system of cost accounts of an engineering manufacturing works, but that it finds its true place in estimated costs.

COST SYSTEMS

Relation to Production. The Costing System and Its Relation to Production, G. H. Hales. Eng. & Indus. Management, vol. 17, nos. 1, 2, 3, and 4, Jan. 5, 12, 19 and 26, 1922, pp. 17-19, 31-34, 63-65, 5 figs. Jan. 5: Writer demonstrates value of coordination between costs and production department. Jan. 12: Questions relating to "productive hours" departmental expenses and establishment charges. Feb. 19: Premium bonus tickets, Jan. 26: Outlined system in practice. See also Eng. Production, vol. 4, nos. 66 and 67, Jan. 5 and 12, 1922, pp. 7-10 and 31-34, and (discussion), no. 68, Jan. 19, 1922, pp. 66-67. Paper read before Instn. Production Engrs.

CRANES

Electric Runabout. An Electric Runabout Crane. Eng. Production. vol. 4, no. 70, Feb. 2, 1922, p. 115, 1 fig. Describes trackless mobile cranes built by Ransomes, Sims & Jeffries, Ltd., Ipswich, England.

Locomotive. Increasing the Scope of Locomotive Cranes. Ry. Age, vol. 72, no. 6, Feb. 11, 1922, pp. 365-367, 4 figs. Experiences of Lehigh Valley demonstrates that a wide range of work can be handled advantageously.

CRANKCASES

Machining. Machining the Mark Crankcase, Fred H. Colvin. Am. Mach., vol. 56, no. 7, Feb. 16, 1922, pp. 256-257, 10 figs. Describes unusual milling cutter. Zylol used for detecting cracks. Methods of boring and reaming. Gages for final inspection.

CRANKSHAFTS

Forging. Radiagraph Aids in Forging Crankshafts, Fred E. Rogers. Forging & Heat Treating, vol.. 8, no. 1, Jan. 1922, pp. 26-28, 9 figs. Mechanically operated cutting torches for cutting heavy crankshafts, for preliminary cuts and cutting after cranks have been twisted through 120 deg.

Machining. A Crank Arm Turning Machine, P. M. Heldt. Automotive Industries, vol. 46, no. 2, Jan. 12, 1922, pp. 77-78, 5 figs. Describes device which simultaneously turns non-circular contours of all of the arms of an engine crankshaft.

CUTTING TOOLS

Diamond. Manufacture and Use of Diamond Cutting Tools, Ellsworth Sheldon. Am. Mach., vol. 56, nos. 4 and 6, Jan. 26 and Feb. 9, 1922, pp. 140-142, 5 figs. and 210-212, 8 figs. Jan. 26: Polishing or lapping the stone; wire-drawing dies. Feb. 9: Diamonds for drawing dies; methods of reducing diamonds to dust.

D

DIE CASTING

Methods. How Diecastings Are Produced, Herbert Chase. Autoıotive Insdutries, vol. 46, no. 1, Jan. 5, 1922, pp. 21-25, 8 figs. Describes methods followed and various types of die-casting machines employed. Characteristics of various alloys.

Pressure. Pressure Die Casting. Metal Industry (Lond.), vol. 20, no. 1, Jan. 6, 1922, pp. 1-3, 2 figs. Advantages of die casting over other forms of manufacture. Discusses half-round bearing dies.

DIESEL ENGINES

Flexibility. Diesel-Engine Flexibility, W. S. Burn. North-East Coast Instn. Engs. & Shipbuilders advance paper, no. 3228-P, for meeting Jan. 6, 1922, 40 pp. 22 figs. Investigation of flexibility of Diesel engine with view to its application to direct-driven Diesel locomotive.

Manufacture. Production of Cylinders, Pistons and Segments for Combustion Engines (Fabrication des cylindres, pistons et segments des moteurs à combustion). L'Ouvrier Moderne, vol. 4, no. 10, Jan. 1922, pp. 407-410, 2 figs. Choice and treatment of metals used in manufacture for Diesel engines.

Marine, Nobel 1600 B.H.P. Nobel-Diesel Marine Engine, George J. Steinheil. Engineer vol. 133, nos. 3448 and 3449, Jan. 27 and Feb. 3, 1922, pp. 91-93, 5 figs. partly on p. 102, and 126-128 , 6 figs. Describes latest product of Swedish Nobel-Diesel Co., Ltd., at Nynashamn. Engine is of two-cycle single-acting direct reversible crosshead marine type with 2,000 i.h.p. and giving mechanical efficiency of 80 per cent. Result of official trials.

DRAINAGE

Canadian Hydrometric Survey. Atlantic Drainage (South of St. Lawrence River), K. H. Smith. Can. Dept. of Interior, Dominion Water Power Branch, no. 29, 142 pp. 1 fig. Report of the Dominion Hydrometric Survey covering Nova Scotia, New Brunswick and Prince Edward Island, and Southwestern Quebec, for climatic years 1918-19 and 1919-20.

Canadian Hydrometric Survey. Pacific Drainage, R. G. Swan. Can. Dept. of Interior, Dominion Water Power Branch, no. 30, 281 pp., 2 figs. on supp. plates. Report of the Dominion Hydrometric Survey covering drainage in British Columbia and Yukon Territory, for climatic year 1919-20.

St. Lawrence and Southern Hudson Bay Drainage, S. S. Scovil. Can. Dept on Interior, Dominion Water Power Branch, no. 28, 1921, 85 pp., 1 fig. Report of the Dominion Hydrometric Survey covering drainage in Ontario for climatic year 1919-20.

DRILLING MACHINES

Heavy-Duty. Economy of Heavy-duty Drilling. Machinery (Lond.), vol. 19, no. 486, Jan. 19, 1922, pp. 472-477, 15 figs. Deals with the use of Colburn heavy duty drilling machine for work where heavy cuts are required.

Jigs. Dividing Drill Jigs, Hubert Bentley. Eng. & Indus. Management, vol. 7, no 1, Jan. 5, 1922, pp. 6-7, 4 figs. Engagement or disengagement of feed mechanism actuated by friction disks.

Multiple-Spindle. Some Special Machines for Intensive Production. Eng. Production, vol. 4, no. 68, Jan. 19, 1922, pp. 52-56, 7 figs. Describes different types of multiple-spindle drilling machines developed by Defiance Machine Works, Defiance, Ohio.

Radial. Recent Machine Tool Developments. Joseph Horner. Engineering, vol. 113, no. 2927, Feb. 3, 1922, pp. 126-128, 13 [illegible] figs. 8-11 6-in. radial drilling machine constructed by James, Archdale & Co., Ltd., Birmingham, England.

DRILLS

Twist, High Speed. Making the Latrobe High-Speed Twist Drill, S. Ashton Hand. Am. Mach. vol. 56, no. 7, Feb. 16, 1922, pp. 246-248, 9 figs. Steel rolled to obtain greatest density at points of wear. Flutes milled after twisting. Drills and shanks assembled by unusual methods.

DROP FORGING

Die Blocks. Die Blocks as Seen by the Drop Forge Plant, A. A. Blue. Forging & Heat Treating, vol. 8, no. 1, Jan. 1922, pp. 34-36. Qualities desired in a die block by various members of a drop-forge organization. Brief review of present practice and summary of established methods.

Die Blocks for Drop Forge Plant. Ry. Jl., vol 28, no. 2, Feb. 1922, pp. 15-16. Desirable qualities of a die block. Brief review of present practice.

Fiber Stresses in Die Blocks, Leslie Aitchison. Forging & Heat Treating, vol. 8, no. 1, Jan. 1922, pp. 36-38, 2 figs. Emphasizes the appreciation that is given in England to the direction of the grain in die block with relation to maximum work to be done by the impression. Except from address delivered before Assn. Drop Forgers & Stampers.

Stamps. Friction Lifters for Drop Stamps. W. H. Snow. Engineer, vol. 133, nos. 3446 and 3447, Jan. 13 and 20, 1922, pp. 34-36 and 60-62, 13 figs. Describes modified kick stamps, board drop stamps, and clutch-operated lifters.

Variables in. Variables in Drop Forge Practice, J. H. Nelson. Automotive Industries, vol. 46, no. 6, Feb. 9, 1922, pp. 274-276. Results of experiments in heat treatment of finished forgings; outlines five definite conclusions arrived at. Author states that there are seven possibilities of difference between drop forgings that are apparently identical.

E

EDUCATION, INDUSTRIAL

Industries and Railroads. A Review of Industrial Education and Training. Mech. Eng., vol. 44, no. 2, Feb. 1922, pp. 87-92. Education and Training in the Industries, R. L. Sackett. Education and Training on Railroads, D. C. Buell. Discussion.

ELECTRIC CONDUCTORS

Sizes for Motor Circuits. Wire Sizes for Motor Circuits, Edgar P. Slack. Power, vol. 55, no. 4, Jan. 24, 1922, pp. 129-130, 1 fig. Size of conductors for motor circuits as required by Nat. Electrical Code.

ELECTRIC DRIVE

Wire Mills. Electric Drives For Wire Mills. Blast Furnace & Steel Plant, vol. 10, no. 1, Jan. 1922, pp. 64-67, 7 figs. General description of modern electric recently installed in Alabama City works of Gulf States Steel Co.

ELECTRIC FURNACES

Counterflow-Car-Type. Counterflow Car Type Electric Furnace, Horace Drever. Forging & Heat Treating, vol. 8, no. 1, Jan. 1922, pp. 47-49, 5 figs. Describes in detail a furnace annealing gray cast iron, using the recuperative principle. Will anneal 20 tons of stock per 24-hr. day at 1450 deg. Fahr.; high thermal efficiency.

Heroult Steel. New 7-Ton Heroult Furnace. Iron Age, vol. 109, no. 5, Feb. 2, 1922, p. 325, 1 fig. Details of design capable of employing mechanical instead of hand charging.

Steel. The Present Status of Electric Furnaces in Steel Making, Harry Etchells. West of Scotland Iron & Steel Inst. Jl., vol. 29, Part 2, Nov. Session 1921-1922, pp. 2-7 and (discussion) 7-11, 1 fig. on supp. plate. Discusses various types of electric furnaces, especially the arc, and advantages of electric steel.

ELECTRIC LOCOMOTIVES

Steam vs. Railway Electrification. Steam vs. Railway Electrification, Vincent Roven. Ry. Gaz., vol. 36, no. 1, Jan. 6, 1922, pp. 11-14, 3 figs. Some advantages which may result from substitution of electric for steam locomotive operation. Describes design of various classes of electric locomotives. Abstract of papers read before North-East Coast Instn. Engrs. & Shipbuilders. See also Engineering, vol. 113, nos. 2923 and 2924, Jan. 6 and 13, 1922, pp. 25-26 and 39-43, 13 figs. partly on supp. plate and on p. 48, and Electrician, vol. 88, no. 2277, Jan. 6, 1922, pp. 10-11, 1 fig.

STORAGE-BATTERY. Accumulator Locomotives for Steel Works. Iron & Coal Trades Rev., vol. 104, no. 2811, Jan. 13, 1922, pp. 43-44, 3 figs. Describes electric apparatus built by Sanderson Bibby Co.

ELECTRIC MOTORS, A.C.

COMMUTATOR. Single and Three-Phase Alternating-Current Commutator Motors with Series and Shunt Characteristics, Stanley Parker Smith. Engineer, vol. 133, no. 3448, Jan. 27, 1922, pp. 98-100, 3 figs. (Abstract.) Paper read before Instn. Elec. Engrs.

ELECTRIC MOTORS, D.C.

SPEED REGULATION. Speed Regulation and Stability of Direct-Current Motors, Scott Hancock. Elec. Jl., vol. 19, no. 2, Feb. 1922, pp. 46-50, 7 figs. Considers armature distortion; the various effects of shifting the brushes; now to help make the speed droop; etc.

ELECTRIC RAILWAYS

INSURANCE FOR. Insurance for Electric Railways. Elec. Ry. Jl., vol. 59, no. 2, Jan. 14, 1922, pp. 73-78. Discusses types of insurance applicable to railway organizations; an efficient aid in handling labor; affords opportunity for operating economies; suggestions for executive action.

ELECTRIC TRANSMISSION LINES

CALCULATION. An Example of Transmission Line Calculations, R. D. Evan and H. K. Sels. Elec. Jl., vol. 19, no. 2, Feb. 1922, pp. 53-59, 6 figs. Discusses determination of approximate voltage and size of conductor; transmission line constants; general circuit and loss formula constants; power circle diagram constants; loss circle diagram constants; efficiency circle diagram constants; etc.

FIELD TESTS AT 280,000 VOLTS. Field Tests at 280,000 Volts on Big Creek Transmission Line, R. J. C. Wood. Elec. World, vol. 79, no. 6, Feb. 11, 1922, pp. 277-280. 10 figs. Conducted to ascertain feasibility of using existing towers and standard insulators, magnitude of corona loss and charging current, and possibilities of flashover.

PROTECTIVE RELAYS. Protective Relays Applied to Transmission Systems, H. P. Sleeper. Elec. Jl., vol. 19, no. 2, Feb. 1922, pp. 50-52, 10 figs. Discusses radial systems and loop systems.

ELECTRICAL ENGINEERING

DEVELOPMENT, 1921. Electrical Engineering in 1921. Engineer, vol. 133, nos. 3447 and 3448, Jan. 20 and 27, 1922, pp. 62-64 and 94-96. Jan. 20: Developments in power stations, turbo-generators, converters, mercury-vapor rectifiers, transformers, electric motors and electric vehicles. Jan. 27: Railway electrification; water power; electrical instruments; switchgear; cables and transmission lines; electrically driven rolling mills; electric ships; electric welding; radiotelegraphy and radiotelephony.

ELECTRIC WELDING, ARC

CAR-WHEEL FLANGES. Three Years Experience in Welding Worn Foanges, E. B. Gunn. Elec. Ry. Jl., vol. 59, no. 5, Feb. 4, 1922, p. 196. Satisfactory results have been obtained; wheel mileage has been increased greatly at small cost and with no bad results from a safety standpoint. Paper read before Central Elec. Ry. Assn.

CAST IRON. Arc-Welding of Cast Iron, A. R. Allard. Machy. (N.Y.), vol. 28, no. 6, Feb. 1922, pp. 461-464, 6 figs. Use and application of methods for welding of cast iron by electric arc.

INCREASING WELDING SPEED. Increasing Welding Speed, H. R. Pennington. Welding Engr., vol. 7, no. 1, Jan. 1922, pp. 24-25. Speed of electric arc welding can be increased by increasing electrode diameter and coating electrodes. Paper read before Am. Welding Soc.

STEEL STRUCTURES. Electric Arc Welding in Steel Structures, James Caldwell. Engineering, vol. 113, no. 2925, Jan. 20, 1922, pp. 88-90, 4 figs. Gives examples of work done, and summary of test results to date, giving some idea of extent to which welds in steel structures can be relied upon. (Abstract.) Paper read before British Instn. Mech. Engrs.

ELECTRICAL MACHINERY

ARMATURE WINDINGS. The Design of Armature Windings for Direct-Current Dynamo-Electric Machinery, H. E. Dance. Instn. Elec. Jl., vol. 60, no. 304, Dec. 1921, pp. 51-57, 6 figs. Deals with electrical design of open circuit windings on high-voltage machines used in connection with arc lamps in series, and the brush open circuit generators; mechanical design; limiting factors in design; electrical balancing of windings; windings for special purposes; etc. (Abstract.)

ELECTRICITY

AM. RY. ENG. ASSN. COMMITTEE REPORT. Report of Committee XVIII—On Electricity. Am. Ry. Eng. Assn. Bul., vol. 23, no. 239. Sept. 1921, pp. 85-129. Electrical interference; water power; electrolysis; National Electric safety code; overhead transmission line construction; specifications for commercial sdhesive tape and for rubber insulating; tape for electrical purposes.

ELECTRODEPOSITION

BUILDING UP METAL PARTS. Building Up Worn Metal Parts by Electrodeposition, W. E. Hughes. Chem. & Met. Eng., vol. 26, no. 6, Feb. 8, 1922, pp. 267-269. Discussion of relative merits of copper, nickel and iron for building up worn bearings and other metal parts.

ELEVATORS

[illegible] Devices of the Continuous Type. Eng. World, vol. 20, no. 2, Feb. 1922, pp. 90-91, 11 figs. Described in [illegible]

POWER APPLICATION TO. Electric Power Application to Passenger and Freight Elevators, Harrison P. Reed. Am. Inst. Elec. Engrs. Jl., vol. 41, nos. 1 and 2, Jan. and Feb. 1922, pp. 57-67 and 152-164, 23 figs. Notes on history and service requirements; types of elevator machines and limitation of each; characteristics and limitations of d.c. and a.c. motors; elevator controllers; brakes and other safety accessories; power consumption. Paper prepared under auspices of Subcommittee on Elevators of Indus. & Domestic Power Committee.

EMPLOYEES' REPRESENTATION

SHOP COMMITTEES. How Shop Committee Function Under Depression, Lionel D. Edie. Indus. Management, vol. 63, no. 2, Feb. 1922, pp. 92-95. Account of what happened to shop committee of Int. Harvester Co., and how these committees have handled lay-offs and wage reductions. Record includes wage cut and 20 per cent decided entirely by shop committees.

EMPLOYEES, TRAINING OF

FOUNDRY WORKERS. Industrial Training for Foundry Workers, Thos. Vickers. Foundry Trade Jl., vol. 25, nos. 283 and 284, Jan. 19 and 26, 1922, pp. 42-44 and 63-65, Jan. 19. Gives historical review. Discusses the Worshipful Company of Founders; improvements necessary in modern foundry conditions; effort of Cast Iron Research Assn. to modernize foundry production; etc. Jan. 26: American system and a German scheme.

EMPLOYMENT MANAGEMENT

ANALYSES OF WORKING FORCE. How to Analyse the Working Force, Eugene J. Benge. Management Eng., vol. 2, no. 2, Feb. 1922, pp. 79-84, 8 figs. Notes on securing facts to establish labor policies and proper working conditions.

EYE EXAMINATIONS. Better Work and More Work per Man Through Better Sight, E. LeRoy Ryer and Willard B. Fisher. Indus. Management, vol. 63, no. 2, Feb. 1922, pp. 111-117, 2 figs. Industrial eye examinations and their importance in management.

PRINCIPLES INVOLVED. Increasing Man Power Through Management. L. W. Olson. Indus. Management, vol. 63, no. 2, Feb. 1922, pp. 88-91. Writer discusses cardinal principles involved in management of men.

TESTING MOTORMEN. Psychological Tests for Motormen, Alfred Gradenwitz. Elec. Ry. Jl., vol. 59, no. 4, Jan. 28, 1922, pp. 143-146, 13 figs. Discusses physical and psychological tests which must be passed by candidates for position of motormen in Berlin.

ENGINEERING SCHOOLS

NEWARK TECHNICAL SCHOOL. College of Engineering of the Newark Technical School. Chem. Age. (N.Y.), vol. 30, no. 1, Jan. 1922, pp. 11-14, 3 figs. Discusses origin and administration of college, co-operation with industry, chemical engineering instruction, etc.

ENGINEERS

CO-OPERATION OF CHEMISTS AND. The Co-operation of the Engineer and Chemist in the Control of Plants and Processes, G. M. Gill. Gas Jl., vol. 157, no. 3061, Jan. 11, 1922, pp. 82-86 and (discussion) 86-89, 8 figs. Deals with coal and refractory materials and outlines system which has been applied with object of standardizing quality of gas. Paper read at joint meeting of (British) Instn. Mech. Engrs. and Soc. Chem. Industry. See also Engineering, vol. 113, no. 2924, Jan. 13, 1922, pp. 57-59, 8 figs.

LICENSING. Licensing and Engineering Ethics, C. E. Waddell. Professional Engr., vol. 7, no. 1, Jan. 1922, pp. 8-9. Status of the expert witness contractor, manufacturer, salesman, college graduate and practising engineer.

EVAPORATORS

LIQUOR CONCENTRATION. The Concentration of Liquors by Evaporation, James Holmes. Chem. Trade Jl. & Chem. Engr., vol. 70, no 1807, Jan. 6, 1922, pp. 1-3. Notes on heat losses in evaporation; typical quadruple-effect performances; improvements in design of evaporators.

EXCAVATION, EARTH

AMERICAN METHODS. American Methods of Excavation, Albert Lakeman. Concrete & Constructional Eng., vol. 17, no. 1, Jan. 1922, pp. 13-23, 13 figs. Gives typical examples taken from schemes actually exucuted. dealing with following methods: Plough and scraper, derrick and skip, derrick and grab, trench digger, and steam shovel.

DRAGLINES, ELECTRIC VS. STEAM. Comparison of Electric and Steam Draglines at Miami, G. L. Teeple. Eng. News-Rec., vol. 88, no. 3, Jan. 19, 1922, pp. 96-99, 2 figs. Comparative Costs of operation of steam and electric draglines. Structural weaknesses determined.

EXHAUST STEAM

UTILIZATION. The Utilization of Exhaust Steam. Engineer, vol. 133, no. 3448, Jan. 27, 1922, pp. 109-110. Outline of two papers read before joint meeting of Instn. Elec. Engrs. and Instn. Heating & Ventilating Engrs., namely, Utilization of Exhaust Steam from Electric Generating Stations and Coal Economy, by Ingham-Haden; and Utilization of Waste Heat from Electric Generating Stations, by F. N. Whysall.

F

FACTORY MANAGEMENT

See Industrial Management.

FANS

MEASURING DELIVERY. Standardized Method of Measuring Fan Delivery, E. N. Fales. Am. Soc. Heat. & Vent. Engrs. Jl., vol. 28, no. 1, Jan. 1922, pp. 1-10, 7 figs. Discusses the method as applicable not only to cooling fans, but also to larger-type propeller fans where flow is not enclosed.

FLOOD [illegible]

MARSH LAND, CONSERVANCY OF. [illegible] Engineering, vol. 113, no. 2923 [illegible] Discusses protection of low-lying marsh lands [illegible] Notes on clay embankments [illegible] electric problems.

FLOW OF FLUIDS

COMMERCIAL PIPE LINES. [illegible] roughness, especially for very viscous liquids and in critical region between viscous and turbulent flow; and to determine correction factors for pressure drop around bends.

FLOW OF WATER

KUTTER'S FORMULA. Kutter's [illegible] Eng. & Contracting, vol. 57, no. 6, Feb. 8, 1922, p. 128. It is shown that apparent discrepancies introduced by use of modified form of formula for solution of problems ordinarily met are less than discrepancies introduced by difference of .001 in determinationof value of n.

PIPES. Flow of Water through Spiral Riveted Steel Pipe, F. W. Greve and R. R. Martin. Purdue University Publications of Eng. Depts., vol. 5, no. 2, July 1921, 32 pp. 11 figs. Data and results of investigation upon flow of water through 4, 6, 8 and 10-in. [illegible] made to determine (1) variation of friction loss with velocity, for flow both with and against laps: (2) variation in accuracy of four types of piezometer rings; (3) comparison of friction loss with that in cast iron pipes for like conditions of diameter and velocity.

FORGE PLANTS

STEAM AND BOARD HAMMERS. Comparison of Steam and Board Hammers, R. C. Jennings. Forging & Heat Treating, vol. 8, no. 1, Jan. 1922, pp. 28-29. Advocates board hammer for forging of light and medium heavy parts and steam hammer where considerable drawing or heavy forging is to be done.

FORGES

GAS FORGES. Use of Gas Forges in Repair Shops, J. L. Springer. Gas Age-Rec., vol. 49, no. 5, Feb. 4, 1922, pp. 133-134. Deals with temperature regulation, combustion gases, sulphur in burning gases, and bench forges.

FOUNDRIES

GRAY-IRON. Complete Huge Wisconsin Foundry. Foundry, vol. 50, no. 3, Feb. 1, 1922, pp. 89-98, 15 figs. Describes new plant of Fairbanks, Morse & Co., with capacity of 500 tons per day of gray-iron castings varying in weight from 1 lb. to 15 tons.

FREIGHT HANDLING

ERIE RAILROAD. Erie Adopts Direct Freight Delivery at New York. Ry. Age, vol. 72, no. 3, Jan. 21, 1922, pp. 233-234, 1 fig. Plan involves breaking bulk at Jersey City, N. J., and use of auto tracks, tractors and trailers and ferries.

FUELS

BAGASSE, CALORIFIC VALUE OF. The Calorific Value of Bagasse, P. H. Parr. Int. Sugar Jl., vol. 24, no. 277, Jan. 1922, pp. 13-18. Determines heating value for bagasse, its composition, etc. Gives some comparative figures for wood.

ECONOMY. A Session on Fuel Economy. Mech. Eng., vol. 44, no. 2, Feb. 1922, pp 112-113 and 118. Discussion of four papers at A.S.M.E., meeting, namely, Boiler Plant Efficiency, by Victor J. Azbe; Boiler and Furnace Economy, D. S. Jacobus; Fuel Saving in Relation to Capital Necessary, Joseph Harrington; and Fuel Saving in Modern Gas Producers and Industrial Furnaces, W. B. Chapman. Brings out many experiences in economic boiler and furnace operation, leading to great fuel savings.

LOW-GRADE. Recent Fuel Investigations. Power Plant Eng., vol. 26, no. 3, Feb. 1, 1922, pp. 162, 164. Experiments conducted to determine feasibility of utilizing lower-grade fuels for steaming purposes.

See also Oil Fuel; Pulverized Coal.

FURNACES

COMBINATION WELDING AND PREHEATING. Combination Welding—Preheating Furnace, F. M. Gloyd. Forging & Heat Treating, vol. 8, no. 1, Jan. 1922, pp. 84-85 and 89, 7 figs. Methods at plant of A. A. Simonds & Sons Co., Dayton. Ohio, using stoker-fired furnace for preheating and welding. Special tongs and metric clock increase production materially.

FURNACES, HEATING

FORGINGS. Heating Furnaces For Forgings, C. Fischer. Blast Furnace & Steel Plant, vol. 10, no. 1, Jan. 1922, pp. 94-95, 3 figs. Discusses utilization of waste gases from heating furnaces, including direct preheating of steel by waste gases.

FUSION WELDING

CASTINGS. Utilizing Fusion Welding on Castings, H. S. Rawdon. Iron Trade Rev. vol. 70, no. 4, Jan. 26, 1922, pp. 274-276. Includes table summarizing mechanical properties of low-carbon cast steel prepared by thermit process, and by arc-fusion. Discussion of paper entitled Fusion Welding, by S. W. Miller, presented at Am. Iron & Steel Inst.

G

GAGES

ADJUSTABLE LIMIT. The Wickman Adjustable Limit Gauge for Taps. Engineering, vol. 113, no. 2926, Jan. 27, 1922, pp. 100-102, 13 figs. Describes adjustable thread caliper gage which enables screws and externally threaded part to be controlled within any desired limits of accuracy in pitch, effective diameter, etc. Its use for tap inspection.

MULTIPLE-SPLINE, GRINDING. Grinding Multiple Spline Gauges. Machinery (Lond.) vol. 19, no. 485, Jan. 12, 1922, pp. 449-450, 3 figs. Describes method of grinding multiple-spline gages having six or more splines, which has proved successful in practice.

SNAP, SETTING MACHINE FOR. Snap Gauge Setting Machine. Machinery (Lond.), vol. 19, no. 485, Jan. 12, 1922, pp. 439-440, 3 figs. Range of machine covers settings from ½ up to 10 in., and the sensitiveness is to 0.0001-in.

GAS ANALYSIS

STACK AND FUEL. Graphical Treatment of Stack Gas Analysis and Fuel Gas Analysis, W. Trinks. Blast Furnace & Steel Plant, vol. 10, no. 1, Jan. 1922, pp. 50-58, 5 figs. Gives most important phases of work regarding charts introduced by Wa. Ostwald and laid out in book called "Beiträge zur graphischen Feurungstechnik," on calculation for stack has analysis for producer gas, natural gas, by-product tar, coke-oven gas, and for coal.

GAS PRODUCERS

HOT-BLAST APPLICATION. Using Hot Air in Gas Producers for Fusing Ash (L'Emploi du vent chaud dans les gazogènes à fusion des cendres), A. Dessemond. Le Génie Civil, vol. 79, no. 26. Dec. 24 1921, pp. 561-564, 1 fig. Describes installation of Société des Houillères de St. Etienne, showing success of system with fuel containing up to 60 per cent ash, as well as with heterogeneous fuels.

GASES

CLEANING. Rotary-Type Gas Filter. Mech. Eng., vol. 44, no. 2, Feb. 1922, p. 126, 1 fig. Describes process intended to be used for removing dust, tar, oil and similar impurities from gases and vapors, developed by Freytag-Metzler and tested by E. Stach and Dr. Alexi. Translated from Zeit, des Vereines deutscher Ingenieure, vol. 65, no. 49, Dec. 3, 1921, pp. 1265-1267, 7 figs.

GEAR CUTTING

FIXING AND RELEASING OF BLANKS. Rapid Holding and Releasing of Gear Blanks, Fred Horner. Can. Machy., vol. 27, no. 5, Feb. 2, 1922, pp. 40-41 and 46, 10 figs. Holding with spring collets of external or internal type; use of draw-back rod, etc.

WORM-GEAR MACHINE. A New Worm Gear Generating Machine. Engineer, vol. 133, no. 3447, Jan. 20, 1922, pp. 78-79, 9 figs. New Machine by Smith & Coventry, Ltd., Manchester, England of tangent feed pattern, more particularly adapted to generation of single wheels or wheels in small numbers by means of less expensive fly cutter.

GEARS

AUTOMOBILE, MACHINING. Cost-Reducing Tooling Equipments, Ralph E. Flanders. Machinery (Lond.), vol. 19, no. 485, Jan. 12, 1922, pp. 441-444, 10 figs. Machines and tooling equipments used for performing turning, boring, facing, and recessing operations on automobile gears.

Tooling Equipment for Automobile Gears and Ball Races, Ralph E. Flanders. Machy. (N.Y.), vol. 28, no. 6, Feb. 1922, pp. 447-451, 14 figs. Describes jobs performed on Fay automatic lathes and operations on double-spindle flat turret lathes and Hartness automatic lathes.

GRINDING HARDENED TEETH. Grinding Hardened Gear Teeth. Eng. Production, vol. 4, no. 67, Jan. 12, 1922, pp. 42-44, 6 figs. Describes machine for finish grinding spur gear teeth to within definite limite of accuracy, and without producing scrap.

HIGH-CARBON, RECLAIMING. Reclaiming High Carbon Gears, R. L. Dowdwll. Am. Soc. for Steel Treating Trans., vol. 2, no. 4, Jan. 1922, pp. 320-322, 8 figs. Describes method by which these gears could be reclaimed by heat treatment which would give them a tough core with a hard case by varying the internal structures without altering carbon content.

HOT-ROLLING. Forming Gears by Hot Rolling, Reginald Trautschold. Iron Trade Rev., vol. 70, no. 6, Feb. 9, 1922, pp. 396-399, 6 figs. Independent application of power to die roll and gear blank and synchronization of their rotation are said to be factors contributing to success of gear-rolling processes.

INVOLUTE. Gear Tooth Shapes, E. W. Miller. Am. Mach., vol. 56, nos. 4 and 5, Jan. 26 and Feb. 2, 1922, pp. 129-132 and 168-172, 26 figs. Study of fundamentals in principles of involute gearing in endeavor to find a suitable standard form and pressure angle.

The Evolution of the Involute Gear Tooth—XI, A. Fisher. Machy. (Lond.), vol. 19, no. 487, Jan. 26, 1922, pp. 513-517, 6 figs. Involute pitch and pressure-angle permutability.

SPUR, INSPECTION OF. Inspection of Spur Gears, D. Vaughn Waters. Machy. (N.Y.), vol. 28, no. 6, Feb. 1922, pp. 465-466, 4 figs. Describes practice of Gould & Eberhardt, Newark, N.J., in inspecting spur gears, with particular reference to uniformity of tooth spacing and concentricity of pitch circle relative to axis of gear.

TRANSMISSION. Transmission (Les Transmissions), Legrand-Ribet. L'Outillage, vol. 241, no. 1, Jan. 7, 1922, pp. 8-17, 44 figs. Discusses dimensions, speed of transmissions, bearings, brakes, pulleys, etc.

VARIABLE-SPEED. Gears and Mechanisms at Variable Speed (Les embrayages et les mécanismes en mouvement varié.), H. Meuris. Annales des Travaux Publics de Belgique, vol. 22, Dec. 1921, pp. 993-1006, 4 figs. Distinguishes between those where starting and stopping occurs rarely, and where it occurs frequently, and studies useful work and lost work mathematically.

GRAVEL

FROZEN, COLD-WATER THAWING OF. Cold-Water Thawing of Frozen Gravel, Edward E. Pearce. Min. & Sci. Press, vol. 124, no. 5, Feb. 4, 1922, pp. 154-156, 3 figs. Describes new process, showing methods employed and results obtained by it on a piece of dredging ground in Candle creek, Alaska.

GRINDING MACHINES

PRACTICE. Grinding Machines and Practice—II—VII. Mech. World, vols. 70 and 71, nos. 1812, 1816, 1819, 1821, 1824 and 1829, Sept. 23, Oct. 21, Nov. 11, 25, Dec. 16, 1921 and Jan. 20, 1922, pp. 238-239, 318-320, 378-379, 418-419, p. 478 and pp. 42-43, 32 figs. Sept. 23: Discusses grain and grade; bonds used for vitrified silicate, elastic and other wheels; and natural and artificial abrasives. Oct. 21: Selection of wheels for a given job; hardness; speeds; dressing and trueing wheels; etc. Nov. 11 and 25; Design of wheel mountings. Dec. 16; Discusses the question of protection hoods and the production of sparks. Jan. 20: Cylindrical grinding machines, and wheel-spindle mounting for plain grinding machines. (To be continued.)

WHEEL-TRUEING ATTACHMENT FOR THREAD. Wheel-Trueing Attachment for Screw-Thread Grinding. Engineering vol. 113, no. 2925, Jan.20, 1922, p. 76, 4 figs. on p. 78. Describes new attachment brought out by Precision & Thread Grinder Mfg. Co., Philadelphia, Pa., primarily intended for use with maker's multi-graduated precision thread grinder.

H

HARDNESS

TESTING. Ball Hardness Testing of Semi-Steel (L'essai de Dureté à la bille sur la Fonte aciérée), M. Portevin. Fonderie Moderne, no. 11, Nov. 1921, pp. 318-321, 2 figs. Establishes empiric, formulas and gives advantages of Brinell test.

HEAT TREATING

ELECTRIC. Economics of Electric Heat Treating, E. F. Collins. Forging & Heat Treating, vol. 8, no. 1, Jan. 1922, pp. 76-81, 5 figs. Method of electric heat transmission and delivery to charge: importance of insulation in various types of furnaces.

HEATING, ELECTRIC

RESIDENCES. Electric Heating of Residences, Edgar Allan Loew. University Wash. Eng. Experiment Station Bul., no. 15, Dec. 1921, 44 pp., 8 figs. Experiments and reports on electric house heating. Experiences with domestic heating in Tacoma, Wash., and conclusions reached. Comparison of heating electrically and by means of coal, and possibilities in use of surplus, off-peak and seasonal power.

THERMAL PROCESSES. Electric Heat for Thermal Processes, E. F. Collins. Jl. Indus. & Eng. Chem. vol. 14, no. 2, Feb. 1922, pp. 101-104, 6 figs. Discusses heat generation and heat transmission, and gives examples of the various installations applying electric heat industrially.

HEATING, FACTORY

ANALYSIS. An Analysis of Factory Heating, M. C. W. Tomlison. Factory, vol. 28, no. 2, Feb. 1922, pp. 162-164, 4 figs. Twelve ways to get more heat from less coal.

HIGHWAYS

RECENT DEVELOPMENTS. Recent Developments in the Highway Field. Eng. & Contracting, vol. 57, no. 5, Feb. 1, 1922, pp. 103-108. Abstracts of papers presented before Good Roads Congress by Am. Road Builders Assn. as follows: Highway Research, W. K. Hatt; Single Track Concrete Roads for the Average County, P. C. McArdle; Utilizing Small Stream Valleys for Traffic Routes, Jay Downer; Suggestions for Future Asphalt Specifications, Leroy M. Law: Paving Widths for Highways Serving Large Cities, William F. Cavanaugh; The use of Local Mineral Aggregate in Bituminous Macadam Roads, W. A. Welch; The Bates Experimental Road of Illinois Highway Department, Clifford Older; and Uniform Legislation as Affecting Highway Traffic and Highway Transport, P. C. Fenner.

HOISTS

ELECTRIC. Factors Affecting Installation of Electric Motors for Hoisting, Gordon Fox. Elec. World, vol. 79, no. 4, Jan. 28, 1922, pp. 171-173, 1 fig. Methods of determining size of motors required. Various types of skip hoists and their [illegible] advantages and disadvantages of a.c. and d.c. drives for skip hoists.

HYDROELECTRIC DEVELOPMENTS

ST. LAWRENCE RIVER. St. Lawrence Navigation and Power Investigation. Can. Engr., vol. 42, no. 3, Jan. 17, 1922, pp. 139-145, 1 fig. Details of double deve- [illegible] New York & Ontario Power Co. Suggestions [illegible] in vicinity of Waddington. Proposed [illegible]

HYDROELECTRIC PLANTS

BATHURST, N.B. Hydro-Electric Developments Near Bathurst, N.B., James Dick. Can. Engr., vol. 42, no. 5, Jan. 31, 1922, pp. 181-185, 10 figs. Construction details of plant at Grand Falls, Nepisiguti River. 15 mi. of standard gage [illegible] reinforced concrete. Transmis- [illegible]

DESIGN. Hydro-Electric Developments, W. M. White. Denki Gakkwai Zasshi (Jl. Inst. Elec. Engrs. Japan). No. 402, Jan. 1922 pp. 21-31, 6 figs. Deals with design of power house and dam, tunnels, canals, pipe lines, turbines, draft tubes and tail race.

QUEENSTON-CHIPPAWA. First Unit for Queenston-Chippawa Water Power Plant Opened. Eng. News-Rec., vol. 88, no. 3, Jan. 19, 1922, pp. 110-111. Includes views of completed hydroelectric development around Niagara Falls in Ontario.

SOUTH AFRICA. Description of the Hydroelectric Power Plant Installed at Howick Falls, H. W. Miller. So. African Instn. of Engrs. Jl., vol. 20, no. 4, Nov. 1921, pp. 62-71, 6 figs. Describes work connected with construction of concrete diversion weir, a pipe line of some 600 ft. in length with upper section 34 in. diameter by 200 ft. long, the power house and machinery, etc. See also So. African Eng., vol. 32, no. 12, Dec. 31, 1921, pp. 242-243.

TRASH-RACK RAKE. Mechanical Trash-Rack Rake, I. W. Jones. Power, vol. 55, no. 4, Jan. 24, 1922, pp. 131-132, 3 figs. Describes rack rake developed by author, consisting of motor-operated car mounted on wheels designed to travel on rails inlaid in rack platform. Rake is supported by light structural-steel framework and operated by four steel cables.

HYDRAULIC TURBINES

GOVERNORS. Hydraulic Turbine Governors, W. R. Kepler. Elec. Jl., vol. 19, no. 2, Feb. 1922, pp. 60-68, 12 figs. Discusses limitation of speed to suit conditions demanded by character of load. Governing element may be grouped into three sections, (1) flyballs, valve and compensating device, (2) pressure system and (3) mechanism for applying energy of pressure system to change amount of water through turbine.

I

ICE MANUFACTURE

REFRIGERATING PROCESS. Voorhees' Refrigerating Economies, Gardner T. Voorhees. Ice & Refrigeration, vol. 62, no. 1, Jan. 1922, p. 22, 2 figs. Discusses the multiple-effect receiver, multiple-effect compressor, compressed exhaust-steam process, double-freezing can ice process, and the non-cracked ice and fore-cooler process. Paper read before Nat. Assn-Practical Refrig. Engrs.

ILLUMINATION

COMMITTEE REPORTS. Illumination Items by the Lighting and Illumination Committee. Am. Inst. Elec. Engrs. Jl., vol. 41, no. 2, Feb. 1922, pp. 149-151, 4 figs. Notes on preliminary report by P. W. Cobb, on influence of illumination levels upon speed of vision; electric sign lighting; and report of Committee on Elimination of Waste in Industry of Am. Eng. Council on accidents due to eye defects.

IMPACT

BARS, DURATION OF. Duration of Impact of Bars, Erwin W. Tschudi. Physical Rev., vol. 18, no. 6, Dec. 1921, pp. 423-430, 4 figs. Experiments show that duration of impact is not a linear function of length of colliding bars, a fact directly contrary to compressional wave theory.

INDICATORS

STEAM-ENGINE. The Steam-Engine Indicator Power, vol. 55, nos. 4, 5 and 6, Jan. 24, 31 and Feb. 7, 1922, pp. 142-144, 6 figs., 182-184, 10 figs, and 224, 3 figs. Jan. 24: What a reducing rig is and how it is made. Jan. 31: Reducing rigs on modern engines, and reducing wheels and cylinder connections. Feb. 7: Checking reducing rig for errors.

INDUSTRIAL MANAGEMENT

INVENTORY METHODS. How to Cut Cost Corners Through Inventory, W. M. Romig. Indus. Management, vol. 63, no. 2, Feb. 1922, pp. 86-87, 2 figs. How well-managed inventory methods help to stabilize profits.

JOB ANALYSIS. Job Analysis as a Factor in Cost Reduction, Richard S. Uhrbrock. Indus. Management, vol. 63, no. 2, Feb. 1922, pp. 100-102. Qualifications of the analyst and method of approach.

OVERHEAD DISTRIBUTION. Lightening the Factory Burden, Clinton W. Bennett. Indus. Management vol. 63, no. 2, Feb. 1922, pp. 103-106, 5 figs. Distribution of overhead for analysis and control.

PRODUCTION CONTROL. Production Control by Graphics. Machinery (Lond.), vol. 19, no. 484, Jan. 5, 1922, pp. 405-412, 13 figs. Describes system employing graphic charts for controlling shop operations in plant making cotton looms and automatic attachments for looms.

The Measurement of Human Work, Walter N. Polakov. Management Eng., vol. 2, no. 2, Feb. 1922, pp. 91-93, 1 fig. The Gantt Graphic method of controlling production is claimed to be only one on a correct unit of measurement.

PRODUCTION PLANNING. Production Planning at the Dennison Plant. Factory, vol. 28, no. 2, Feb. 1922, pp. 159-162, 4 figs. Describes system which controls made-to-order goods almost entirely, where each order requires special attention. Its main object and accomplishment is to co-ordinate all departments to secure most satisfactory ultimate results.

SALES ORGANIZATION. Sales organization and Methods, Willard W. Freeland. Taylor Soc. Bul., vol. 6, no. 6, Dec. 1921, pp. 244-251 and (discussion) pp. 251-254. Second report of committee on sales questionnaire, purpose of which was to obtain information about form of organization of sales departments, extent to which engineering phases were recognized and scientific planning and scheduling attempted, and methods of control of important portions of work of distribution organization.

SMALL SHOP OVERHEAD. Minimum Shop Operation Without Loss, D. S. Cole. Indus. Management, vol. 63, no. 2, Feb. 1922, pp. 96-97, 1 fig. Describes how small industrial plant operated plant during period of curtailed manufacturing operations without allowing overhead or fixed expense to force losses.

See also Time Study

INDUSTRIAL ORGANIZATION

DRAFTING ROOMS. The Organization of a Jig and Tool Drawing Office, H. Varley. Eng. & Indus. Management, vol. 7, no. 2, 1922, pp. [illegible], 4 figs. Development and scope of tool office; size of tool drawing office; types of jig and tool office; relationship with productive departments; layout of office organization; and division of work.

KNITTING MILLS. The Organization of Knitting Mills, Carl M. Bigelow. Management Eng., vol. 2, no. 2, Feb. 1922, pp. 111-116, 15 figs. Standardizing work of planning department.

INJECTORS

EXHAUST STEAM, LOCOMOTIVE. An Improved Exhaust Injector for Locomotives. Ry. Engr., vol. 43, no. 504, Jan. 1922, pp. 9-10 and 12, [illegible] figs. Describes advantages of new J type injector made by Davies & Metcalfe, Romiley.

INSTRUMENTS

CONTROL. The Organization of Instrument Control in Industrial Plants, Frederick J. Schlink. Management Eng., vol. 2, no. 2, Feb. 1922, pp. 67-72, 4 figs. Deals with factors in instrument control and describes some typical installations. Qualifications and duties of inspectors. Calibration and tagging of instruments. Installation, repair and maintenance.

INSULATING MATERIALS

BREAKDOWN TESTS. Breakdown Tests on Insulating Materials, N. A. Allen. Elec. Rev. (Lond.), vol. 89, no. 2301, Dec. 30, 1921, pp. 876, 3 figs. Describes method using some form of guard ring by which more accurate results are obtained providing a fairer test of the behavior of the material under uniform electric stress.

PROPERTIES. Properties and Characteristics of Insulating Materials, R. T. Fleming. Instn. Elec. Engrs. Jl., vol. 60, no. 304, Dec. 1921, pp. 58-64, 4 figs. Deals with manufacture and properties of porcelain; mica insulation, and physical properties of mica; fibrous insulation; liquid insulation, including transformer and switch oils and varnishes. (Abstract)

VARNISH. Tests on Insulating Varnish, W. S. Flight. Elec. Rev. (Lond.), vol. 89, no. 2298, Dec. 9, 1921, pp. 771-773. Describes tests made as to drying, aging, dielectric strength, acidity, oil-resisting properties, sticking qualities, softening temperature, and thermal conductivity.

INTERNAL-COMBUSTION ENGINES

LUBRICATING OILS. Lubricating Oil, W. R. G. Atkins. Automobile Engr., vol. 11, no. 158, Dec. 1921, pp. 450-452. Factors affecting its consumption in internal-combustion engines.

RESEARCH. Recent Research Work on the Internal Combustion Engine, Harry R. Ricardo. Automotive Industries, vol. 46, no. 3, Jan. 19, 1922, pp. 126-133, 15 figs. Discusses effect of latent heat of vaporization, mean volatility, temperature, pressure, dilution, mixture strength, stratification and other factors upon combustion, and especially the detonation of various fuels. Condensed from paper read before Soc. Automotive Engrs.

See also Airplane Engines; Automobile Engines; Diesel Engines; Oil Engines; Semi-Diesel Engines.

IRON

CHARCOAL, MANUFACTURE OF. Manufacture of Charcoal Iron and Charcoal Iron Boiler Tubes, W. H. S. Bateman. Southern & Southwestern Ry. Club. vol 16, no. 6, Nov. 17, 1921, pp. 10-17 and (discussion) 17-21. Describes processes of manufacture and method of rolling skelp for tubes.

IRON ALLOYS

SILICON-IRON. Silico-Thermy and its Practical Application, C. A. Heise. Iron Age, vol. 109, no. 5, Feb. 2, 1922, pp. 337-338, 5 figs. German iron-silicon castings of "thermisilid" made by thermal reactions. Silicides which are formed. Properties of new alloy. Paper read by Richard Walter before German Met. Soc.

IRON ORE

BRIQUETTING AND SINTERING OF METAL AND. The Briquetting and Agglomeration of Fine Ores (Die Stückigmachung von Feinerzen), H. Biernbaum. Metall u. Erz. vol. 19, no. 1, Jan. 8, 1922, pp. 1-8 and (discussion), pp. 8-19, 10 figs. Discusses different briquetting processes with and without additions; and sintering and agglomerating processes, including the converter and Dwight-Lloyd processes.

MAGNETIC CONCENTRATION. Magnetic Concentration of Iron Ore, Edward W. Davis. Univ. of Minn. Bul., vol. 24, no. 23, Dec. 21, 1921, 138 pp., 73 figs. Physical structure of typical iron ores; standard ore-dressing practice; magnetic roasting and concentration; standard testing methods for magnetic ores; flow sheets for iron ore concentration.

ONTARIO, DEPOSITS IN. Mattagami Iron Ore Deposits. Iron & Steel of Can., vol. 4, no. 12, Jan. 1922, pp. 10-11. Describes siderite deposits situated at Grand Rapids on Mattagami river in Ontario, and gives some analysis of samples.

SMELTING TITANIFEROUS. The Smelting of Titaniferous Iron Ores, W. M. Goodwin. Roy. Canadian Inst. Trans., vol. 13, no. 30, Sept. 1921, pp. 35-49, 2 figs. Reviews literature on the subject and discusses tests made at laboratory of Queens University to find a method of smelting suited to titaneferous iron ores.

IRON, PIG

PIG-BREAKING MACHINE. A New Pig-Breaking Machine. Foundry Trade Jl., vol. 24, no. 280, Dec. 29, 1921, p. 519, 2 figs. Describes patent of E. Roper & Co., of Keighley, made either for belt or direct motor drive.

SYNTHETIC. Recarburizing Steel for Iron Foundry Use. Foundry Trade Jl., vol. 25, no. 282, Jan. 12, 1922, pp. 29-30. Describes series of trials made at Rombach, and gives analyses of cupola-melted steel scrap, billets and slags, also typical analyses of recarburized Bessemer steel and Bessemer steel recarburized with charcoal. From Stahl u. Eisen.

L

LABOR TURNOVER

ABSENTEEISM. Absenteeism: a Quantative Study, J. D. Hackett. Management Eng., vol. 2, no. 2, Feb. 1922, pp. 85-90. Factors from experience on causes, occurrence, and duration of absenteesim and condition of absentees.

LABORATORIES

ENGINEERING WORKS. An Engineering Works Laboratory. Engineering, vol. 113, no. 2924, Jan. 13, 1922, pp. 34-36, 4 figs. Describes laboratory and equipment of W. H. Allen Sons & Co., Ltd., Bedford, England, manufacturers of high-speed engines, turbines, oil engines, electrical machinery, etc.

LATHES

SCROLL-FORMING. Lathe Formers, V. Gartside. Machy. (Lond.), vol. 19, no. 487, Jan. 26, 1922, pp. 505-507, 7 figs. Discusses scroll-turning lathes.

TURRET. Turret Lathe Tooling. Machy. (Lond.), vol. 19, no. 487, Jan. 26, 1922, pp. 500-501, 4 figs. Equipment for machining differential gear housings on turret lathes.

WHEEL. A New 48-in. Wheel Lathe. Ry. Gaz., vol. 35, no. 22, Nov. 25, 1921, pp. 815-816, 2 figs. Describes a modern wheel lathe characterized by abundance of driving power, rigidlity, efficient operating facilities, and high output, made by Noble & Lund, Ltd., Felling-on-Tyne.

LEATHER INDUSTRY

RESEARCH. Research in Leather Manufacture, Arthur W. Thomas. Mech. Eng., vol. 44, no. 2, Feb. 1922, p. 116. Describes work which has been done and points out that there is a great field in tanning industry, by prosecution of scientific research, to eliminate unnecessary wastes due to lack of knowledge of reactions.

LIGHTHOUSES

AERIAL. Aerial Lighthouses. Flight, vol. 14, no. 4, Jan. 26, 1922, pp. 52-54, 3 figs. Describes the 1,000,000,000-c.p. lighthouse which is being erected at Dijon for aerial routes between Paris and Algiers, Italy and Switzerland, made by Barbier, Bernard and Turenne, of Paris.

LIGHTING

ARTIFICIAL DAYLIGHT. Recent Improvements in the Sheringham Daylight, S. H. Groom. Illuminating Engr., vol. 14, no. 9, Nov. 1921, pp. 215-218, 4 figs. Principles upon which Sheringham daylight is based and recent improvements made.

LIGHTNING ARRESTERS

DEVIATIONS FROM STANDARD PRACTICE. On Deviations from Standard Practice in Lightning Arresters, E. E. F. Creighton. Am. Inst. Elec. Engrs., Jl., vol. 41, no. 2, Feb. 1922, pp. 99-106, 1 fig. Author endeavors to answer questions of practice and criticism of arresters brought out by investigation conducted by Protective Devices Cómmittee. Discusses use of no arresters from three standpoints. Inspection and repair of aluminum arresters.

LIGNITE

NORTH DAKOTA. Lignite in the Western Part of the Fort Berthold Indian Reservation South of Missouri River, North Dakota, Clyde Max; Bauer and Frank A. Herald. U.S. Dept. of Interior, Geological Survey, Bul. 726-D, 1921, pp. 109-172, 29 figs. Describes briefly geography and general geology and discusses in detail lignite beds, physical and chemical properties. quantity available, distribution, etc.

LIME

USES. An Outline of the Uses of Lime, M. E. Holmes. Chem. & Met. Eng., vol. 26, no. 7, Feb. 15, 1922, pp. 294-300. Discusses chemical, construction and agricultural uses, and gives chart showing the many functions and uses of lime. Paper read before Am. Inst. Chem. Engrs.

LIQUIDS

EMULSIFIED, PUMPING. Pumping Liquids and Light Bodies by Emulsifying (Pompage des liquides et des corps légers par émulsion), Henry Béduwé. Revue Universelle des Mines, vol. 11, nos. 1 and 2, Oct. 1 and 15, 1921, pp. 57-64 and 155-160, 7 figs. Oct. 1: Describes application and operation of air lift pump and experiments made by Westinghouse Air Brake Co. Oct. 15: Discusses industrial applications of emulsion pump, pumping by compressed air, etc.

LOCOMOTIVE BOILERS

PULVERIZED-COAL-FIRED. Pioneer Boilers fired with Pulverized Coal, F. P. Coffin. Combustion, vol. 6, no. 2, Feb. 1922, pp. 74-77 and 95, 2 figs. Describes the Bettington boiler, designed for firing with powdered coal or coal dust; the Erie City Iron Works boiler, designed by Aero Pulverizer Co.; and the American Locomotive Works boiler. (Abstract).

TUBE FRACTURES. Notes on Fractures in Locomotive Boiler Tubes, Henry Fowler. Faraday Soc. Trans., vol. 17, part 1, no. 49, Dec. 1921, pp. 82-90, 11 figs. Results of investigation of large tubes of boiler on Midland Railway showing brittleness and fractures.

LOCOMOTIVES

ADHESION AND RACK. Adhesion and Rack Locomotive for Sumatra. S. Abt. Ry. Age, vol. 72, no. 4, Jan. 28, 1922, pp. 263-266, 7 figs. Describes 0-10-0 type superheater four-cylinder compound locomotive of Dutch State Railways; tractive effort 30,865 lb.

BRITISH TYPES, 1921. Locomotives in 1921. Engineer, vol. 133, no. 3445, Jan. 6, 1922, pp. 10-12, 17 figs. partly on supp. plates and p. 14. Data on locomotives built for different British roads.

ELECTRIC. *See Electric Locomotives.*

FREIGHT. Geared Locomotive for Freight Service. Ry. Jl., vol. 28, no. 2, Feb. 1922, p. 12, 1 fig. Particulars of 150-ton Shay geared three-truck type locomotive for freight service in mountainous regions. Tractive power, 59,740 lb. Built by Lima Locomotive Works, Inc., for Greenbriar, Cheat & Elk Railroad.

GASOLINE. A Practical and Powerful Gasoline Switch Locomotive, J. C. Josephs, Jr., Ry. Rev., vol. 70, no. 3, Jan. 21, 1922. pp. 82-84, 4 figs. Describes the Mack gasoline locomotive by which smoke and fire risks are eliminated.

REBUILT. Rebuilt Locomotives, London & South Western Railway. Ry. Gaz., vol. 36, no. 1, Jan. 6, 1922, pp. 21-23, 6 figs. By rebuilding, tractive effort is raised from 21,620 to 23,500 lb. for freight engines, and from 16,900 to 20,240 lb. for tank engines.

STOKERS. An Everyday Run With the New Hanna Type H-2 Stoker. Ry. Rev., vol. 70. no. 2, Jan. 11, 1922, pp. 51-53, 2 figs. Describes performance on Norfolk & Western mountain-type locomotive.; tractive effort, 57, 200 lb.

THREE-CYLINDER. Three-Cylinder Locomotive for Spanish Railways. Engineer, vol. 133, no. 3449, Feb. 3, 1922, pp. 134-136, 8 figs. partly on supp. plate. Describes 8-coupled locomotive of 4-8-0 type, with double bogie tender, built by Yorkshire Engine Co., Ltd., Sheffield, England. Gives characteristics of engine and tender.

TRUCK ARRANGEMENT. On the Question of Bogies (Trucks), Axles and Springs of Locomotives, M. Bochet. Int. Ry. Assn. Bul., vol. 4, no. 1, Jan. 1922, pp. 193-250, 20 figs. Report No. 2 (All countries, except those using English language, Belgium and Scandinavian countries). Best arrangement of truck, axles and springs of locomotive for high speeds, with long wheelbases, so as to facilitate running round curves and to insure proper stability of engines.

LUBRICATING OILS

TREATMENT OF DISTILLATES. The Treatment of Refined Oil Distillate, C. D. Dean. Can. Machy., vol. 27, no. 5, Feb. 2, 1922, pp. 42-44 and 46. Removing wax by cooling; treating lubricating oils; pitches and paving asphalts; distillation under pressure; storage; etc.

LUBRICATION

VISCOSITY. Lubrication and Lubricants, Leonard Archbutt. Soc. Chem. Industry Jl., vol. 40, no. 24, Dec. 31, 1921, pp. 287T-293T. Discusses theory of viscous lubrication; measurement and expression of viscosity; effect of pressure on viscosity and density; solid contact friction; oilines and its measurement; thickness of lubricating films; solid lubricants.

M

MACHINE GUNS

PATENTS FOR INVENTIONS. Ordnance and Machine Guns. Abridgments of Specifications, Period—A.D. 1909-15, class 92 (ii), 1921, 355 pp. Patents for inventions.

MACHINE SHOPS

BRITISH. Famous British Works. Eng. Production, vol. 4, nos. 67 and 69, Jan. 12 and 26, 1922, pp. 26-28, 5 figs., and 74-76, 6 figs. Jan. 12: Describes works of Fielding & Platt, Ltd., Gloucester, for manufacture of hydraulic machinery and gas and oil engines. Jan. 26: Works of Geo. Richards & Co., Ltd., near Manchester.

DEPARTMENT LAYOUT. Department Layout in the Colburn Shop, Fred H. Colvin. Am. Mach., vol. 56, No. 7, Feb. 16, 1922, pp. 259-261, 12 figs. Arrangements for machining, erecting and testing units and compete machines. Toolroom arrangement and heat-treating department. Lavatory and coatroom.

MAGNESIUM ALLOYS

ELECTRON METAL. Elektron Metal, Adolph Bregman, Metal Industry (N.Y.), vol. 20, no. 1, Jan. 1922, pp. 1-5, 9 figs. Discusses composition; physical, chemical and electrical characteristics; fabrication, working, soldering and welding; melting and casting; principal uses; advantages and disadvantages.

MAPPING

AERIAL PHOTOGRAPHY IN. Uses of Aerial Photographs in Map Making, Glenn S. [illegible], vol. 88, no. 5, Feb. 2, 1922, pp. 194-196, 2 figs. [illegible] made within past year by Topographic Branch of U.S. Geol. Survey have proved beyond doubt that this source of information will be extensively used in connection with topographic mapping of [illegible]

MARINE BOILERS

[illegible] Coal Economy at Sea by Improved Methods of Steam [illegible], vol. 26, no. 137, 1922 (New Year Number), pp. 49-54, 5 figs. Performance of stationary and marine boiler plants; coal weighing; boiler feedwater meters; saving effected by continuous [illegible]

MECHANICS

MODERN THEORIES. Modern Theories in Mechanics (Les théories modernes de la mécanique), F. Blondel. Revue de l'Industrie Minérale, no. 25, Jan. 1, 1922 pp. 1-21, 12 figs. Discusses Einstein's theory of relativity and experiments leadimg up to it.

RIGID FRAMES, CALCULATION OF. Simplified Calculation of Rigid Frames, H. Marx. Mech. Eng., vol. 44, no. 2, Feb. 1922, p. 125, 1 fig. Describes new process devised by H. Bronneck for calculating most complicated frame shapes directly and without use of tables. Translated from Dinglers Polytechnisches Jl., vol. 336, no. 21, Oct. 22, 1921, pp. 301-302, 2 figs.

METALS

CLEANING. Industrial Methods of Metal Cleaning, F. MacDonald. Forging & Heat Treating, vol. 8, no. 1, Jan. 1922, pp. 66-70, 6 figs. Cleaning material; equipment for cleaning metal parts; methods.

COLLOIDAL STATE. Colloidal State in Metals and Alloys—III and IV, Jerome Alexander. Chem. & Met. Eng., vol. 26, nos. 4 and 5, Jan. 25, and Feb. 1, 1922, pp. 170-172 and 201-207, 11 figs. Jan. 25: White metals and brass. Feb. 1: Iron and Steel. Paper read before Am. Inst. Min. & Met. Engrs.

ELECTRODEPOSITION. Electrodeposition of Metals. Faraday Soc. Trans., vol. 16, part 3, July 1921, pp. 473-513, 12 figs. Includes following papers with discussions: Electroplating for the Prevention of Corrosion, Leslie Aitchison. Some Applications of Electrodeposition in Aeronautical Engineering, W. A. Thain. Electrodeposition of Cobalt, Byron Carr. Commercial Electrolysis of zinc Sulphate Solutions, Samuel Field. Deposition of Gold-Silver Alloys, Samuel Field.

FAILURE UNDER STRESS. Chemical Influences in the Failure of Metals under Stress, Cecil H. Desch. Faraday Soc. Trans., vol. 17, part 1, no. 49, Dec. 1921, pp. 17-21. Investigation of such instances of intercrystalline rupture as may be attributed to action of chemical reagents.

The Mechanism of Failure of Metals from Internal Stress, W. H. Hatfield. Faraday Soc. Trans., vol. 17, part 1, no. 49, Dec. 1921, pp. 36-46, 7 figs. Discusses influence of cold work, and chemical and corrosive attack. Notes on relative properties of amorphous and crystalline phases of metals, dealing with physical properties (hardness, elasticity, and capacity for plastic deformation) and chemical properties.

FATIGUE FAILURE. Remarks on Fatigue Failure of Metal Parts, their Cause and Prevention, Horace C. Knerr. Forging & Heat Treating, vol. 8, no. 1, Jan. 1922, pp. 40-42, 4 figs. Factors upon which fatigue failure degends are: Number of repetitions; range of stress; presence of points at which stress may be localized. Gives example of fatigue failure.

HARDENING. The Slip Interference Theory of the Hardening of Metals, Zay Jefferies and R. S. Archer. Chem. & Met. Eng., vol. 26, no. 6, Feb. 8, 1922, pp. 249-252. General reply to questions raised by various commentators, including condition of iron and carbon in and grain size of martensite.

INTERNAL STRESSES. Internal Stresses in Relation to Microstructure, J. C. W. Humfrey. Faraday Soc. Trans. vol. 17, part 1, no. 49, Dec. 1921, pp. 47-51, 3 figs. Author offers suggestions, and draws attention to factor in strength of materials which does not appear adequately to have been studied.

POLISHING. Motion Study in Metal Polishing. Metal Industry (Lond.), vol. 20, no. 2, Jan. 13, 1922, pp. 30-33, 3 figs. Describes experiment with a wattmeter on the process of roughing.

SEASON CRACKING. The Failure of Metals under Internal and Prolonged Stress, W. Rosenhaim. Faraday Soc. Trans., vol. 17, part 1, no. 49, Dec. 1921, pp. 2-16, 2 figs. Discussion of phenomenon known a sseason cracking, and consideration of the various explanations therefor.

MINING INDUSTRY

ANALYSIS 1921. Industrial Analysis for 1921. Eng. & Min. Jl., vol. 113, no. 3, Jan. 21, 1922, pp. 81-97. Review of copper, lead, zinc, gold, silver, platinum, quicksilver, iron-ore, manganese, chromite, nickel, tungsten, molybdenum, vanadium, uranium and radium mining, petroleum outlook, fluorspar, borax, graphite, magnesite and other industries.

MOLDING MACHINES

AIR AND ELECTRIC. Develops Air and Electric Machine. Foundry, vol. 50, no. 2, Jan. 15, 1922, pp. 75-76, 1 fig. Air used for ramming sand into molds; but electricity has been adapted for rolling flask and afterwards drawing pattern.

DESIGN. The Present Status of Molding-Machine Construction (Der heutige Stand des Formmaschinenbaues,) U. Lohse. Zeit des Vereines deutscher Ingenieure vol. 66, no. 1, Jan. 7, 1922, pp. 4-7, 12 figs. Deals with power molding machines including molding press and hydraulic molding machines.

EQUIPMENT AND USE. Molding Machine Practice Is Successful, Paul R. Ramp. Iron Age, vol. 109, nos. 6 and 7, Feb. 9 and 16, 1922, pp. 397-399 and 462-464, 13 figs. Points out that even without castings recurring in large numbers, method may be made to pay. Details of equipment and its use. Marked gain in efficiency in making cylinder and piston molds.

IMPROVEMENTS. Recent Progress in Machine Molding (Neuere Fortschritte in der Maschinenformerei), U. Lohse. Giesserei-Zeitung, vol. 19, nos. 1 and 2, Jan 3 and 10, 1922, pp. 8-12 and 29-32, 9 figs. Describes new arrangements and methods which tend to increase economy of machines molding.

MOLDING METHODS

GRAY-IRON CASTINGS. Mold Intricate Gray-Iron Castings, H. E. Diller. Foundry vol. 50, no. 2, Jan. 15, 1922, pp. 45-51, 11 figs. Describes methods used for molding gas-meter castings and automobile parts, such as flywheels, transmission housings and piston rings.

MOTOR BUSES

DESIGN. Motor Bus and Its [illegible] Ry. Jl. Bus Transportation Section [illegible] Discusses design of motor buses [illegible] comfort to passengers [illegible]
Some Factors Which [illegible] W. Clark. [illegible] Ry. Jl. Bus [illegible] pp. 14-16, 4 figs. Discusses [illegible] comfort and efficiency [illegible]

DEVELOPMENT. Evolution of the Motor Vehicle for Goods and Passenger Service. Percy Frost Smith. Inst. of Transport Jl., vol. 3, no. 1, Nov. 1921, pp. 35-44 and (discussion) pp. 44-57. History of development, and discussion of four [illegible] transmission vehicles.

DOUBLE-DECK. Details of Equipment and Cost of Operation of Double Deck Buses in Chicago. Elec. Ry. Jl. (Bus Transportation Section), vol. 59, no. 2, Jan. 14, 1922, pp. 31-36, 11 figs. Describes bus of Chicago Motor Bus Co.; seating capacity, 60; inclosed upper deck.

OVERHAULING DEPOT. An Omnibus Overhauling Depot. Engineer, vol. 133, no. 3449, Feb. 3, 1922, pp. 121-124, 19 figs. partly on pp. 130 and 137. Details of large works recently erected by London Gen. Omnibus Co., Ltd., with object of concentrating work of overhauling its vast fleet of motor buses in one building. At least 15 omnibuses are pulled to pieces and re-erected daily. See also Engineering, vol. 113, no. 2927, Feb. 3, 1922, pp. 145-147, 5 figs. partly on p. 140.

MOTORSHIPS

SINGLE AND TWIN-SCREW. Comparison Between Single and Twin-Screw Motor Ships. Shipbldg. & Shipg. Rec., vol. 18, nos. 19 and 20, Nov. 10 and 17, 1921, pp. 607-609 and 639-641, 4 figs. Nov. 19: Discusses heavy and light oil fuel; reliability; ratio of cylinder diameter and stroke. Gives table of performances of a number of Diesel-engined ships. Nov. 20: Propeller efficiency; trial results; new thrust block; cargo space; etc.

PROGRESS 1921. Motor Ships in 1921. Engineer, vol. 133, no. 3445, Jan. 6, 1922, pp. 6-8, 12 figs. partly on supp. plates. Progress in construction of motorships and marine-oil engines in Great Britain, America, Scandinavia, Holland, France, Belgium, Switzerland, Italy and Germany.

MOTOR TRUCKS

BUYING PARTS. Buying Parts for a Big Fleet - How a Big Company Economizes. Commercial Vehicle, vol. 26, no. 1, Feb. 1, 1922, pp. 8-9, 3 figs. Describes organization of Consumers Co. of Chicago, which has recently aquired ecquipment of Cook County Supply Co. and its ten subsidiary organizations.

PARTS DESIGN. Features of Recent Development in Truck Parts Design, P. M. Heldt. Automotive Industries, vol. 46, no. 1, Jan. 5, 1922, pp. 12-18, 12 figs. Discusses recent developments in engine, clutch, transmission, universal joint, rear axle and wheel design.

N

NICKEL STEEL

LOW-CARBON AND CHROMIUM. Low-Carbon Nickel and Nickel-Chromium Steels. Iron & Coal Trades Rev., vol. 104, no. 2812, Jan. 20, 1922, p. 77. Summaries of paper on the constitution and properties of low-carbon nickel steels, by J. N. Greenwood, and paper on nickel-chromium steels, by J. S. Dickenson.

O

OFFICE MANAGEMENT

CUTTING CLERICAL COST. Cutting the Clerical Cost, Henry Anson Piper. Indus. Management, vol. 63, no. 2, Feb. 1922, pp. 119-124, 7 figs. Planning procedure for plant offices in large organizations.

OIL ENGINES

SOLID-INJECTION. The Solid Injection Oil Engine, C. McTaminey. Mar. Eng. of Can vol. 12, no. 1, Jan. 1922, pp. 11-14. Describes experiments made on oil tank of the Trefoil, main engines of which are of the four-stroke cross-head type.

OIL PUMPS

QUIMBY SCREW. The Quimby Screw Pump. Shipbldg. & Shipg. Rec., vol. 19, no. 3, Jan. 19, 1922, p 73. Data on this pump which has been employed in the American naval service as a high-pressure fuel-oil service pump.

OIL SHALES

DEPOSITS. Oil Shale—A. Potential World Wide Industry, Victor G. Alderson. Min. Congress Jl., vol. 7, no. 10, Oct. 1921, pp. 406-409. Review of World's deposits.

OPEN-HEARTH FURNACES

GUN-STEEL MANUFACTURE. Acid Open-hearth Process for Manufacture of Gun Steels and Fine Steels, W. P. Barba and Henry M. Howe. Am. Inst. Min. & Metallurgical Engrs. Trans., no. 1114-S. 1922, 39 pp., 8 figs., and (in abstract) Min. & Metallurgy, no. 181, Jan.1922, pp. 32-34. Report of committee appointed during war by Engineering Division of Nat. Research Council to study steel melting and ingot production for guidance of wartime manufacturers. Precautions are given for making the ingots of proper and uniform composition; of proper macro- and micro-structure; sound, that is, free from pipes, blowholes, cracks and roughness; and to prolong life of furnace.

OSCILLOSCOPE

OPERATION. The Oscilloscope Motor Transport, vol. 34, no. 883, Jan. 30, 1922, pp. 123-124, 3 figs. Describes invention by means of which it is possible to examine any fast-running machinery either as is it were running at 11100 of its actual speed, or, at will, as if it were stationary.

OXY-ACETYLENE WELDING

PIPE. Autogenous Pipe Welding, H. B. Iglehart, Power, vol. 55, no. 5, Jan. 31, 1922, pp. 173-174, 4 figs. Account of practical demonstrations of welded pip joints made under direction of writer at W. K. Mitchell Co. shops. (A tract.) Paper read before Int. Acetylene Assn.

RODS FOR. Welding Rods for Oxy-Acetylene Welding, J. R. Dawson. Iron Age, vol. 109, no. 7, Feb. 16, 1922, pp. 468-472, 17 figs. Also Welding Engr., (vol. 7, no. 1, Jan. 1922, pp. 32, 37 and 40, 17 figs.) under title: Oxy-Acetylene Welding Rods. Their selection and composition as factor in successful results on steel. Welding cast iron. Copper and brass welding. Paper before International Acetylene Assn.

P

PACKING

TRANSIT AND STORAGE. Packing and Wrapping-Up for Transit and Storage (including Baling). Abridgments of Specifications Period—A.D. 1909-15, class 94 (i), 1921, 221 pp. Patents for inventions.

PAPER MANUFACTURE

CHEMICAL HYDRATION OF PULP. Chemical Hydration of Pulp, Alfred MacKay. Paper, vol. 29, no. 16, Dec. 21, 1921, pp. 7-10. Discusses hydration of stock by chemical treatment to replace hydration by beating, and gives results of tests carried out showing advantages of chemical hydration.

PAVEMENTS, ASPHALTS

ASPHALT-CONCRETE, SPECIFICATIONS. Dense Asphalt Concrete Pavement Specifications, J. W. Howard. Mun. & County Eng., vol. 62, no. 1, Jan. 1922, pp. 19-22. Gives apecifications which writer believes to be the best requirements for materials and construction of this type.

MINERAL AGGREGATES SPECIFICATIONS. Standardized Specifications for Mineral Aggregates for Asphalt pavements, Roy M. Green. Eng. & Contracting, vol. 57, no. 5, Feb. 1, 1922, pp. 115-117. Physical properties essential to success of various aggregates in different types of construction. Paper presented before Good Roads Congress.

LAID AND WOVE MOLDS. Laid and Wove, Dard Hunter. Paper, vol. 29, no. 16, Dec. 21, 1921, pp. 12-18, 7 figs. Origin of the terms described and their early use set forth.

PAPER MILLS

CONSTRUCTION. Paper Mill Construction, H. S. Taylor. Paper, vol. 29, no. 15, Dec. 14, 1921, pp. 9-11. Discusses engineering as related to pulp and paper industry, plant development, efficiency in operations, organization, etc.

PEAT

BRIQUETTES FROM. Commercial Briquettes from Peat, Albert L. Stillman. Am. Peat Soc. Jl., vol. 15, no. 1, Jan. 1922, pp. 18-23, 1 fig. Describes universal briquetting press, designed by E. B. A. Zwoyer, consisting of a frame—a single casting comprising base and two double-walled side girders, rolls, drive and feed. Describes shape, and physical and chemical characteristics of briquets turned out by this press.

PETROLEUM

CHEMICAL PRODUCTS FROM. Some New Petroleum Products, J. H. James. Chem. & Met. Eng., vol. 26, no. 5, Feb. 1, 1922, pp. 209-212, 2 figs. Describes work done in an attempt to prepare new chemical products by starting with petroleum as the raw material. Fundamental idea of process involved is vapor-phase, low-temperature, catalytic oxidation of asphaltic hydrocarbons of petroleum. Paper read before Am. Inst. Chem. Engrs.

REFINING. General Practice Adopted in Oil Refining, C. D. Dean. Can. Machy., vol. 27, no. 4, Jan. 26, 1922, pp. 27-29. Selection of refinery site; boiler plant and pumping requirements; details of distillation processes for oils,pitches and asphalts; fire precautions.

PIPE, STEEL

CENTRIFUGALLY CAST. Steel Pipe by the Centrifugal Process, L. Cammen. Iron Age, vol. 109, no. 6, Feb. 9, 1922, pp. 405-406. Methods and cost of Cammen process for making seamless pipe at low cost. Competition with welded pipe.

PIPE, WOOD-STAVE

REDWOOD VS. FIR. Wood-Stave Water Pipe. Pub. Works, vol. 52, no. 1, Jan. 7, 1922, p. 5, Summary of results obtained by its use in U.S. Reclamation projects during past 20 years. Comparison of fir and redwood, buried and above ground.

60-IN. PIPE LINE. 60-Inch Wood Stave Pipe Line for Hydroelectric Plant, W. A. Scott. Eng. World, vol. 20, no. 2, Feb. 1922, pp. 69-70, 2 figs. New Pipe line, 912 ft. long, was built upon a regraded bed and is supported by 166 concrete cradles, each 6 in. thick above ground, with concrete bases 12 in. thick. Staves were creosoted by vacuum process.

POLES

STIFFNESS. The Stiffness of Poles for Overhead Transmission Lines, Gower B. R. [illegible] vol. 90, no. 2302, Jan. 6, 1922, pp. 9-10, 1 fig. Discusses longitudinal forces of line, including bending and torsional forces [illegible] pressure of wind, inequality of thermal expansion in adjoining spans of unequal length.

POWER FACTOR

[illegible] Saving Money by Improving the Power Factor, Elmer S. Small. Indus. Management, vol. 63, no. 2, Feb. 1922, pp. 107-110, 6 figs. Discusses features of electrical power savings that are usually understandable only by electrical engineers.

POWER PLANTS

REMODELING. Remodeled Naval Proving Grounds Power Plant, P. J. Searles. Power vol. 55, no. 4, Jan. 24, 1922, pp. 133-134, 2 figs. Describes changes that were made, and gives total cost figures for new boiler, stoker, generator, electrical and auxiliary equipment, etc. Plant was kept in operation while work of remodeling was going on. Explains how difficulty arising in supporting steam pipes was overcome.

POWER TRANSMISSION

FRICTION LOSSES. The Problem of Efficient Power Transmission, G. C. V. Hewson. Can. Machy., vol. 27, no. 3, Jan. 19, 1922, pp. 23-26, 8 figs. Friction causes largest percentage of loss; charts and tables showing different conditions.

INDUSTRIAL PLANTS. Power Transmission in Industrial Plants, Kenneth M. Raynor. Assn. Iron & Steel Elec. Engrs., vol. 4, no. 1, Jan. 1922, pp. 1-10 and (discussion) 10-21, 5 figs. Discusses construction, operation and some operating results obtained from a 6600-volt, 25-cycle, three-phase balanced-current overhead power transmission loop system operating in a modern steel-mill plant.

PRECIPITATION

COTTRELL PROCESS. Recent Progress in Electrical Precipitation, Evald Anderson. Chem. & Met. Eng., vol. 26, no. 4, Jan. 25, 1922, pp. 151-153. Describes electrical field existing in a Cottrell 'precipitator; essentials of electric precipitation; back ionization; size of electrode and rate of precipitation; etc.

PRESSES

PUNCH, GUARD FOR. Eliminating Cold Trim Press Accidents, G. A. Kuechenmeister. Forging & Heat Treating, vol. 8, no. 1, Jan. 1922, pp. 71-72, 2 figs. After experimenting with various kinds of "two-handed" mechanical tripping devices an electrical guard was installed. Production has not suffered and accidents are eliminated.

PROPELLERS, SHIP

CRITICAL SPEED OF SHAFTS. The Critical Speed of Propeller Shafts, P. E. Brunnelli. Shipbldg. & Shipg. Rec., vol. 19, no. 1, Jan. 5, 1922, pp. 17-18, 1 fig. Develops an empirical formula which within the limits of usual applications gives results very nearly concordant with those obtained by mechanical treatment.

PULVERIZED COAL

EVAPORATIVE TESTS. Pulverized Coal (Le Combustible pulvérisé), Charles Baron. Mémoires et Compte Rendu des Travaux de la Société des Ingénieurs Civils de France, vol. 74 ,nos. 7-8-9, July-Sept. 1921, pp. 403-411, 1 fig. Details of evaporation tests carried out at various plants to show efficiency of powdered coal burning.

PREPARING AND DISTRIBUTING SYSTEM. Preparing and Distributing Powdered Coal. E. C. Greisen. Iron Age, vol. 109, no. 5, Feb. 2, 1922, pp. 326-329, 8 figs. Modern seamless steel-tube plant adopts pulverized coal as fuel. Details of system in use for furnaces and boilers.

PUMPS

BOILER-FEED, GOVERNOR FOR. Thermofeed Differential Feed-Pump Governor. Power, vol. 55, no. 5, Jan. 31, 1922, pp. 184-185, 4 figs. Describes device which, when attached to steam supply of pump, will not only cause pump to stop when any predetermined pressure has been attained, but will start pump again as [illegible] predetermined drop in pressure has taken place in fuel pipe.

PUMPS, CENTRIFUGAL

[illegible] AND LOW-LIFT. The Application of High- and Low-Lift Centrifugal Pumps. Mech. World, vol. 71, nos. 1829 and 1830, Jan. 20 and 27, 1922, pp. 46-48 and 67-68, 9 figs. Jan. 20: Characteristics of a centrifugal pump; advantages of centrifugal over reciprocating type. Describes De Laval single-stage cen- [illegible] capacity of 10,000 gal. per min. against 150 ft. head Jan. 27: Discusses boiler feeding and electrically driven centrifugal boiler-feed [illegible] surface condensers barometric and jet condensers.

PYROMETERS

[illegible] of Pyrometric Systems, R. W. New- [illegible] Forging & Heat Treating, vol. 8, no. 1, Jan. [illegible] of appreciation of sensitivity of pyrometric instru- [illegible] high factor in maintenance cost; better protection [illegible] tion.

[illegible] Instruments for Industrial Measure- [illegible] 1, Jan. 1922, pp. 18-27, 9 figs. [illegible] Discusses temperature [illegible] pyrometers, recording poten- [illegible] appearing filament-type optical [illegible] meter.

Q

QUARRIES

EXPLOSIVES AND BLASTING. Explosives and Blasting, Rock Products, vol. 25, no. 2, Jan. 28, 1922, pp. 44-48. Important relation of explosives to economical operation of stone quarries. Description of high explosives and modern methods of firing. Abstract of two papers by S. R. Russell and N. S. Greensfelder read before Nat. Crushed Stone Assn.

ROCK STRUCTURES, INFLUENCE OF. The Influence of Rock Structures on Quarry Methods, Oliver Bowles Can. Min. Jl., vol. 43, no. 5, Feb. 3, 1922, pp. 63-64. Limestone and slater quarrying; importance of rock study in the economical cutting up of rocks.

R

RADIOTELEGRAPHY

TOWER ERECTION. Antenna Tower Erection For New York Radio Central, David S. Fine. Eng. News-Rec., vol. 88, no. 6, Feb. 9, 1922, pp. 230-234, 9 figs. Floating gin-pole erects body of 410-ft. tower. Method of raising pole. Cross-arms 150-ft. long weighing 16 tons hoisted in two counter-balancing sections. Upper part of tower bolted.

RAILS

BASIC BESSEMER STEEL. Basic Bessemer Steel Rails, Cecil J. Allen. Ry. Engr., vol. 43, no. 504, Jan. 1922, pp. 5-8 and 35, 2 figs. Details of modern methods employed in Europe in production of rails by basic bessemer process, including reaction in basic converter, graphic method of estimating additions, comparison of analysis and test results, reliability of basic bessemer steel.

CORRUGATION. The Corrugation of Tramway Rails. Engineer, vol. 133, no. 3447, Jan. 20, 1922, p. 66, 1 fig. Abstract of report presented to Mun. Tramways Assn. by Rail Corrugation Sub-committee appointed to investigate corrugation of tramway rails with particular reference to vibration of rails and foundations as cause thereof.

GIRDER, ROLLING. Rolling Girder Rails, R. C. Cram. Elec. Ry. Jl., vol. 59, no. 3, Jan. 21, 1922, pp. 102-106, 16 figs. Describes the various rolling-mill processes incidental to rolling girder rails; essential difference in rolling T-rails and girder rails; recent developments.

INTERNAL FRACTURE. The Presence of Internal Fractures in Steel Rails and Their Relation to the Behaviour of the Material under Services Stresses, Henry S. Rawdon. Faraday Soc. Trans., vol. 17, part 1, no. 49, Dec. 1921, pp. 110-116, 7 figs. Discusses discontinuities or internal fractures in some types of steel rails and in other wrought-steel products, evidently serving as "nucleus" or starting point from which larger defects, termed transverse fissures, grow under stress conditions to which rails are subjected in pratice.

JOINT WELDING. Reclaiming Joints in Indianapolis, T. H. David. Elec. Ry. Jl., vol. 59, no. 5, Feb. 4, 1922, pp. 199-201. Discusses experience with Lorain weld joints, arc welding on old tracks, and thermit welding. (Abstract). Paper read before Central Elec. Ry. Assn.

LOADS, ACTION OF. Action of Rolling Loads on Rails (Etude de l'action des charges roulantes sur les rails), S. Timochenko. Le Génie Civil, vol. 79, no. 26, Dec. 24, 1921, pp. 555-556. Assumes the rail as a bar of infinite length on a continuous elastic base, and develops formulas.

MANUFACTURE. Improvement in the Manufacture of Rails. Ry. & Locomotive Eng., vol. 35, no. 1, Jan. 1922, pp. 6-7. Describes tests made with Hadfield sink-head ingots rolled by Maryland Steel Co., showing that after removal of top discard of 13 per cent, the Hadfield ingot is free from piping and undue segregation.

RAILWAY ELECTRIFICATION

ST. GOTHARD RY., SWITZERLAND. The Electrification of the St. Gothard Railway. Engineer, vol. 133, no. 3447, Jan. 20, 1922, pp. 68-70, 15 figs. partly on p. 72. Details of electrical equipment of Ritom and Amsteg power stations, locomotive types, etc.

RAILWAY MOTOR CARS

NEW HAVEN BRANCH LINES. New Haven Using Motor Cars on Branch Lines. Ry. Age, vol. 72, no. 5, Feb. 4, 1922, pp. 315-317, 4 figs. Advantages of new passenger-equipment car, including flexibility and low operating cost.

RAILWAY OPERATION

AVOIDABLE WASTE. Avoidable Waste in Car and Locomotive Operation, William Elmer. Mech. Engr., vol. 44, no. 2, Feb. 1922, pp. 93-97, 2 figs. Outlines procedure for determining whether engines are properly loaded and used. Includes several appendices, one of which gives method of working out most economical tonnage for loading freight engines of any division, based on actual practicable performance in everyday operation. Discusses avoidable waste in operation of cars under three heads: (1) Their utilization in hands of agents, shippers and consignees: (2) handling and dispatchment in yards and on road; and (3) repair and inspection.

BRITISH RAILWAY SPEEDS. Tables of British Railway Speeds in 1921. Engineer, vol. 133, no. 3449, Feb. 3, 1922, pp. 120-121. Annual statistics.

TRAIN CONTROL. The Control of Trains. Ry. Gaz., vol. 36, no. 3, Jan. 20, 1922, pp. 91-92, 1 fig. Discusses the problem of deceleration and considers brake power in relation to increased weight and speed of trains, combined with reduced headway. Summary of paper read before Instn. Civil Engrs.

RAILWAY REPAIR SHOPS

Freight-Car. Community Hospitals for Disabled Foreign Freight Cars, I. J. Tatum. Ry. Rev. vol. 70, no. 3, Jan 21, 1922, pp. 73-76, 2 figs. Advocates adequate car facilities at important interchange points on co-operative basis.

RAILWAY SHOPS

Electric Drive for. Electric Drives in Railroad Shops, Bertram S. Perry. Machy. (N.Y.), vol. 28, no. 6, Feb. 1922, pp. 477-481, 10 figs. Selection and types of motors, and application on different kinds of machine tools.

RAILWAY SIGNALING

Interlocking. Interlocking Practice of the Interborough Rapid Transit Ry., W. A. Bartley. Ry. Rev., vol. 70, no. 4, Jan. 28, 1922, pp. 113-115. Describes electropneumatic power interlocking plant and their equipment; traffic density and control, etc. From paper read before N.Y. Sectional Committee.

Light. The Light Signal Committee's Report. Ry. Gaz., vol. 36, no. 3, Jan. 20, 1922, pp. 80-81. Discusses report of departmental committee to Ministry of Transport, who have been inquiring into the potentialities of light signals. Committee favors color light as against position light.

Track Circuits. Testing of D. C. Track Circuits to Insure Safety and Efficiency, F. B. Weigel. Ry. Signal Engr., vol. 15, no. 1, Jan. 1922, pp. 7-9, 2 figs. Discusses limiting resistance at battery; bonding wires; track ballast; track relay and housing. Simple tests should be made periodically. Paper read before A.R.A.

RAILWAY STATIONS

Freight. On the Question of Goods (Freight) Stations, Edilio Ehrenfreund. Int. Ry. Assn. Bul., vol. 4, no. 1, Jan. 1922, pp. 5-24, 11 figs. Report No. 2 (Italy). Organization of receiving and delivering stations, so as to accelerate their business. Arrangement of building and tracks so as to simplify shunting (switching) operations and handling. Mechanical appliances.

On the Question of Good (Freight) Stations, M. Julien and M. Moutier. Int Ry. Assn. Bul., vol. 4 no. 1, Jan. 1922, pp. 151-192, 12 figs. Report No. 1 (All countries except Italy and those using English language.) Organization of receiving and delivering stations, so as to accelerate their business. Arrangement of buildings and tracks so as to simplify shunting (switching) operations and handling, particularly as regards goods in bulk. Mechanical appliances.

RAILWAY TIES

Specifications. Procurement of Railway Ties Under Federal Control, G. C. Yeomans. Ry. Rev., vol. 70, nos. 1, and 2, Jan. 7 and 14, 1922, pp. 20-22 and 55-57. Work of the Forest Products Section. Standard tie specification most notable achievement. Describes control and distribution of all wood preservatives, together with work involved in procurement of lumber required for construction of Railroad Administration freight cars.

Treatment. Wood Preservers Discuss Economies of Ties. Ry. Age, vol. 72, no. 4, Jan. 28, 1922, pp. 269-271, 1 fig. Factors affecting cost of treated cross ties. Economics of tie renewals. Paper read before Am. Wood-Preservers' Assn.

RAILWAY TRACK

Ballast. Report of Committee II—On Ballast. Am. Ry. Eng. Assn. Bul., vol. 23, no. 239, Sept. 1921, pp. 131-158, 6 figs. Application of ballast; ballast tools; specifications for ballast shovels.

Maintenance. On the Question of the Maintenance and Supervision of the Track, Joseph Barbieri. Int. Ry. Assn. Bul., vol. 4, no. 1, Jan. 1922, pp. 139-150. Report No. 4. (All countries, except Great Britain and America). Measures to be taken to provide an economic organization for maintenance and supervision of track, taking into consideration increase of traffic and speed as well as rise in wages and in cost of materials. Use of mechanical appliances.

Relocation. Costly Railroad Re-location. Cement & Eng. News, vol. 34, no. 2, Feb. 1922, pp. 23-24, 2 figs. Shifting 15 miles of double-track railroad around Huffman dam, Miami Conservancy District, required excavating 657,000 yd., mostly rock in one cut 120 ft. deep, placing 390,000 yd. embankment. Cost more than $3,237,000.

Relocation on the South African Government Railways. Eng. News-Rec., vol. 88, no. 3, Jan. 19, 1922, pp. 116-118, 4 figs. A 70-mi. relocation in rough country, reducing curvature 50 per cent and maximum grades from 3.3 to 1.5 per cent, is being carried out on S. A. Government Railways to meet requirements of increasing traffic.

Roadbed Construction. On the question of the Construction of the Road Bed and of the Track, M. Henry and M. Chandelier. Int. Ry. Assn. Bul., vol. 4, no. 1, Jan. 1922, pp. 251-270, 11 figs. Supp. to Report No. 2 (Oct. 1920, p. 639) (All countries, except Denmark, Sweden, Norway, Great Britain and America.) Arrangements to be adopted, in view of increase in weight of locomotives and speed of trains.

RAILWAY YARDS

Terminals and. Report of Committee XIV—On Yard and Terminals. Am. Ry. Eng. Assn. Bul., vol. 23, no. 239, Sept. 1921, pp. 65-84. Warehouses in connection with L. C. L. freight houses. Classification yards, including methods of switching from classification to departure yards.

RAILWAYS

Light. Development of Light Railways in Great Britain. Eng. News-Rec., vol. 88, no. 5, Feb. 2, 1922, p. 205. Standard gage preferable; or 30-in. for isolated lines. Light rail and load; economic operation; road motors.

Net Cost of Transportation. On the Question of the Net Cost, Rates, Samuel O. Dunn. Int. Ry. Assn. Bul., vol. 4, no. 1, Jan. 1922, pp. 123-138. Report No. 3 (America). Determination of net cost of carriage (passengers and goods), taking capital charges into consideration. Its relation to rates charged.

RECLAMATION

Oregon. 8400 Acres of Overflow Land Reclaimed Near Portland, Ore., George E. Edwards. Eng. World, vol. 20, no. 2, Feb. 1922, pp. 75-76, 4 figs. Describes improvements for Drainage District no. 1, including building of dam and dikes, digging of drainage channels, and installation of pumping plant which is described in detail.

RECTIFIERS

Mercury-Arc. Power Rectifiers, J. H. Milliken. Assn. Iron & Steel Elec. Engrs., vol. 3, no. 12, Dec. 1921, pp. 523-535 and (discussion) 535-554, 4 figs. Discusses the mercury arc rectifier, its advantages and application to large power units.

REFRACTORIES

Thermal Conductivity. On the Determination of the Thermal Conductivity, Specific Heat, Density and Thermal Expansion of Different Rocks and Refractory Materials. Yoshiaki Tadokoro. Tôhoku Imperial University Sci. Reports, vol. 10, no. 5, Dec. 1921, pp. 339-410, 42 figs, partly on supp. plates. Account of investigation begun four years ago in research laboratory of Imperial Steel Works, Yawata.

REFRIGERATING MACHINES

Modern Types. The Present Status of Design of Refrigerating Machines (Der Heutige Stand des Kältemaschinenbaues), Martin Krause. Zeit. des Vereines deutscher Ingenieure, vol. 65, no. 52, Dec. 24, 1921, pp. 1349-1355, 25 figs. Notes on working process of superheated compressor in ammonia machines. Present design of compressors and condensers. Improvement of carbonic-acid machines using hot cooling water by increasing liquid pressure. Steam refrigerating machines for low brine temperatures and high refrigerating capacities.

REFRIGERATING PLANTS

Ammonia Condensers. Types and Constructions of Ammonia Condensers. Power, vol. 55, no. 6, Feb. 7, 1922, pp. 208-210, 7 figs. Discusses principles of operation of several condensers in general use.

Economy in. Refrigerating Plant Economy Standards and Records, Victor M. Azbe. Ice & Refrigeration, vol. 62, no. 1, Jan. 1922, pp. 19-21. Discusses basic requirements of an efficient plant, including, lowest possible condenser pressure and highest possible back pressure, highest possible CO_2 and lowest possible flue-gas temperature, etc. Paper read before Nat. Assn. Practical Refrig. Engrs.

REFRIGERATION

Carbonic-Dioxide Refrigerating Cycle. The Carbonic Refrigerating Cycle, H. J. Macintire. Power, vol. 55, no. 5, Jan. 31, 1922, pp. 175-177, 2 figs. Presents latest table on properties of saturated carbon dioxide, which is said to be great inprovement over previous tables, and diagram known as total-heat diagram, showing effect of condensation or liquefaction of carbon dioxide and condition of substance.

Forecooling Liquid Ammonia. Forecooling of Liquid Ammonia, H. T. Whyte. Ice & Refrigeration, vol. 62, no. 1, Jan. 1922, p. 15. Discusses different methods. Paper read before Nat. Assn. Practical Refrig. Engrs.

Wet vs. Dry Compression. Wet vs. Dry Compression, Van. R. H. Greene. Ice & Refrigeration, vol. 62, no. 1, Jan. 1922, pp. 10-11. Objection to wet compression maximum output for minimum of power; etc. Paper read before Nat. Assn. Practical Refrig. Engrs.

RESEARCH

Mechanical Engineering Advisory Committee. Mechanical Engineering Advisory Committee for Division of Engineering, Alfred D. Flinn. Mech. Eng., vol. 44, no. 2, Feb. 1922, pp. 115-116. Describes contemplated program of committee formed within organization of Am. Soc. of Mech. Engrs.

Problems. Research Problems Discussed. Mech. Eng., vol. 44, no. 2, Feb. 1922, pp. 117-118. Discussion of papers by F. A. Wardenburg and A. D. Flinn. Report of A.S.M.E., work in lubrication, by Albert Kingsbury. Progress in steam-table research described.

RETAINING WALLS

Sand Pressure. Measured Retaining-Wall Pressure From Sand and Surcharge, Jacob Feld. Eng. News-Rec., vol. 88, no. 3, Jan. 19, 1922, pp. 106-108, 1 fig. Results of experiments conducted at University of Cincinnati on effect of settling static and dynamic surcharge, show adaptability of earth-pressure test bin described in previous issue of this journal (Aug. 25, p. 314, 1921).

RIVETING

High-Speed Hammers. Cutting Costs with Rivetting Hammers, Fred R. Daniels. Machy. (N.Y.), vol 28, no. 6, Feb. 1922, pp. 474-476, 6 figs. Several examples of cold heading and rivet-setting operations performed on high-speed riveting hammers made by the High Speed Hammer Co., Inc., Rochester, N.Y., are illustrated.

ROAD CONSTRUCTION

Cost Keeping. Cost Keeping on Highway Construction, A. R. Losh. Eng. & Contracting, vol. 57, no. 5, Feb. 1, 1922, pp. 111-112. Advantages and general principles. Paper read before Good Roads Congress.

Problem. Road Builders' Problems Discussed at Convention. Eng. News-Rec., vol. 88, no. 5, Feb. 2, 1922, pp. 202-204. Abstracts of papers presented at meeting of Am. Road Builders' Assn. as follows: North Carolina's Sub-Grade Roads, Charles M. Upham; Notes on Prick Paving Practice, W. W. Horner: Bituminous Foundations for Street and Road Pavements, High W. Skidmore; Cost Keeping on Highway Construction, A. R. Losh; Problems of Highway Contracting which Affect Costs, Henry H. Wilson; Minnesota's Highway Financing, C. M. Babcock.

ROADS

IMPACT TESTS. The Effect of Impact Forces on Road Pavements, C. A Hogentoglen Automotive Industries, vol. 46, No. 6, Feb. 1922, pp. 277-280, 7 figs. Force of impact blows, as delivered by a road impact machine, can be expressed as an equivalent static road. This offers a means of comparing resistances of paved sections when subjected to impact. Explains method of determination.

ROADS, CONCRETE

DAY-LABOR CONSTRUCTION. Cost Analysis of Day Labor Construction of Wisconsin Concrete Roads, H. J. Kuehling, Concreto, vol. 20, No. 2, Feb. 1922, pp. 81-86, 2 figs. Detailed record of work in five counties, with description of methods producing each cost result.

ROCK DRILLS

DETACHABLE BIT. A Detachable Rock-Drill Bit. Min. & Sci. Press, vol. 123, no. 24, Dec. 10, 1921, p. 806. Describes device perfected by Arthur L. Hawkesworth, consisting of a special double taper by which a bit of vanadium-steel weighing only a few ounces is securely fastened to end of piece of ordinary drill-steel.

ROLLING MILLS

CROSS. Cross-Rolling Mills. Eng. Process, vol. 3, no. 1, Jan 1922, pp. 4-6, 12 figs. Discusses mode of action and field of application, and describes the Friemel cross-rolling mill.

SHEET MILLS. Sheet Mill of the Otis Steel Company. Iron Age, vol. 109, no. 4, Jan. 26, 1922, pp. 259-263, 6 figs. Features include staggered arrangement of furnaces. Powdered coal used. Plant notable for its applications of modern equipment and design.

STRIP-ROLLING CALCULATIONS. Cold Rolled Strip Steel Calculations, S. T. Hilliard. Iron Age, vol. 109, no. 4, Jan. 26, 1922, pp. 267-268. Formulas for determining pounds output and piece-work rates in manufacturing of cold-rolled strip steel.

ROOFS

KNICKERBOCKER THEATER, COLLAPSE OF. Facts of the Knickerbocker Theater Collapse. Eng. News-Rec., vol. 88, no. 6, Feb. 9, 1922, pp. 224-229, 13 figs. Results of examination of ruins of Knickerbocker Theater in Washington. No failure of roof steel preceding fall discovered. Unseating of main truss the first traceable event. Skew bearing on curved wall. Revision of steel design and field changes. Editorial comment, pp. 221-222.

S

SAND, MOULDING

ORIGIN AND USES. Moulding Sands: Their Origin and Uses, Alexander Scott. Mech. World, vol. 71, no. 1830, Jan. 27, 1922, pp. 71-72. Discusses uses of sands as abrasives for casting molds and surface linings, building purposes, an ingredient of soap, and as a filtering medium in connection with water supplies. From paper read before Stoke Assn. of Engrs.

SCALES

PRECISION TESTS. The Precision Test of Large Capacity Scales. Scale Jl., vol. 8, no. 4, Jan. 10, 1922, p. 6, 1 fig. Gives extract from Technologic Paper 199 of Bur. of Standards, which outlines procedure for accurate test.

SCIENTIFIC MANAGEMENT

See Industrial Management.

SEMI-DIESEL ENGINES

PEUGEOT. The Peugeot Semi-Diesel Engine. Motor Transport, vol. 34, no. 882, Jan. 23, 1922, pp. 99-102, 12 figs. Describes two-cylinder two-stroke motor of original design which is being put into service in Paris by General Omnibus Co.

SEMI-STEEL

ELONGATION AND COMPRESSION. Elastic Limits of Elongation and Compression of Semi-Steel (Limites élastiques à la Traction et à la Compression de la Fonte aciérée), M. Portevin, Fonderie Moderne, no. 11, Nov. 1921, pp. 321-324, 5 figs. Gives results of tests from which curves are plotted and formula developed.

SEWAGE DISPOSAL

ACTIVATED SLUDGE. A Preliminary Study of the Activated Sludge Process, John Arthur Wilson, William R. Copeland and Henry Mills Heisig. Jl. Indus. & Eng. Chem., vol. 14, no. 2, Feb. 1922, pp. 128-130, 6 figs. Difficulties in filter-pressing sewage sludge; method of defining condition of sludge; aeration versus septic action. (Abstract.)

Results of Fine Screening and Sludge Dewatering Experiments at Milwaukee. Eng. & Contracting, vol. 57, no. 6, Feb. 8, 1922, pp. 130-132. Account of experiments with activated-sludge process. (Abstract). Report [illegible] Commission of Milwaukee, Wis.

The Design of Aeration Units and Sedimentation Tanks for the Activated Sludge Sewage Disposal Plant at Milwaukee, Wisconsin, Darwin W. Townsend. Am. Soc. Civ. Engrs. Proc., vol. 48, no. 1, Jan. 1922, pp. 43-68, 6 figs. partly on supp. plates. A number of comparatively new terms in sewage-disposal literature, applicable, probably only to this particular process are explained by writer who is entrusted with development of designs for Milwaukee Sewerage [illegible]

[illegible] Maintenance of Clean Filtering Medium in Sewage Filters, Herbert D. Bell. Can. Engrs., vol. 42, no. 3, Jan. 17, 1922, [illegible] for [illegible] sewage filters. They eliminate clogging and ponding; forking not necessary.

IMHOFF TANKS. Sewage Treatment in Imhoff Tanks, Russel Riker. Pub. Works, vol. 52, nos. 3, 4, 5 and 6, Jan. 21, 28 and Feb. 4 and 11, 1922, pp. 39-42, 59-62, 89-91 and 106-107, 10 figs. Notes on separate digestion of sewage sludge in two-story or Imhoff tanks; experiences with 37 such tanks in New Jersey, and conclusions of State Department of Health as to certain advantages and disadvantages of such tanks. Instructions for operating tanks. Foaming in tanks and experiences in trying to control it; chemical analyses of sewage and sludge.

PROGRESS, 1921. Sanitary Engineering in 1921. Engineer, vol. 133, no. 3448, Jan. 27, 1922, pp. 88-90. London main drainage and sewage disposal; power from sewage gas; the Watson experiments; Sheffield experiments in sewage aeration; activated sludge process; Manchester's new outfall sewer; the Aer-sed-con process of treatment; straw filters for sewage purification; the Linden purification processes.

SEWERS

INVERTED SIPHONS FOR. Inverted Siphons for Sewers. Pub. Works, vol. 51, nos. 18 and 19, Oct. 29 and Nov. 5, 1921, pp. 340-341 and 357-358. Presents in condensed form more valuable features of report before Boston Soc. of Civ. Engrs. of committee on inverted siphons for sewers, based on answers to questionnaires.

SHAPERS

VERTICAL. Production Work on Vertical Shapers, Edward K. Hammond. Machy. (N.Y.), vol. 28, no. 6, Feb. 1922, pp. 483-485, 5 figs. Operations advantageously performed on shapers of vertical type.

SHIPS

CARGO. The Economic Proportions of Cargo Ships, H. G. Cleghorn. Shipbldg., & Shipg. Rec., vol. 19, no. 3, Jan. 19, 1922, pp. 81-85, 12 figs. Illustrates method of solving following problem: Given the deadweight, speed, and length of voyage—what is the most suitable length, breadth, and depth? Paper read before Instn. Engrs. & Shipbuilders in Scotland.

SHIPBUILDING

METHODS. Some Notes on Shipbuilding Methods, John McGovern. North-East Cost Instn. Engrs. & Shipbuilders, advance proof, no. 2188-Q, for meeting Fev. 10, 1922, 16 pp., 10 figs. General remarks on present methods; electric welding; riveting and calking by hand or machine; recent improvements in modern shipbuilding plants abroad; mass production methods; comparison of punched versus drilled holes. Modified design of straight frame model with multiple drilling—new system successfully developed by Furness Shipbuilding Co., Ltd., in preparation of hull steel material.

WORLD DEVELOPMENT. The World's Shipbuilding. Engineering, vol. 113, no. 2926, Jan. 27, 1922, pp. 114-115. Contains table showing number and tonnage of merchant vessels of 100 tons gross and upwards launched in various countries of world during years 1892-1921.

SILICA BRICK

BREAKAGE FACTOR IN MANUFACTURE. Breakage Factors in Silica Brick Manufacture, Philip H. Jung. Chem. & Met. Eng., vol. 25, no. 5, Feb. 1, 1922, pp. 214-217. Critical discussion of those factors in manufacture of silica brick which determine breakage records; properties of silica rock; grinding; effect of bats; workmanship; drying; setting in kiln; burning; methods of firing.

SOUTH WALES SILICA. The Refractory Silica Materials of South Wales, W. R. D. Jones. Colliery Guardian, vol. 123, no. 3184, Jan. 6, 1922, p. 41. Discusses importance of texture and correct grading of materials employed in silica brick manufacture; also refractoriness.

SIPHONS

INVERTED. Construction of a Concrete Inverted Siphon. Utah Soc. Engrs. Jl., vol. 7, no. 5, Oct. 1921, pp. 85-95, 8 figs. Describes 50-in., concrete pipe line at Goulam, Idaho, carrying irrigation water across valley 6600 ft. wide. Low point of pipe line is subjected to head of 101 ft. Central plant for mixing and system of trucks to handle freshly poured pipes were used.

SPRINGS

HELICAL, CALCULATION OF. Practical Helical Spring Calculation, Alex Taub. Am. Mach., vol. 56, no. 5, Feb. 2, 1922, pp. 179-183, 2 figs. Essentials of spring design. Analyzing spring troubles mathematically.

STANDARDIZATION

GERMANY. Industrial Standardization in Germany. Mech. Engr., vol. 44, no. 2, Feb. 1922, pp. 136-137. Describes program being carried out in Germany. Organization and methods or work; work in special industries; system of "preferred numbers."

IMPORTANCE. Significance of Standardization, A.A. Stevenson. Am. Mach., vol. 56, no. 4, Jan. 26, 1922, pp. 138-139. Points out need for co-operation between industry and Federal Government. Work of committees in harmonizing conflicting standards and formulating new ones. (Abstract.) Paper presented before Am. Eng. Standards Committee.

STANDARDS

GERMAN N. D. I. REPORT. Report of the German Industry Committee on Standards (Normenausschuss der Deutschen Industrie) Betrieb, vol. 4, no. 6, Dec 24, 1921, pp. 73-77, 4 figs. Proposed standards for fastening of belt pulleys on transmission shafts, and for ball hand cranks. Problems of the working committee for screws.

STEAM

Generation and Utilization. [illegible] Management in Steam Generation and Utilization. David Brownie. Eng. & [illegible] Management, vol. 7, [illegible] 117-120, [illegible] Jan. 26 and [illegible]

STEAM ENGINES

Compound Drop-Valve. Compound Drop-Valve Mill Engine. Mech. World, vol. 71, no. 1827, Jan. 6, 1922, pp. 11-12, 3 figs. Describes cross-compound jet-condensing type of engine, having cylinders 27 in. and 55 in., with a 5-ft. stroke [illegible] Hick, Hargreaves & Co., [illegible] boiler pressure, 160 lb.

Uniflow. 300-H.P. Uniflow Engine. Engineering, vol. 113, no. 2927, Feb. 3, 1922, p. 136, 7 figs. partly on p. 137. Describes engine recently constructed under John Davidson's patents by Clayton, Goodfellow and Co., Ltd., Blackburn, England. It has a single cylinder, [illegible] and operates with steam at 160 lb. per sq. in. and 150 deg. fahr. superheat.

STEAM METERS

Kent-Hodgson. The Kent-Hodgson Steam Meters, J. L. Hodgson. So. African Eng., vol. 32, no. 12, Dec. 31, 1921, pp. 243-245, 5 figs. Describes steam meter developed by the author [illegible] Used in power stations and paper mills, collieries and cement work, due works and pumping stations, on locomotives and on ship board.

STEAM POWER PLANTS

Auxiliary Drives. Driving Power-House Auxiliaries, W. H. Smith. Power, vol. 55, no. 5, Jan. 31, 1922, pp. 166-169, 3 figs. Types of auxiliary drives; Heat-balance considerations that influence selection of drives; a.c. versus d.c. motors suitable voltage for auxiliary motors; selection of motors for various drives.

STEAM TURBINES

Blade Proportioning. The Proportioning of Steam Turbine Blading, Harold Medway Martin. Engineering, vol. 113, nos. 2923, 2924, 2925, 2926 and 2927, Jan. 6, 13, 20, 27 and Feb. 3, 1922, pp. 1-3, 33-34, 66-70, 96-98 and 128-130, 14 figs. Determination of effective thermodynamic head and general dimensions of a compound turbine to operate with given indicated hydraulic efficiency; also relation between thermodynamic head and specific volume.

STEEL

Alloy. *See Alloy Steels*

Boiler-Tube. Occurrence of Oxides and Nitrides in Boiler Tube Steel, A. E. White and J. S. Vanick. Am. Soc. for Steel Treating Trans., vol. 2, no. 4, Jan. 1922, pp. 323-330, 8 figs Discusses examination of boiler tube which has been overoxidized, or allowed to absorb and retain an excess of oxygen and nitrogen.

Castings Ingots. Leaves from a Steel Melter's Note Book, Henry D. Hibbard. Iron Age, vol. 109, no. 7, Feb. 16, 1922, pp. 465-467. Experiences in casting steel ingots in cans. How cracks were prevented. Causes of hard spots in forging ingots.

Chrome. *See Chrome Steel*

Chrome-Nickel. *See Chrome-Nickel Steel*

Cracking. Intercrystalline Cracking of Mild Steel in Salt Solutions, J. A. Jones. Faraday Soc. Trans., vol. 17, part 1, no. 49, Dec. 1921, pp. 102-109, 6 figs. Describes action of various solutions in producing cracking of steel in state of stress

Failure on Hardening. The Mechanism of the Failure of Steel upon and after Hardening, G. W. Green. Faraday Soc. Trans., vol. 17, part 1, no. 49, Dec. 1921, pp. 139-145, 7 figs. Outlines causes of stressing and subsequent failure.

Fatigue Tests. Endurance of Steel Under Repeated Stresses, D. J. McAdam, Jr. Chem. & Met. Eng., vol. 25, no. 24, Dec. 14, 1921, pp. 1081-1087, 22 figs. Fatigue tests on many commercial and alloy steels develop no evidence of "endurance limit"; ultimate tensile strength closely related to endurance stress at 1000,000,000 cycles; special White-Souther machine and semi-logarithmic graphs used.

Fracture. Intercrystalline Fracture in Steel, D. Hanson. Faraday Soc. Trans., vol. 17, part 1, no. 49, Dec. 1921, pp. 91-101, 13 figs. Discusses cases of failure which occur only under certain circumstances, in material of normal quality, when time during which stress is applied is prolonged.

Internal Service Strains. Internal Service Strains in Steel, [illegible] Howard. Faraday Soc. Trans., vol. 17, part 1, no. 49, Dec. 1921, pp. 117-122. Deals particularly with original properties and characteristics of steels, and means by which these original properties are modified.

Literature, 1921. Review of Iron and Steel Literature for 1921, E. H. McClelland. Blast Furnace & Steel Plant, vol. 10, no. 1, Jan. 1922, pp. 4-8. Classified list of the more important books, serials and trade publications during year, with a few of earlier date, not previously announced. Also in Forging and Heat Treating, vol. 8, no. 1, Jan. 1922, pp. 4-8.

Nickel. *See Nickel Steel.*

Nitrogen in. The Determination of Nitrogen in Steel, Frederik Hurum and Henry Fay. Chem. & Met. Eng., vol. 25, no. 5, Feb. 1, 1922, pp. 218-222, 2 figs. Review of literature on the subject. Describes reagents and apparatus recommended for determination of nitride nitrogen.

STEEL, HEAT TREATMENT OF

Cost Analysis. Over-all Cost of Heat-Treated Parts. C. I. Ipsen. Iron Age, vol. 109, no. 7, Feb. 16, 1922, pp. 459-462, 6 figs. Electric current or fuel cost is only a portion of total cost. Percentage of rejection important. Cost of [illegible]

Effect on Properties. The Effect of Heat Treatment on the Properties of Steel, [illegible] Engr., vol. [illegible] Nov. 1, 1921, pp. 69-74 and 109-114, 2 figs. Describes the iron-iron-carbide diagram. Notes on heating and cooling curves, effect of carbon on the change points, effect of heat on grain size, hardening and tempering.

Medium-Carbon Steel. Effect of Time in Reheating Quenched Medium-carbon Steel Below the Critical Range, Carle R. Hayward, Daniel M. MacNeil and Raymond L. Presbrey. Am. Inst. Min. & Metallurgical Engrs. Trans. no. 1111-S, 1922, 5 pp., 2 figs., and (in abstract) Min. & Metallurgy, no. 181, Jan. 1922, pp. 34-35. Results of investigation show that even 5 min. heating at 300 deg. cent. lowers considerably the strength and hardness and increases ductility; there is marked increase in ductility in passing from 400-deg. to 500-deg. treatment without equivalent lowering of strength, specimens reheated to 600 deg. cent. are nearly as ductile as annealed specimens, but have an elastic limit about 60 per cent greater.

Ordnance Purposes. Heat Treatment of Steel for Ordnance Purposes, H. F. Leary. Am. Soc. for Steel Treating Trans., vol. 2, no. 4, Jan. 1922, pp. 288-295. Discusses specification requirements for gun forgings so far as heat treatment is concerned.

STEEL, HIGH-SPEED

American Manufacture. American Practice in High-Speed Steel Manufacture, A. H. d'Arcambal. Chem. & Met. Eng., vol. 25, no. 24, Dec. 14, 1921, pp. 1097-1099, 3 figs. Impressions received on trip of inspection covering several plants. Importance of pure raw materials and metallurgical control of all steps in process is emphasized.

STOKERS

Underfeed, Operation of. The Practical Operation of an Underfeed Stoker. Power, vol. 55, no. 5, Jan. 31, 1922, pp. 179-180, 3 figs. Article, based on actual experience with type AA 4 Taylor stoker, covers following subjects: Starting up; regulating draft and stoker speed; proper thickness and contour of fire; use and misuse of long stroke of lower ram; getting rid of troublesome clinkers; dumping ash; keeping lower ram from binding.

STREET RAILWAYS

Cars, One-Man. One-Man Car Operation with Double-Truck Cars, H. S. Sweet. Elec. Ry. Jl., vol. 59, no. 4, Jan. 28, 1922, pp. 156-158, 9 figs. Describes new one-man car in Utica equipped with turnstiles to admit passengers who pay as they leave. (Abstract) Paper read before N.Y. Elec. Ry. Assn.

Two New Types of Safety Cars for Chicago, Charles Gordon. Elec. Ry. Jl., vol. 59, no. 2, Jan. 14, 1922, pp. 65-71, 14 figs. Describes single-truck and double-truck one-man safety cars, both arranged for double-end operation with separate entrance and exit passageways.

STRESSES

Concentrations Due to Notches. Stress Concentrations Due to Notches and like Discontinuities, E. G. Coker and Paul Heymans. Engineering, vol. 113, no. 2923, Jan. 6, 1922, pp. 26-28, 6 figs. Brief account of experimental investigations made on discontinuities by photoelastic methods described in previous report, whereby stress distributions have been determined sufficiently completely to allow of fairly accurate value being assigned to maximum stresses experienced under given loads. (Abstract.). Report on Complex Stress Distribution, read before British Assn. at Edinburgh.

Thermal. The Thermal Stresses in Spherical Shells Concentrically Heated, Charles H. Lees. Roy. Soc. Proc., vol. 100, no. A 705, Jan. 2, 1922, pp. 379-394, 7 figs. Discusses stresses set up in materials by difference in temperature and its application to blast furnaces and others.

STRUCTURAL STEEL

Joints of Rigid Members. Tests on Joints of Rigid Members (Versuche mit Anschlüssen steifer Stabe), H. Rudeloff. Zeit. des Vereines deutscher Ingenieure, vol. 66, no. 3, Jan. 21, 1922, pp. 68-69, 1 fig. Results of tests conducted at the State Material-Testing Bureau, Berlin-Dahlem, on rigid bars of angle and channel iron. (Abstract.) Berichte des Ausschusses für Versuche im Eisenbau des deutschen Eisenbauverbandes, no. 3.

SUBSTATIONS

Automatic. Automatic Substation Practice at Concord, N.H. Elec. Ry. Jl., vol. 59, no. 5, Feb. 4, 1922, pp. 184-185, 7 figs. Local traction system, serving capital city of granite state, utilizes two installations of labor-saving type with noteworthy reduction in operating expenses at small investment cost.

T

TELEGRAPHY

Printing Systems. Printing Telegraph Systems Applied to Message Traffic Handling A. H. Reiber. Am. Inst. Elec. Engrs. Jl., vol. 41, no. 2, Feb. 1922, pp. 79-91, 26 figs. Discusses economic principles determining applicability of automatic printing telegraph to present-day communication problems, limited to those forms of light-traffic-load printing telegraph systems which have been developed particularly for linking together departments of factory, terminal points of railroad, or branches of large corporations. Detailed description of principle of operation of three such systems.

SUBMARINE-CABLE. Submarine Cable Telegraphy, J. Willard Milnor. Am. Inst. Elec. Engrs. Jl., vol. 41., no. 2, Feb. 1922, pp. 118-136, 32 figs. Describes methods of operation, and various conditions which limit operation. General method of analysis is developed, based on extension of ordinary alternating-current theory.

TELEPHONY

AUTOMATIC. The Development of Automatic Telephony. Engineering, vol. 113, no. 2925, Jan. 20, 1922, pp. 63-66, 9 figs. Brief summary of recent advances in England. Points out main advantage of automatic switching as against manual operating from standpoint of service, administration, accommodation and finance.

An investigation of the Loss Involved in Trunking From Primary Line Switches to First Selectors Via Secondary Line Switches in Strowger Automatic Exchanges, C. McHenry. Post Office Elec. Engrs.' Jl., vol. 14, Part 4, Jan. 1922 pp. 217-227, 1 fig. Discusses plunger and rotary types of line switches, methods of trunk distribution, etc.

TERMINALS, MARINE

CARGO HANDLING. Mechanical Cargo Handling, G. H. Rae. Shipbldg. & Shipg. Rec., vol. 19, no. 1, Jan. 5, 1922, pp. 13-15. Describes experimental cranes at Liverpool docks; portable power units; comparison of crane and man-handling; apparatus for handling barrels; etc. (Abstract). Paper read before Liverpool Eng. Soc.

TEXTILE MACHINERY

MANUFACTURE. Building Textile Machinery Eng. Production, vol. 4, no. 70, Feb. 2, 1922, pp. 109-114, 14 figs. Manufacturing methods and equipment of The British Northrop Loom Co., Ltd., Blackburn.

THERMIT WELDING

JOINING BARS. Joining Bars by Thermit Welding, L. I. Grinnell. Am. Mach., vol. 56, no. 4, Jan. 26, 1922, pp. 132-133, 6 figs. Long bars needed for making lead screws of rifling machines, aligning the sections; making mold and weld.

TIME STUDY

BEDAUX HUMAN POWER MEASUREMENT. The Bedaux Principle of Human Power Measurement, L. C. Morrow. Am. Mach., vol. 56, no. 7, Feb. 16, 1922, pp. 241-245, 2 figs. Describes system practised by Chas. E. Bedaux Co., Cleveland, Ohio. Application to compensation of labor. Isolation from methods, equipment and piece rates. Simplicity of records.

TRANSFORMERS

POWER. Care and Operation of Power Transformers, J. G. Corrin. Assn. Iron & Steel Elec. Engrs., vol. 4, no. 1, Jan. 1922, pp. 23-37 and (discussion) 38-47, 4 figs. Divides power transformers into three classes insofar as methods of cooling are concerned, viz., air blast, O.I.S.C., and O.I.W.C., and discusses their operation.

TEMPERATURE AND MECHANICAL STRESSES. Temperature and Mechanical Stresses in Current Transformers, J. B. Gibbs and L. Dorfmann. Elec. World, vol. 79, no. 5, Feb. 4, 1922, pp. 221-223, 7 figs. Points out that such apparatus should be carefully investigated to ascertain thermal capacity and mechanical strength if it is liable to be subjected to very heavy short-circuit currents.

WATER IN OIL, DETERMINATION OF. Determination of Water in Transformer Oil, J. E. Shrader. Elec. World, vol. 79, no. 4, Jan. 28, 1922, pp. 174-175, 3 figs New method which does not involve usual errors encountered and with which vapor pressure can be determined.

TUBES

BRASS, INTERNAL STRESSES IN. Internal Stresses in Brass Tubes, H. N. Vaudrey and W. E. Ballard. Faraday Soc. Trans., vol. 17, part 1, no. 49, Dec. 1921, pp. 52-57, 7 figs. Deals exclusively with brass tubes of circular section containing about 70 per cent of copper.

ELLIPTIC, THICKNESS OF. Thickness of Elliptic Tubes (Epaisseur d'un tube elliptique) Gay Georges and Gay Albert. Annales de l'Energie, vol. 1, no. 6, Nov.-Dec. 1921, pp. 217-219. Calculat on based on resistance of materials.

U

UNEMPLOYMENT

CAUSES AND REMEDIES. The Unemployment Problem. Nat. Indus. Conference Board, research report no. 43, Nov. 1921, 91 pp. 9 figs. Deals with extent, causes and suggested remedies for unemployment.

INSURANCE SCHEME. Unemployment Insurance With Special Reference to Individual Firms and Industries, Henry Lesser. Jl. Indus. Administration, vol. 1, no. 8, Dec. 1921, pp. 227-239. Discusses a scheme for administration of unemployment insurance in individual firms, with ultimate object of its expansion and application to each organized industry as a separate, self-supporting entity. (Abstract.) Paper read before Inst. Indus. Administration.

V

VALVES

GATE, LOSS OF HEAD IN. Experiments Show Measurements of Valve Loss Dependent on Piezometer Location, Charles I. Corp. Wis. Engr., vol. 26, no. 4, Jan. 1922, pp. 61-62, 4 figs. Describes experiments carried out to determine loss of head due to flow of water.

[illegible] Reflux Valve. Engineering, vol. 113, no. 2923, [illegible] Describes large valves constructed by Glenfield & Kennedy, Ltd., Kilmarnock, England, consisting of a cylinder which, when [illegible] the main, and, when valve is open, [illegible] as to have a large free waterway.

VENTILATION

KATATERMOMETERS. Ventilation and Human Efficiency, Leonard Hill. Mech. [illegible] 1922, p. 69. Better health due to attention to good ventilation, and increase in efficiency and output due to cooling power [illegible] electric and recording katathermometers. From paper read before Instn. Min. & Met.

VOCATIONAL TRAINING

SEASONAL INDUSTRIES. A Management Problem in Seasonal Industries, D. W. Rockey. Indus. Management, vol. 63, no. 2, Feb. 1922, pp. 77-79, 1 fig. Problem of seasonal industries is to efficiently teach large increases of working forces in minimum of time. Solution of problem is training of largest possible corps of instructors, both as to instructional methods and as to operating procedure and organization.

W

WAGES

PIECE-PRICE SYSTEMS. Should Piece-Price Systems Be Abandoned?, James H. Delaney. Factory, vol. 28, no. 2, Feb. 1922, pp. 175-176, 2 figs. Writer tells why he believes that piece-price systems should be scrapped and how scrapping will bring lower wages without cutting piece rates.

WASTE ELIMINATION

RESEARCH AND. Elimination of Waste in Industry Through Research, F. A. Wardenburg. Mech. Eng., vol. 44, no. 2, Feb. 1922, pp. 115-116. Outlines plan of a large corporation. Suggests co-operative plan. (Abstract.)

WASTE HEAT

UTILIZATION. Utilization of waste Heat. Eng. & Indus. Management, vol. 7, no. 4, Jan. 26, 1922, pp. 102-105, 2 figs. Suggests combination of heat distribution with generation of electric current as possible means of using coal to better advantage. Based on paper presented before (British) Instn. Elec. Engrs. by V. Ingham Haden.

WASTES

ENGINEERING INDUSTRIES. Waste in the Engineering Industries. Times Eng. Supp., Jan. 21, 1922, pp. 1-5. Views of representative manufacturers on accidental and deliberate waste, routine waste, waste of business, and deficient use of machinery.

WATER

REACTIONS OF CULTURE MEDIA. The Reactions of Culture Media, George C. Bunker and Henry Schuber. Am. Water Works Assn. Jl., vol. 9, no. 1, Jan. 1922, pp. 63-116, 8 figs. In writers' opinion, reactions of culture media used in water-works laboratories should be adjusted by colorimetric method of determining the H-ion concentration; and that definite H-ion concentrations should be used for reactions of nutrient agar, nutrient gelatine, sugar broths, etc. Bibliography.

WATER GAS

BLUE, PRODUCTION. Blue Water-Gas Production, J. W. Cobb and A. Parker. Gas Jl., vol. 156, no. 3056, Dec. 7, 1921, pp. 681-682. Reply to discussion on sixth report of Gas Investigation Committee of Instn. Gas. Engrs. submitted by authors on behalf of committee.

CONTINUOUS GENERATOR. Continuous Water Gas Producer, A. W. H. Griepe. Am Gas Jl., vol. 116, no. 3, Jan. 21, 1922, pp. 53-54 and 66, 1 fig. Advantages claimed for it over intermittent type of producer. Operating data.

WATER POLLUTION

GAS-PLANT WASTES AND. Effect of Gas Plant on Taste and Odor of Water. Eng & Contracting, vol. 57, no. 6, Feb. 8, 1922, pp. 132-133. Two articles reprinted from Dec. and Jan. issues of Proc. Am. Soc. Civ. Engrs.: Interference with Water Filtration Plant Operation by Wastes from By-Product Coke Ovens and Gas Works, C. A. Emerson. Jr.; and Experiences at Milwaukee, V. M. Baker

WATER SUPPLY

GREAT BRITAIN, 1921. Water Supply in 1921. Engineer, vol. 133, no. 3447 Jan. 20, 1922, pp. 64-66. Review of development in Great Britain, with note on the Littleton reservoir and other works of Metropolitan Water Board de-ironing water; Birkenhead's supply from Lake Alwen; Cardiff's new water works; Scar House hydroelectric plant; compensation water for River Don Manchester's water supply; etc.

PURIFICATION. Water Supply and Water Purification: A Symposium. Am. Soc Civ. Engrs. Proc., vol. 48, no. 1, Jan. 1922, pp. 117-124. Continued from Dec. 1921.

SCREEN FOR INTAKE WELL. Water Intake Protected Against Severe Conditions Eng. News-Rec., vol. 88, no. 6, Feb. 9, 1922, pp. 235-236, 3 figs. Describes largest traveling screen outfit in world. Pivoted crane with grab bucket remove logs and dirt from deep well.

WATERWAYS

ST LAWRENCE RIVER PROJECT. Solving the Problem of St. Lawrence Navigation Chas. P. Loveland. Can. Engr., vol. 42, no. 5, Jan. 31, 1922, pp. 189-19 Shortcomings of schemes so far proposed. Navigation value of side canals questioned. Two-stage development on international section favored.

ST. LAWRENCE. Why the Joint Commission Favors the St. Lawrence Waterway Eng. News-Rec., vol. 88, no. 5, Feb. 2, 1922, pp. 200-201. Summary of conclusions of report discusses navigation possibilities, economies and engineering features.

WELDING

LOCOMOTIVE BOILERS. Locomotive Boiler Welding. Welding Engr., vol. 7, no. Jan. 1922, pp. 26-28, 19 figs. Special committee of Master Boiler Maker Assn. reports best methods of reconditioning boilers. To be presented before Master Boiler Makers' Assn. convention.

WIRE SPECIFICATIONS. Welding Wire Specifications and Folios. Am. Welding Soc Bul. no. 1, Dec. 1921, 16 pp. Report of committee.

See also Electric Welding, Arc: Fusion Welding: Oxy-Acetylene Weld; Thermit Welding.

WELDS

TEST STANDARDS. Committee Recommends Standards for Tests of Welds. Automotive Industries, vol. 46, no. 1, Jan. 5, 1922, pp. 19-20, 6 figs. Describes the shop commercial and research standards of tests which Am. Bur. of Welding committee finds are desirable.

Standards for Testing Welds. Am. Welding Soc., Bul. no. 1, June 192 16 pp. 14 figs. Report of committee.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of engineering profession.

PHOTOSTATIC PRINTS

Photostatic copies of the articles listed in this section, or others on engineering subjects, may be obtained from the Engineering Societies Library.

Price of each print (up to 11 by 14 in. size) 25 cents, plus postage. Where possible, two pages, up to 7 by 9 in. size, will be photographed on one print. Larger magazines require a print per page. Bills will be mailed with the prints.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made, sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director
Engineering Societies Library,
29 West Thirty-ninth Street, New York, N.Y.

A

ABRASIVES

PROPERTIES AND USES. Grinding Wheels (Les Meules Artificielles), E. Assié. Arts et Métiers, vol. 74, no. 12, Sept. 1921, pp. 265-270, 7 figs. Discusses abrasives, carborundum, corundum, melting points, resistance to acid, use as refractories, etc.

ACCIDENTS

PLACING RESPONSIBILITIES. Placing Responsibility for Accidents, H. L. Keely. Management Eng., vol. 2, no. 3, Mar. 1922, pp. 149-152, 3 figs. Through classifying according to kind and cause and by estimating cost of remedies.

ACCOUNTING

PIG-IRON PRODUCTION. Accounting for Pig-Iron Production, Nathaniel B. Bergman. Jl. of Accountancy, vol. 33, no. 2, Feb. 1922, pp. 90-99. Discusses blast-furnace operations and how to deal with them in accountancy.

AERODYNAMICS

STANDARDIZATION. Standardization in Aerodynamics, W. Margoulis. Aerial Age, vol. 14, no. 26, Mar. 6, 1922, pp. 614-615. Agrees with article of same title by W. Knight, published in Aerial Age, June 20, 1921, as to standardization on basis of experiments of American, British, French and German quasi-official laboratories.

AERONAUTICS

HYDRODYNAMICS, APPLICATION OF. Applications of Modern Hydrodynamics to Aeronautics, L. Prandtl. Nat. Advisory Committee for Aeronautics, Report no. 116, 1921, 61 pp., 62 figs. Discusses the theoretical underlying principles, theory of aerofoils, and application of aerofoil theory to screw propellers.

AIR COMPRESSORS

EXPLOSIONS. Explosions in Air Compressors, A. D. Risteen. Sugar, vol. 24, no. 2, Feb. 1922, pp. 99-100. Deals with presence of lubricating oil and carbon deposits, and suggests that all accumulation of deposits be prevented. From address before Nat. Safety Council.

AIR CONDITIONING

AIR DRYING. The Volume of Air Required in Air Drying, C. T. Mitchell. Chem. & Met. Eng., vol. 25, no. 24, Dec. 14, 1921, pp. 1088-1090, 3 figs. Factors affecting atmospheric evaporation; cooling of air during evaporation, distinction between wet bulb temperature and dew point; calculation of volume of air required, etc. Charts for 100, 85, and 70 per cent ultimate humidity.

AIRCRAFT CONSTRUCTION MATERIALS

WIRE CABLE, ELASTICITY OF. A Study of the Elastic Properties of Small-Size Wire Cable, R. R. Moore. Mech. Eng., vol. 44, no. 2, Feb. 1922, pp. 105-106 and 111. Results of series of tests carried out at McCook Field, Dayton, Ohio, in which it is shown that modulus of elasticity of small-sized wire aircraft cable varies from 15,000,000 to 28,000,000, depending upon size and type of cable. It was also found that modulus of elasticity may be raised by loading cable below elastic limit and that resting the cable does not seem to have any definite effect on modulus.

AIRPLANE ENGINES

AIR-COOLED. Air-Cooled Engine Development, Charles L. Lawrence. Soc. Automotive Engrs. Jl., vol. 10, no. 2, Feb. 1922, pp. 135-141 and 144, 13 figs. Describes British experiments to improve performance of air-cooled engines for aircraft, which lead eventually to development of aluminum cylinders with steel liners and aluminum cylinder heads with steel cylinder screwed into head. Advantages of these and disadvantages of other types.

GASOLINE TESTS. Tests of Aeroplane Motor with Different Gasolines, O. J. May and Howard Cooper. Sci. Lubrication, July 1921, pp. 9-13, 4 figs. Describes tests made to show effect of using different grades of gasoline in aeronautical engine operation.

AIRPLANE PROPELLERS

THRUST AND TORQUE CHARACTERISTICS. Tests on Air Propellers in Yaw, W. F. Durand and E. P. Lesley. Nat. Advisory Committee for Aeronautics Report, no. 113, 1921, 37 pp., 26 figs. Results of tests to determine thrust (pull) and torque characteristics of air propellers in movement relative to air in a line oblique to line of shaft, and specifically when such angle of obliquity is large, as in case of helicopter flight with propeller serving for both sustentation and traction.

AIRPLANES

FLYING BOATS. *See Flying Boats.*

GLIDERS. *See Flight, Soaring.*

HELICOPTERS. *See Helicopters.*

PASSENGER. The Problem of the Passenger Aeroplane, W. D. Beatty. Aeroplane, vol. 22, no. 2, Jan. 11, 1922, pp. 27-28, 1 fig. Deals with comfort of passengers on commercial aircraft. Discusses desirable attributes not yet incorporated in modern machines; military development of airplane; beginning of commercial development; design of detail; noise; ventilation; heating; etc. Paper read before Roy. Aeronautical Soc.

AIRSHIPS

R 38 DISASTER. The Loss of the "R 38". Engineering, vol. 113, no. 2931, Mar. 3, 1922, pp. 265-266. Editorial discussion of report of Accidents Investigation Sub-Committee of Aeronautical Research Committee. Fundamental error of judgment made in design appears to have been that calculations of staff failed to take into account the aerodynamic forces to which ship would be subjected in flight, and considered only forces and moments due to distribution of weight and buoyancy, including gas pressures.

ALLOY STEELS

CHROME-MOLYBDENUM. Chrome-Molybdenum-Steel Applications From the Consumer's Viewpoint, C. N. Dawe. Forging & Heat Treating, vol. 8, no. 2, Feb. 1922, pp. 109-113. Results of physical tests, comparing medium-carbon, chrome-molybdenum, chrome-vanadium, chrome-nickel and chrome steels, expressed by means of a merit index. Paper read before Soc. Automotive Engrs.

HIGH ELASTIC LIMIT. Some Alloy Steels of High Elastic Limit, Their Heat Treatment and Microstructure, Charles M. Johnston. Am. Soc. for Steel Treating Trans., vol. 2, no. 6, Mar. 1922, pp. 500-506, 13 figs. Describes non-high-speed series which are said to be most promising by reason of tensile values given in tables, and by reason by uniform, tough and dense microstructure of heat-treated condition.

STRUCTURAL, TENSILE PROPERTIES OF. Tensile Properties of Some Structural Alloy Steels at High Temperatures, H. J. French. U. S. Bur. of Standards Technologic Papers, no. 205, Dec. 21, 1921, pp. 77-92, 8 figs. Results of determination of tensile strength, proportional limit, elongation, reduction of area, and strength at fracture throughout range 20 to 550 deg. cent. for four steels containing about 0.38 per cent carbon. Brief reference is made to type of fractures obtained in testing steels at various temperatures, and particular attention is paid to comparison of tensile properties of these alloys at 550 deg. cent.

ALLOYS

BEARING-METAL. *See Bearing Metals.*

CHROMIUM. *See Chromium Alloys.*

COPPER. *See Copper Alloys.*

AMMONIA COMPRESSORS

LOSSES IN. Analysis of Losses in Ammonia Compressors, S. F. Smith. Ice & Refrigeration, vol. 62, no. 2, Feb. 1922, pp. 154-155. Discusses losses as they occur and conditions which control same.

APPRENTICES, TRAINING OF

PLANT VS. CONTINUATION SCHOOLS. The Training of Workers in Manufacture, J. V. L. Morris. Am. Mach., vol. 56, no. 7, Feb. 16, 1922, pp. 249-251. General conditions of apprenticeship; problems arising from school; plant school vs. part-time and continuation schools.

ARCHES

REINFORCED-CONCRETE. Constructing Reinforced Concrete Arches Without Scaffolding (Procédé de construction, sans cintres, des grands arcs en béton armé), Ch. Dantin. Génie Civil, vol. 80, no. 2, Jan. 14, 1922, pp. 37-40, 16 figs. Describes the Gouyaud system, in which a metal casing is substituted for concreting.

ARMATURES

LOCATING FAULTS IN D.C. Locating Faults in Direct-Current Armatures—Short-Circuits in Parallel Windings, B. A. Briggs. Power, vol. 55, no. 8, Feb. 21, 1922, pp. 303-305, 4 figs. Methods of locating defects in windings, with a low-reading voltmeter, before machine is put into service.

AUTOMOBILE ENGINES

NEW YORK SHOW. Powerplant Trends as Seen at the Show, Herbert Chase. Automotive Industries, vol. 46, no. 2, Jan. 12, 1922, pp. 62-65, 3 figs. Discusses cooling systems, aids to starting, lubrication and piston design, valves, gearing and crankshafts, etc.

AUTOMOBILES

BRAKES. Automobile Brakes, Sydney V. James. Armour Engr., vol. 13, no. 1, Nov. 1921, pp. 1-21, 9 figs. Discusses mechanics of motion as applied to brakes and braking, actual brake mechanisms and typical braking systems, including both external contracting and internal expanding types, and brake lining materials

MANUFACTURING PLANTS. A Modern Automobile Plant, Paul L. Battey. Management Engr., vol. 2, no. 3, Mar. 1922, pp. 167-172, 8 figs. Arrangement of departments, routing of product, and means of transportation. (Abstract.) Paper presented to Metropolitan Section of Am. Soc. Mech. Engrs.

The New Plant of the Fisher Body Ohio Co. (Cleveland). Power Plant Eng., vol. 26, no. 4, Feb. 15, 1922, pp. 201-209, 13 figs. Largest single-unit automobile-body manufacturing plant in world. Exemplifies modern construction in its highest degree.

PRESSED-STEEL PARTS. Making Pressed Steel Automobile Parts. Iron Trade Rev., vol. 70, no. 9, Mar. 2, 1922, p. 601-604, 8 figs. Details of plant of the Sharon Pressed Steel Co., Sharon Pa.

REPAIR-SHOP PRACTICE. Automobile Repair Shop Practice. Machy. (N. Y.), vol. 28, nos. 5, 6 and 7, Jan., Feb. and Mar. 1922, pp. 359-362, 468-470, 7 figs. and 567-568, 2 figs. Describes methods and equipment commonly employed. Feb.: Machining pistons. Mar.: Regrinding crankshaft bearings.

STATISTICS. Automobile Statistics. Automotive Industries, vol. 46, no. 7, Feb. 16, 1922, pp. [illegible]. Special number giving statistical data concerning registrations, production, specifications, exports, and general automotive statistics.

AVIATION

COMMERCIAL. Air Lines and Some of Their Problems, R. B. C. Noorduyn. Mech. Eng., vol. 44, no. 2, Feb. 1922, pp. 107-109 and 111. Detailed account of [illegible] commercial aviation in Europe, tracing development from time of post-war experimental work with military machines and fields, to present successful operation with proper machines and schedules and with Government subsidies.

DEAD RECKONING, CHECKING. Methods of Air Navigation, Herbert V. Thaden. [illegible] 1922, pp. 252-255, 6 figs. Formula and [illegible]

RESEARCH. The Progress of Research, R. K. Bagnall-Wild. Engineer, vol. 133, no. 3450, Feb. 10, 1922, pp. 161-162. Research work for air service in Great Britain comprises specific researches at establishments under control of Air Ministry, and in addition an important series of studies carried out in universities by arrangement with the Ministry. Notes on aero-engine research, navigation, and machines. See also Engineering, vol. 113, no. 2929, Feb. 17, 1922, pp. 214-216. Paper read at Air Conference, London.

B

BEAMS

REINFORCED-CONCRETE. The Rapid Calculation of Ferro-Concrete Beams, Auguste Esnouf and Leon Joseph Coutanceau. Engineering, vol. 113, nos. 2928, 2929, 2930 and 2931, Feb. 10, 17, 24 and Mar. 3, 1922, pp. 155-157, 193-195, 221-223 and 273-274, 27 figs. Calculation of T-beam without compressive reinforcement and whose neutral axis is outside slab; T-beams without compressive reinforcement, but with neutral axis inside slab; beams requiring steel in compression; rectangular beams and slabs. Examples taken from bridge practice.

BEARING METALS

ARSENICAL. Arsenical Bearing Metals, Harold J. Roast and Charles F. Pascoe. Min. & Metallurgy, no. 182, Feb. 1922, pp. 63-64. Investigation for purpose of comparing arsenical antimony-lead alloy with some of the regular bearing-metal alloys. (Abstract.) See also Am. Inst. Min. & Met. Engrs. Trans., No. 1136-N, Feb. 1922, 10 pp., 7 figs. (Complete paper.)

BELTING

LEATHER, SPECIFICATIONS. Outline of U. S. Specifications for Leather Belting, R. C. Bowker. Belting, vol. 20, no. 2, Feb. 1922, pp. 30-31. To be used by all government departments, but designed also for all consumers; now before Bureau of the Budget for consideration. (Abstract.) Address before Nat. Assn. Leather Belting Manufacturers.

WIDTH, DETERMINING. Charts for Determining Belt Widths, Thomas J. Cook. Machy. (N. Y.), vol. 28, no. 7, Mar. 1922, pp. 562-564, 3 figs. Presents charts devised by author which, it is claimed, should enable any one to ascertain at a glance the most efficient size of belt to be used for any condition which may arise.

BLOWERS

TURBO. Turbo-Blowers for Mechanical-Draft Applications. Power, vol. 55, no. 8, Feb. 21, 1922, pp. 307-308, 2 figs. Four blowers are worked in parallel and directly connected to turbine operating at 5,000 r.p.m. These machines are applied to both forced- and induced-draft purposes.

BOILER FEEDWATER

AUTOMATIC REGULATION. Automatic Feed Regulation. Mar. Engr. & Naval Architect, vol. 45, no. 533, Feb. 1922, p. 53, 1 fig. on p. 52. Describes the Mumford automatic feedwater regulator now being fitted on White Star liner "Majestic".

PRESENT-DAY. Present-Day Boiler-Room Operation, I. E. Moultrop and R. E. Dillon. Power, vol. 55, no. 10, Mar. 7, 1922, pp. 384-386, 6 figs. Discusses economical loading of turbines and boilers. Paper read before Metropolitan Sections of Am. Soc. Mech. Engrs. and Am. Inst. Elec. Engrs.

BOILER PLANTS

DESIGN. Common Faults in Boiler-Plant Design, George C. Cook. Power, vol. 55, no. 7, Feb. 14, 1922, p. 251. One of most frequent faults is said to be failure to provide sufficient space. Valves should be accessible. Influence of fuel on design.

BOILERS

SCALE REMOVAL WITH CO_2. Removing Boiler Scale with CO_2, R. J. Cross and Roy Irvin. Power, vol. 55, no. 11, Mar. 14, 1922, pp. 422-423, 1 fig. Some scales are removable by carbonated water. Work done with ordinary "soda-fountain" cylinders of liquid carbon dioxide. Preliminary tests easy to make.

SETTING. Large Combustion Chamber in Rear of Boiler, to Which Heated Air Is Admitted, Increases Efficiency, Alphonse F. Brosky. Coal Age, vol. 21 no. 7, Feb. 16, 1922, pp. 288-289, 1 fig. Air heated in flue passing under combustion chamber, is emitted through passages in bridge wall, causing combustion of unburned hydrocarbons and carbon monoxide.

TRIPLE-RIVETED BUTT JOINT. The Designing of a Triple Riveted Butt Joint L. T. Rutledge. Can. Machy., vol. 27, no. 6, Feb. 9, 1922, pp. 17-19, 1 fig. Strength of boiler shell; sketching proposed joint; resistance against tearing and crushing.

UP- VS. DOWN-DRAFT SMOKELESS. Up-Draft Versus Down-Draft smokeless Boilers Heat & Vent. Mag., vol. 19, no. 2, Feb. 1922, pp. 29-30, 1 fig. Air over fire needed only part of time; rate at which air is demanded; value of preheating air

BONUS SYSTEMS

HEAT-TREATING DEPARTMENT. A Successful Bonus System Applied to Heat Treating, A. A. Blue. Am. Soc. for Steel Treating Trans., vol. 2, no. 5, Feb 1922, pp. 430-436, 2 figs. Summarizes general principles and practical detail of a successful tried-out bonus system.

BRAKES

Bus, Hydraulic. Four-Wheel Hydraulic Brake Tried on California Bus. Elec. Ry. Jl. (Bus Transportation), vol. 59, no. 6, Feb. 11, 1922, p. 123. Brake installed in 18-passenger Pierce-Arrow bus by Pickwick Stage Co., Los Angeles, has proved highly satisfactory so far.

BRIDGES, HIGHWAY

Concrete Arch and Girder. Waterproofing, Joints and Drainage in Concrete Bridge. Eng. News-Rec., vol. 88, no. 10, Mar. 9, 1922, pp. 411-413, 2 figs. Details of practical design and construction for both arch and girder types of highway bridges. (Abstract.) Report of Committee on Reinforced-Concrete Highway Bridges and Culverts, before Am. Concrete Inst.

BRIDGES, LIFT

Bascule. New Type of Trunnion Bascule Bridge, Wabash Ry. Eng. News-Rec., vol. 88, no. 9, Mar. 2, 1922, pp. 363-364, 2 figs. Link system in design patented by Hugo Abt connects machinery girder traveling on incline with movable counterweight pivoted to bridge side of tower.

Bascule, Repairing Rolling Parts. Repairing the Rolling Parts of Two Bascule Bridges, J. B. Hunley. Eng. News-Rec., vol. 88, no. 10, Mar. 9, 1922, pp. 414-417, 8 figs. Damage to parts in rolling contact due to excessive bearing pressures producing distortion and crushing of segmental and track girders and excessive wear on tread castings.

BUILDING CODE

Standardization. Standardization of Building Codes. Eng. & Contracting, vol. 57, no. 8, Feb. 22, 1922, pp. 172-173. Suggested outline for standard building code, prepared by R. C. Marshall, Jr., presented before Asso. Gen. Contractors of America.

C

CABLES, ELECTRIC

Telephone. The Lincoln Highway of the Telephone, Harry A. Mount. Sci. Am., vol. 126, no. 3, Mar. 1922, pp. 172-173, 5 figs. Discusses technical difficulties met in laying a giant cable across mountains of Pennsylvania.

CABLEWAYS

Electric Suspension. Electric Suspension Railways with Self-Acting Grippers, P. Stephan. Eng. Progress, vol. 3, no. 2, Feb. 1922, pp. 34-37, 13 figs. Design and method of working. Describes a Bleichert electric grab suspension railway and a conveying plant for coal and coke.

CAISSONS

Sinking. The Successful Sinking of two Great Caissons, Robert G. Skerrett. Compressed Air Mag., vol. 27, no. 11, Feb. 1922, pp. 41-43, 5 figs. Describes construction and sinking of caissons at Spring and at Canal streets, New York City, for Hudson River vehicular tunnel construction.

CAR LIGHTING

Electric. Electric Illumination for Trains, Richard Hanchen. Eng. Progress, vol. 3, no. 1, Jan. 1922, pp. 1-3, 6 figs. Notes on continuous electric train lighting for individual cars; drive of dynamo; voltage control; charging and life of battery; etc.

Principles of Car Lighting by Electricity—XVII, Charles W. T. Stuart. Ry. Elec. Engr., vol. 13, no. 1, Jan. 1922, pp. 9-17, 15 figs. Describes the Gould simplex system of car lighting, consisting of a generator driven by a belt from car axle, a generator regulator panel, a lamp regulator panel mounted in a cabinet inside or under car body, and a storage battery suspended in a box under car body.

CARBON DIOXIDE

Pressure-Total-Heat Diagram. Pressure-Total-Heat Diagram For Carbon Dioxide, H. J. MacIntire. A.S.R.E. Jl., vol. 8, no. 3, Nov. 1921, pp. 211-215, 1 fig. Describes diagram, said to be accurate, clear and workable. Drawn with rectangular co-ordinates, using pressures for ordinates and total heat in B.t.u. above 32 deg. fahr. as abscissae.

CARS

Hose Connectors. Recent Changes in American Hose Connectors. Ry. Age, vol. 72, no. 6, Feb. 11, 1922, pp. 375-377, 4 figs. Describes connector manufactured by Am. Automatic Connector Co., Cleveland, Ohio, and tests made.

The Development of the Robinson Connector. Ry. Mech. Engr., vol. 96, no. 2, Feb. 1922, pp. 77-81, 9 figs. Latest type incorporates improvements suggested by extensive service of earlier design.

CARS, PASSENGER

Articulated Dining. Articulated Units Feature Recent English Car Design. Ry. Rev., vol. 70, no. 4, Jan. 28, 1922, pp. 109-113, 6 figs. Describes new dining-car train, showing advantages of articulated design and use of electricity for cooking.

Sleeping and Compartment. New Sleeping and Compartment Cars for the C.P.R. Ry. Rev., vol. 70, no. 3, Jan. 21, 1922, pp. 77-81, 8 figs. Designed for service on transcontinental trains with spe al regard for comfort of women travelers.

CASE-HARDENING

Cyanamide for. Cyanamide in Liquid Case Hardening, P. W. and E. B. Shimer. Am. Soc. for Steel Treating Trans., vol. 2, no. 5, Feb. 1922, pp. 403-408. Account of experiments made with and description of the Shimer case-hardening process, making use of special lump calcium cyanamide and easily fusible mixture of salts.

Steel, Effect of Quality on. Effect of Quality of Steel on Case-carburizing Results, H. W. McQuaid and E. W. Ehn. Min. & Metallurgy, no. 182, Feb. 1922, pp. 60-61. Writer seeks to prove that presence of excess dissolved oxides in steel, as made in melting furnace, affects permanently results obtained in carburizing and hardening and that it is possible that presence of dissolved oxide can result in total unfitness of low-carbon steel for case-hardening purposes. Abstract.) See also Am. Inst. Min. & Met. Engrs. Trans., no. 1135-S, Feb. 1922, 22 pp., 46 figs. (Complete paper.)

CAST IRON

Gray, Metallography of. Apply Metallography to Gray Iron, J. W. Bolton. Foundry, vol. 50, nos. 2 and 3, Jan. 15 and Feb. 1, 1922, pp. 52-55 and 109-112, 23 figs. Jan. 15: Describes methods of making photomicrographs, including sampling, polishing, etching and photographing. Shows means for identifying the different structures. Feb. 1: Metallurgical control of cupola.

Piping. The Piping of Cast Iron (Ueber das Lunkern von Gusseisen). Giesserei-Zeitung, vol. 19, no. 5, Jan. 31, 1922, pp. 75-81. Discussion of nature and causes of piping. Abstracts of three papers presented before South German Group of Assn. German Foundrymen, followed by discussion.

Welding Without Studding. Welding Cast Iron Without Studding, F. L. Paertch. Welding Engr., vol. 7, no. 2, Feb. 1922, pp. 28-29 (includes discussion). A process which is feasible in some cases but not recommended for strength members and live loads. Paper read before Am. Welding Soc.

CASTING

Centrifugal. Centrifugal Casting, L. Cammen. Chem. & Met. Eng., vol. 26, no. 8, Feb. 22, 1922, pp. 354-358, 4 figs. Describes process of centrifugal casting of hollow metal objects. Mechanics of centrifugal casting.

Steel Mills Rolls. Rolls Molded in Sectional Flasks, J. R. Hadsum. Foundry, vol. 50, no. 5, Mar. 1, 1922, pp. 206-207, 2 figs. Alternative method to sweep molding. Mold finished in sections and clamped together.

Tunnel Segments. Tunnel Segment Casting Methods. Foundry, vol. 50, no. 4, Feb. 15, 1922, pp. 137-141, 6 figs. Discusses technical difficulties in producing castings for lining of vehicular tunnel under Hudson River.

CELLS

Electromotive Force at Low Temperatures. Electromotive Force of Cells at Low Temperatures, G. W. Vinal and F. W. Altrup. Wash. Acad. Sciences Jl., vol. 12, no. 3, Feb. 4, 1922, pp. 64-71, 2 figs. Experimental work to determine open circuit voltage of dry cells at approximately 0 deg. Fahr. and below, and to determine whether dry cells are fit for use after they have been frozen and thawed out again. Observations on storage batteries.

CEMENT, PORTLAND

Development. The Application of the Fundamental Knowledge of Portland Cement to Its Manufacture and Use, P. H. Bates. Jl. Franklin Inst., vol. 193, no. 3, Mar. 1922, pp. 289-309, 6 figs. History of development of Portland cement. Effect of di- and tricalcium on strength. Discussion of investigations by Bur. of Standards and Geophysical Laboratory.

CENTRAL STATIONS

Operating Expenses. Operating Expenses of Six Plants. Elec. World, vol. 79, no. 3, Jan. 21, 1922, pp. 131-132. Study of Massachusetts stations emphasizes advantages of electrical equipment from upkeep standpoint. Data indicate changes which are taking place as result of transition to new industrial basis.

CHARTS

Engineering. Practical Engineering Charts, K. F. Smith. Am. Soc. Naval Engrs. Jl., 34, no. 1, Feb. 1922, pp. 56-72, 4 figs. Describes charts for graphical solution of equations with x and y, or z and w given.

CHUCKS

Magnetic. Direct current or Alternating Current for Magnetic Chucks. (Gleichstrom oder Welchseldtrom für Spamfutter), B. Wittkuhns. Elektrotechnik u. Maschinenbau (Anzeiger), vol. 40, no. 5, Jan. 29, 1922, pp. 21-22. Results of tests made on magnetic chuck for alternating current to determine its properties when compared with d.c. chucks. It is shown that only advantage of a.c. chuck is the instant demagnetization attained with its use, but there are a great many insurmountable disadvantages.

CHROMIUM ALLOYS

Expansibility. Expansibility of Chromium and Nickel-Chromium Alloys in a large Interval of Temperature (Ditalabilité du chrome et des alliages nickel-chrome dans un intervalle étendu de températures), P. Chevenard. Comptes rendus des Séances de l'Academie des Sciences, vol. 174, no. 2, Jan. 9, 1922, pp. 109-112, 2 figs. Describes experiments carried out by means of dilatometer and gives curves resulting.

COAL HANDLING

Equipment. Car Dumper and Coal Conveyors at Coke Oven Plant. Eng. News-Rec., vol. 88, no. 10, Mar. 9, 1922, pp. 407-409, 4 figs. Rotary cradle serves conveying belts. Traveling bridge has belt for storing coal and grab bucket to reclaim it.

Locomotive Loading Plant. Locomotive Coal and Ash Handling Plant. Eng. Rev., vol. 35, no. 7, Jan. 1922, pp. 226-228, 3 figs. Describes plant of Lond. & North Western Ry. Co., capable of loading loconotive in 30 sec.

COILS

Reactance. Result of Short Circuit Tests on Outdoor Type Reactance Coils, A. F. Bang. Elec. World, vol. 79, no. 9, Mar. 4, 1922, pp. 425-428, 6 figs. Tests conducted under artificial rainfall did not cause any flashovers or deformation even under severe short-circuit conditions. Saving effected in building structure by using outdoor type.

COMBUSTION

Control. Gas and Air Mixers for Combustion Control, T. L. Hiles. Forging & Heat Treating, vol. 8, no. 2, Feb. 1922, pp. 124-125. Discusses difficulties in producing a perfect combustible mixture of gas air at burner outlet of a gas furnace.

CONCRETE BLOCKS

Absorptive Qualities. Tests on Absorptive Qualities of Concrete Blocks, Stanton Walker. Eng. News-Rec., vol. 88, no. 7, Feb. 16, 1922, pp. 282-284, 8 figs. Effect of varying aggregate, cement and water content, curing conditions and density observed on small test blocks. (Abstract.) Paper presented before Am. Concrete Pipe Assn. Minn. Section.

CONCRETE CONSTRUCTION, REINFORCED

Slab Design. Graphs and Alignment Charts for the Design of Reinforced Concrete Slabs, Beams and Columns, Joseph W. Dawson. Concrete & Constructional Eng., vol. 17, no. 2, Feb. 1922, pp. 86-92, 6 figs. Presents set of graphs and charts prepared with aim of eliminating as far as possible the laborious calculation usually involved in designing of reinforced concrete construction.

CONDENSERS, STEAM

Spray-Nozzle Cooling of Condenser Water. Spray-Nozzle Cooling Theory and Practice B. H. Coffey and G. S. Dauphine. A.S.R.E. Jl., vol. 8. no. 3, Nov. 1921, pp. 177-202, 6 figs. Discusses the three varieties of variables affecting spray cooling, viz.: independent natural variables which we cannot control; independent artificial variables which we can control; and the final temperature produced by the mutual reactions of the others and, consequently, the dependent variable.

Testing Apparatus. Testing Condenser Apparatus, R. N. Ehrhart. Power vol. 55, no. 7, Feb. 14, 1922, pp. 248-250, 7 figs. How commercial tests are made on ejectors, circulating and condensate pumps.

Tubes. British Standard Specification for Condenser Tubes and Screwed Glands for Condensers for Marine Purposes. British Eng. Standards Assn., no. 145, Oct. 1921, 7 pp. 3 figs. Specifications for quality of material manufacture, dimensions, weight, hydraulic and mechanical tests, inspection and testing facilities.
Properties of Condenser Tubes. Power, vol. 55, no. 9, Feb. 28, 1922, pp. 343-344. Muntz and Admiralty metals are discussed. Effects of internal strains, crystalline structure and thickness of tubes.

CONNECTING RODS

Bearing Machine for. Universal Bearing Machine for Connecting Rods. Western Machy. World, vol. 13, no. 2, Feb. 1922, pp. 48-52, 15 figs. Designed for use in pouring and boring of bearings for automotive connecting rods. Manufactures by Automatic Bearing Machine Co., San Jose.

CONTRACT WORK

Professional Attitude Toward. Defines Professional Attitude Toward Contracting. Eng. News-Rec., vol. 88, no. 9, Mar. 2, 1922, pp. 350-351. Institute of Consulting Engineers distinguishes between professional engineering and contracting functions.

CONVERTERS

Rotary. Rotary Converters and Railway Electrification, F. P. Whitaker. Engineer, vol. 133, no. 3452, Feb. 24, 1922, pp. 221-222, 3 figs. Enumerates characteristics which a converting apparatus for railway substations should possess. Effect of frequency and d.c. voltage on general design; effect of 1500-volt direct current on detail design of converters and on general performance. (Abstract.) Paper read before Instn. Elec. Engrs.

Synchronous. An Analytical Investigation of the Causes of Flashing of Synchronous Converters, F. B. Shand. Am. Inst. Elec. Engrs. Jl., vol. 41, no. 3, Mar. 1922, pp. 175-183, 12 figs. Shows on what factors flashing tendency of synchronous converters depends, and how, an improvement of their momentary overload characteristics can be obtained. From interpretation of a number of oscillograms, and other experimental data, it is shown that a heavy load surge produces unbalanced armature reactions, resulting in abnormal voltage conditions on commutation, which are in turn largely responsible for flash. Means are enumerated by which momentary overload capacity may be increased.

CONVEYORS

Advantages. The Influence of Mechanical Conveyors Upon Financial and Operating Policies, [illegible]. Management Eng., vol. 2, no. 3, Mar. 1922, pp. 133-136, 7 figs. It is pointed out that a completely conveyorized plant automatically secures advantage of cost reduction, speedy delivery to customers, minimum capital investment, and a highly stimulated industrial organization.

Steel-Band. Novel Applications for Thin Steel Bands, Bernard Kruger. Iron Age, vol. 109, no. 10, Mar. 9, 1922, pp. 640-642. Special advantages are said to follow their use for power-transmitting and conveying purposes. Question of tension important. Paper presented before West. Soc. of Engrs.

COPPER ALLOYS

Copper-Tin-Zinc. Copper—88, Tin—10, Zinc—2, R. R. Clarke. Metal Industry (N.Y.), vol. 20, no. 2, Feb. 1922, pp. 56-57, 1 fig. Analysis of properties, idiosyncrases and methods of producing this mixture.

Phosphor-Copper. Phosphoe-Copper, J. L. Jones. Metal Industry (Lond.), vol. 20, no. 7, Feb. 17, 1922, pp. 145-146. Its uses and methods of obtaining best results.

COST ACCOUNTING

Chemical. Some Phases of Chemical Cost Accounting, C. B. E. Rosen. Chem. Age. (N.Y.), vol 29, no. 12, Dec. 1921, pp. 501-104. Discusses the question of process costs and their management.

Machine-Rate. Machine Rate Costing in Engineering Manufacturing Works, G. W. Beale. Jl. Indus. Administration, vol. 1, no 8, Dec. 1921, pp. 246-253. Series of arguments leading to the conclusion that it is not commercially profitable to include machine rate costs in the routine-recorded system of cost accounts of an engineering manufacturing works, but that it finds its true place in estimated costs.

CRANES

Electrical Apparatus for. Selection of Electrical Apparatus for Cranes, R. H. McLain. Am. Inst. Elec. Engrs. Jl., vol. 41, no. 3, Mar. 1922, pp. 249-256. Paper is intended to assist crane designers and electrical engineers in mills and factories to select proper size and kind of motor by mathematical calculation from given data, and refers particularly to electric overhead traveling crane. It is shown how to calculate power required of motor for hoisting and how to select particular kind of motor needed.

Locomotive. Getting the Maximum Performance Out of Locomotive Cranes. Ry. Maintenance Engr., vol. 18, no. 2, Feb. 1922, pp. 49-53, 2 figs. Describes the many purposes for which Lehigh Valley R.R. has found it profitable to use them in maintenance-of-way work.

CRANKPINS

Lubrication. An Analysis of a Point in Crank Lubrication. Automotive Industries, vol. 46, no. 8, Feb. 23, 1922, pp. 462-463, 10 figs. Analytical investigation to determine best location for crankpin oil holes.

CRANKSHAFTS

Balancing Machine. A New Crankshaft Balancing Machine, P. M. Heldt. Automotive Industries, vol. 46, no. 9, Mar. 2, 1922, pp. 518-519, 3 figs. Obviates need for preliminary static balance and permits of quickly determining magnitude and proper angular positions of correcting moments required to insure accurate dynamic balance.

CUPOLAS

Operation and Control. Operation and Control of Cupolas (Conduite et Contrôle des Cubilots), Maurice Bouffart. Fonderie Moderne, no. 12, Dec. 1921, pp. 372-377, 10 figs. Discusses the various chemical and physical measurements including temperature measurements in melting zone and in charge. Read before Congrès de Fonderie de Liége.

D

DAMS

Arch. The Relation Between Deflections and Stresses in Arch Dams, Am. Soc. Civ. Engrs. Proc., vol. 48, no. 2, Feb. 1922, pp. 359-566. Discussson by Albert B. Hill of paper by F. A. Noetzli published in Proceedings of Oct. 1921.

Hetch Hetchy, San Francisco. Construction Features of Hetch Hetchy Dam. Eng. & Contracting vol. 57, no. 10, Mar. 8, 1922, pp. 225-227, 3 figs. Details of construction work of gravity-type dam, principal dimensions of which are given. Notes on spillway; outlet system; stream control during construction; contract prices; excavation for foundations; construction, rock-crushing and concreting plants; cement storage and transportation.

Siphon Spillways. Siphon Spillways, G. F. Stickney. Am. Soc. Civ. Engrs. Proc., vol. 48, no. 2, Feb. 1922, pp. 175-194, 13 figs. Deals with use of siphon for discharging water and for regulating water level at a dam, or in a canal. Describes different types of siphons and gives principles of their operation. Describes various siphon spillways in operation in United States.

DIE CASTING

Uses and Machines for. Die Casting, A. G. Hopking. Instn. Mech. Engrs. Proc., no. 1, 1922, pp. 25-35 and (discussion) 36-40, 7 figs. Deals with uses and advantages; permanent molds; lead base, zinc base, tin base, aluminum base and copper base alloys; design of dies; die-casting machines.

DIESEL ENGINES

Compressors for. The Use of Compressed Air in Diesel Engined Ships, William Reavell. Engineering, vol. 113, no. 2928, Feb. 1922, pp. 179-183, 26 figs. partly on p. 170. (Abstract.) Paper read before North-East Coast Instn. Engrs. & Shipbuilders.

Efficiency. Efficiency of the Diesel Oil Engine, L. H. Morrison. Power, vol. 55, no. 9, Feb. 28, 1922, pp. 340-341, 3 figs. Diesel engine, unlike all other prime movers, is thermally more efficient at part loads, reason for which is explained.

Marine. Some Problems of Marine Diesel Engine Design, P. Belyavin. North-East Coast Instn. Engrs. & Shipbuilders, advance proof, no. 2211-Q, for meeting Feb. 24, 1922, pp., 25 figs. Discusses important points which have a substantial influence on size, cost and weight of multi-cylinder, two-stroke-cycle Diesel engine.

DRAINAGE

Maintenance of Drains. Methods and Cost of Maintenance of Drains on U.S. Reclamation Service Projects, C. L. Leunsberry. Eng. & Contracting, vol. 57, no. 10, Mar. 8, 1922, pp. 235-236. Information on maintenance of open and tile drains on irrigation projects of U.S. Reclamation Service, abstracted from Reclamation Record, Jan. 1922.

DRILLS

Diamond. The Diamond Drill in Oil Prospecting. Petroleum Times, vol. 7, no. 160, Jan. 28, 1922, pp. 116. Discusses increased prospecting possibilities due to application of diamond drill.

DROP FORGINGS

Heat Treatment. Heat-Treatment of Drop-forgings. Machy. (Lond.), vol. 19, no. 488. Feb. 2, 1922, pp. 554-557, 5 figs. Practice followed and equipment empoyed, with special reference to furnace design and suitable fuels.

Perfecting. Perfecting a Drop Forging, J. H. G. Williams. Am. Soc. for Steel Treating Trans., vol. 2, no. 5, Feb. 1922, pp. 390-395, 13 figs. Includes photographs, showing how metal did not flow in manner originally planned, and discusses methods used for removing conditions promoting formation of defects.

DURALUMIN

Gear Material. Duralumin and Its Use as a Gear Material, Robert W. Daniels Machy. (N. Y.), vol. 28, no. 7, Mar. 1922, pp. 542-643. Notes on physical properties and general characteristics of duralumin; process of manufacture. It is said to be an ideal material for worm wheels. (Abstract.) Paper read before Am. Gear Mfrs. Assn.

DYNAMOMETERS

Hydraulic Traction. The Polak Hydraulic Traction Dynamometers. Engineering, vol. 113, no. 2931, Mar. 3, 1922, p. 256, 4 figs. Describes instrument designed by M. W. Polak, Holland, for testing agricultural machinery. It does not draw a curve, but measures average drawbar pull during certain periods, mostly of 20 sec.

E

EDUCATION

American, Foreign Criticism of. Foreign Criticism of American Education, W. J. Osburn. U. S. Dept. of Interior, Bur. of Education Bul., no. 8, 1921, 156 pp. Contains extracts of reports made by educators and critics of education from other countries who have visited American schools, usually for purpose of gaining such information and ideas as would be helpful to them in improvement of schools of their countries.

EDUCATION, ENGINEERING

Industries. Professional Engineering Education for the Industries, Francis C. Pratt. Eng. Education, vol. 12, no. 5, Jan. 1922, pp. 227-233. Discusses American methods of engineering education, based on result of careful study of large number of college graduates at works of Gen. Elec. Co. Writer is against too early specialization of student, resulting in turning out a disproportionate number of men or mediocre ability and narrowly specialized education.

Metallurgical Course. A University Course in Metallurgical Engineering, W. P. Wood. Am. Soc. for Steel Treating Trans., vol. 2, no. 5, Feb. 1922, pp. 423-425. Presents curriculum prepared by author having in mind preparation of students for those industries which are concerned with final shaping and preparing of metal for use.

Mining Curriculum. The Mining Curriculum at Lehigh University, George J. Young. Eng. & Min. Jl, vol. 113, no. 6, Feb. 11, 1922, pp. 239-242, 8 figs. partly on p. 238. Discusses curriculum.

EDUCATION, INDUSTRIAL

Industries and Railroads. A Review of Industrial Education and Training. Mech. Eng., vol. 44, no. 2, Feb. 1922, pp. 87-92. Education and Training in the Industries, R. L. Sackett. Education and Training on Railroads, D. C. Buell. Discussion.

ELECTRIC CIRCUITS

Protection by Cutouts. Cutouts in Motor Circuits and Their Location, Edgar P. Slack. Power, vol. 55, no. 10, Mar. 7, 1922, pp. 381-382, 5 figs. Where to place fuses or circuit breakers to protect circuits on which motors or other electrical devices operate to prevent fire and accident hazards.

ELECTRIC CONDUCTORS

Iron vs. Copper Wire. Iron Wire Versus Copper as an Electrical Conductor, W. E. Rice. Elec. World, vol. 79, no. 7, Feb. 18, 1922, pp. 331-332. Construction and mechanical difficulties of changing from iron to copper conductors. Practicability of iron lines. Discussed before N.E.L.A.

ELECTRIC DRIVE

Machine-Tool Shop. Individual Electric Drive in a Machine Tool Shop (La commande électrique individuelle dans un atelier de machines-outils), R. Micheau. Arts et Métiers, vol. 74, no. 10, July 1921, pp. 203-212, 25 figs. Deals with single-pulley drives, cone-pulley drives, and multiple-shaft drives, and their difficulties

ELECTRIC FURNACES

Electromagnetic Motions in. Electromagnetic Motions in Electric Furnaces, Carl Hering. Am. Electrochem. Soc. advance paper, no. 2, for meeting Apr. 27-29, 1922, pp. 7-14. Describes how new proposed law given in former paper may be applied to production, by the current, of certain desired motions such as those for circulating or stirring liquid conductors in a furnace.

Future Applications. The Electric Furnace Situation. Blast Furnace & Steel Plant, vol. 10, no. 2, Feb. 1922, pp. 137-139. Deals with widening of sphere of electric furnace's operation, including production of cast iron.

Gray Iron Castings. Electric Furnace Strengthens Iron, D. Wilkinson. Foundry vol. 50, no. 4, Feb. 15, 1922, pp. 143-145. Reviews work on production of synthetic pig iron, and describes an inexpensive type of electric furnace for gray-iron castings.

Iron Smelting. Electric Iron Smelting. Pacific Mar. Rev., vol. 19, no. 2, Feb. 1922, pp. 126-128, 2 figs. Describes "Elektrometalls" process as carried out at Tröllhattan Falls, Sweden, based on inventions made by Gronwall, Lindblad and Stalhane.

Italian Design. Italian Firm Designs An Electric Furnace. Foundry, vol. 50, no. 5, Mar. 1, 1922, p. 177, 1 fig. Describes electric Furnaces placed on market by Fiat Corp., Italian automobile builder producing 1,000 metric tons of finished steel per month.

ELECTRIC GENERATORS, D.C.

Flux Distribution in Air Gap and Teeth. Flux Distribution in Air Gap and Teeth of Dynamos, Alfred Still. Electrician, vol. 88, nos. 2282 and 2283, Feb. 10 and 17, 1922, pp. 152-153 and 187-188, 7 figs. Discusses permeance of air paths, air gap, conditions in highly saturated teeth. Calculations of tooth density in terms of air gap density and m.m.f., with correction for tapering of teeth, illustrated by numerical example.

ELECTRIC LOCOMOTIVES

Chile. Passenger Locomotives for Chilean State Railways. Elec. Ry. Jl., vol. 59, no. 8, Feb. 25, 1922, pp. 309-314, 18 figs. partly on p. 308. Describes electric locomotives for express and local service on line under electrification between Valparaiso and Santiago. See also Ry. Age, vol. 72, no. 9, Mar. 4, 1922, pp. 527-528, 3 figs.

ELECTRIC MOTORS

Railway, Heating of. Heating of Railway Motors in Service and on Test-Floor Runs, G. E. Luke. Am. Inst. Elec. Engrs. Jl. vol. 41, no. 43, Mar. 1922, pp. 165-173, 7 figs. Notes on heating and cooling characteristics of railway motors. Brief analysis of heating at standard ratings is given. Fundamental equations defining temperature rise of a motor on continuous or short-time load are developed, and applications of these equations are made in several specific examples. Bibliography.

ELECTRIC RESISTANCE
